Index—California and Western Medicine, Volume 49
July to December, 1938

INDEX ARRANGEMENT

Sequence of Subheads in Index

This index is arranged under the following headings:

I. Authors.
II. Subjects—Titles of papers.
III. Editorials.
IV. Editorial Comment articles.
V. Bedside Medicine articles.
VI. Medical History articles.
VII. Miscellany columns.
VIII. California Medical Association.
 (a) General.
 (b) Component County Societies.
 (c) Department of Public Relations.
 (d) Woman's Auxiliary.
IX. Deceased members.
X. Book Reviews.
XI. Report of Medical Examiners.

Key to Abbreviations in This Index

Or.—Original Article.
C. R.—Case Report.
B. M.—Bedside Medicine.
Ed.—Editorial.
E. C.—Editorial Comment.
C. N.—Clinical Notes.
L. M. H.—Lure of Medical History.
Sup.—Supplement (by month).

Index to Pages, Volume 49, California and Western Medicine, July to December, 1938

Date of Issue	No. of Pages
July	1–104
August	105–176
September	177–248
October	249–352
Supplement: Five-Year Study Program for Graduates in Medicine, Program II	1–16
November	353–424
December	425–504

Two Volumes Yearly

CALIFORNIA AND WESTERN MEDICINE is issued annually in two volumes: the first, from January to June, inclusive; and the second from July to December, inclusive.

Attached to the current volume (Volume 49) was one supplement, as follows: October issue, supplement on Five-Year Study Program for Graduates in Medicine, Program II.

American Medical Association Quarterly Cumulative Index

Members who wish to consult a general medical index are referred to the Quarterly Cumulative Index of the American Medical Association.

I

AUTHORS—INDEX

A — PAGE

Abbott, LeRoy C.—Acute Noninfectious Bursitis (B. M.) 314
Adelstein, Leo J.—Surgical Treatment of Hypertension (E. C.) 109

B

Bailey, Wilhur, and Carter, Ray A.—Anomalies of the Spine (Or.) 46
Bakewell, Benjamin—Obstetric Observations (Or.) 268
Bartlett, Edwin I.—Trauma and Malignancy (Or.) 132
Benteen, Harry, and Stephens, H. Brodie—Muscle Grafts: In the Surgery of the Heart and Lungs (Or.) 366
Bernstein, Abraham—The Talmud a Medical Laboratory (L. M. H.) 308
Best, Elbridge J.—The Doctor's Responsibility Regarding the Humane Pound Act (E. C.) 254
Billingsley, G. D., and Templeton, H. J.—Human Myiasis (C. R.) 58
Bingham, E. M., and Blevins, W. J., Jr.—Hematocolpos Due to Imperforate Hymen (C. R.) 147
Blaisdell, Paul C.—The Origin and Treatment of Anorectal Fistulae (B. M.) 466
Blevins, W. J., Jr., and Bingham, E. M.—Hematocolpos Due to Imperforate Hymen (C. R.) 147
Boeck, William C.—Gastric Ulcer: Indications for Medical and Surgical Treatment (Or.) 281
Bost, Frederic C.—The Importance of the Emergency Treatment of Compound Fractures (Or.) 185
Briesen, Hans von—Intracranial Tumors (C. R.) 462
Brockway, Alvia—How Safe is the Operation for Lengthening Legs? (E. C.) 4
Brown, Philip King—Sulfanilamid: A Specific for the Friedlander Bacillus (C. R.) 144
Brunie, Leonard J.—Geriatrics (Or.) 369
Butler, F. O.—State-wide Mental Hygiene Program: Its Importance to California (Or.) 11

C

Carr, Jesse L., and Geiger, J. C.—Necropsies in Hospitals in San Francisco (C. N.) 144
Carroll, Robert L.—Bone Tumors (B. M.) 64
Carter, Ray A., and Bailey, Wilbur—Anomalies of the Spine (Or.) 46
Charnock, Donald A.—Water Exchange in Surgical Cases (Or.) 287
Clark, Howard E.—Pseudo-proptosis from Subconjunctival Tumors (C. R.) 142
Cohlentz, Lambert B., and Moore, Ferrall H.—Polycythemia Vera of the Geisböck Type (C. R.) 148
Costolow, William E.—Cancer of the Skin (B. M.) 389

D

Dakin, Wirt B.:
 Believe-It-Or-Nots in Urology (Or.) 135
 Social Security: In Relation to the Physician (Or.) 300
Daniel, William H.—The Origin and Treatment of Anorectal Fistulae (B. M.) 468
Davis, Kenneth S.—Bone Tumors (B. M.) 66
Deamer, William C., Jenkins, Harry L., and Lazarus, Dorothy Scott—Pollen Survey (Or.) 450
Diefenbach, W. E., and Yuskis, Anton S.—Typhoid Septicemia Treated with Sulfanilamid (C. R.) 146
Dolley, Frank S., Jones, John C., and Skillen, Jane—Extrapleural Pneumothorax (E. C.) 255

E

Eaton, Chelsea—Anal Resectoscope (C. N.) 59
Evans, George H.—Plague Epidemics in San Francisco: Historical Notes (L. M. H.):
 Part I 383
 Part II 458
Ewer, John N.—Hemorrhage from the Uterus (B. M.) 150

F — PAGE

Fine, Max—Corneal Transplantation (C. N.) 60
Fluhman, C. F.—Estrogenic Hormones: Their Clinical Usage (Or.) 362
Frankel, Leon, and McGovern, Bernard E.—Influenzal Bronchopneumonia (C. R.) 61
Friedlander, Richard D.—Acquired Lesions of the Tricuspid Valve (E. C.) 110

G

Garland, L. H.—Roentgen Treatment of Certain Hemorrhagic Disorders (Or.) 123
Garth, William LeRoy—Anesthesia in Europe (Or.) 112
Geiger, J. C.:
 Food-Handler Examinations (C. N.) 312
 The "Scoop" as a Source of Bacterial Contamination of Ice Cream (E. C.) 357
Geiger, J. C., and Carr, Jesse L.—Necropsies in Hospitals in San Francisco (C. N.) 144
Geiger, J. C., Miller, Roslyn, and Welke, Hilda F.—Chronically Ill and Convalescent Patients: Their Care in Institutions (Or.) 430
Geiger, J. C., and Rusk, G. Y.—Human Rabies in California (Or.) 197
Gilcreest, Edgar Lorrington—Rockefeller, Osler, and Welch (L. M. H.) 210
Gillett, R. E.—Sulfanilamid: Its Use in Upper Genital Tract Infections in the Female (Or.) 206
Gocher, T. E. P.—Acute Noninfectious Bursitis (B. M.) 315
Goin, Lowell S.—X-ray Therapy for Sinusitis (E. C.) 428
Goldberg, Albert T., and Schatz, Milton M.—Artificial Insemination (C. R.) 212
Gregg, Harold J., and Gregg, Fred C.—Pregnancy Following Operation for Chronic Inversion of the Uterus (C. N.) 464
Gundrum, F. F., and Keifer, H. H.—Sarcophagid Myiasis (C. R.) 147

H

Hale, Nathan G.—Health Protection and Care for the Less Than Two Thousand Dollar Group (Or.) 372
Hand, Frank—Ear Manifestations Following Head Injuries (Or.) 42
Hanzlik, P. J.:
 Purkinje's Pioneer Self-Experiments in Psychopharmacology (L. M. H.):
 Part I 52
 Part II 140
 Use of Dogs in Developing Treatment of War Gas Poisoning (Or.) 182
Harris, Harold I.—Meckel's Diverticulum (C. R.) 386
Hassard, Howard, and Peart, Hartley F.—Medical Society Membership: Some Legal Phases (Or.) 382
Hayden, Charles Thomas—Roentgen-Ray Pelvimetry (Or.) 25
Helsley, Gordon F.—The Origin and Treatment of Anorectal Fistulae (B. M.) 467
Higby, W. F.—California's Fight Against Tuberculosis (E. C.) 429
Hirschfeld, Mervyn H.—Prevention of Mental Disease (B. M.) 219
Hohmaier, M.—Diphyllobothrium Larvae in Trout of California Waters (E. C.) 111
Houck, George Hamilton—Intratracheal Instillation of Liquid Petrolatum: Pulmonary Injury Therefrom (Or.) 187
Hough, Ricta C., and Walsh, Michael J.—The Value of Diet Analysis in Pediatric Practice (Or.) 374
Hyland, Clarence M., and Palmer, Jay J.—Miliary Tuberculosis with Death at Age of Eighteen Days (C. R.) 384

BUTLER BUILDING

" . . . is so handy for all my patients, and that's why I moved my offices here."

Call at the building . . . or Telephone DOuglas 5686

At Geary and Stockton Streets, right next to Union Square, the Butler Building is indeed handy —for it is in the very heart of the downtown shopping district.

Equipped to meet the requirements of the medical profession, the offices — single or in suite — are light, airy, and comfortable. Up-to-the-minute elevator facilities are appreciated by tenants and visiting patients alike.

Why don't you come into the building and look it over? Or call on

Buckbee Thorne & Co.

PARKE-DAVIS THEELIN AND KAPSEALS THEELOL

Theelin, introduced to the medical profession in January, 1931, by Parke, Davis & Company, marked a new phase in endocrine therapy. This active estrogenic substance was isolated and identified both chemically and pharmacologically by Dr. E. A. Doisy of St. Louis University. Subsequently Dr. Doisy isolated Theelol, a related product. The further development of these two preparations for clinical application was carried out through cooperative work on the part of the staffs of the Research Laboratory and the Department of Experimental Medicine of Parke, Davis & Company.

Theelin (ketohydroxyestratriene) for intramuscular administration, and Theelol (trihydroxyestratriene) for oral use, are chemically pure estrogenic substances rigidly standardized by physiological and chemical methods. To facilitate proper dosage, the following package forms are available:

FOR INTRAMUSCULAR ADMINISTRATION

THEELIN (AQUEOUS) AMPOULES
0.02 mg.—200 international units
(Ampoule No. 167)

THEELIN IN OIL AMPOULES
0.2 mg.—2000 international units
(Ampoule No. 179)

THEELIN IN OIL AMPOULES
0.1 mg.—1000 international units
(Ampoule No. 178)

THEELIN IN OIL AMPOULES
1.0 mg.—10,000 international units
(Ampoule No. 182)

Supplied in boxes of six and fifty 1-cc. ampoules.

FOR VAGINAL ADMINISTRATION

THEELIN VAGINAL SUPPOSITORIES
0.2 mg.—2000 international units

Supplied in boxes of six suppositories.

FOR ORAL ADMINISTRATION

KAPSEALS THEELOL
0.06 mg. (No. 353)

KAPSEALS THEELOL
0.12 mg. (No. 358)

Supplied in bottles of 20, 100 and 250.

Descriptive literature, discussing these products in detail, is available on request.

The Committee on Public Relations consists of the chairmen of the following standing committees and of certain general officers of the Association, all serving ex officio. The chairman of the committee is George G. Reinle, the secretary is George H. Kress. The director of the Department of Public Relations is George H. Kress. The chairman of the Committee on Public Relations is ex officio a member of the Council.

Fred B. Clarke.....Chair., Com. on Health and Public Instruction
Daniel Crosby.....Chair., Com. on Hospitals, Dispensaries, Clinics
Morton R. Gibbons.....Chair., Com. on Industrial Practice
George D. Maner....Chair., Com. on Membership and Organization
John H. Graves.....Chair., Com. on Medical Economics
Junius B. Harris.....Chair., Com. on Public Policy and Legislation
George G. Reinle.....Chair., Cancer Commission
John C. Ruddock.....Chair., Com. on Postgraduate Activities
William W. Roblee.....President of California Medical Association
Charles A. Dukes.....President-elect
George H. Kress.....Secretary-Treasurer

Communications for the Public Relations Department should be addressed to the Director, George H. Kress, M. D., Room 2004, 450 Sutter Street, San Francisco.

Cancer Commission

Alson R. Kilgore (Chairman)	San Francisco	1939
Henry J. Ullmann	Santa Barbara	1939
Clarence G. Toland	Los Angeles	1939
George G. Reinle	Oakland	1940
Lyell C. Kinney (Vice-Chairman)	San Diego	1940
Otto H. Pflueger (Secretary)	San Francisco	1940
Orville Meland (Sec'y for Southern Section)	Los Angeles	1941
A. Herman Zeiler	Los Angeles	1941
Gertrude Moore	Oakland	1941

Communications for the Cancer Commission should be addressed to the Secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

(Roster lists of officers of scientific section, component county societies, Woman's Auxiliary, A. M. A. delegates, special committees, etc., are continued on advertising pages 4 and 6.)

THE members of the California Sales Organization of LUZIER'S, Inc., Makers of Fine Cosmetics, sincerely hope that you, the members of the California Medical Association, will visit the Luzier Booth at the coming national convention of the American Medical Association.

We will have a large display featuring all of the preparations manufactured by LUZIER'S, Inc. Our Service will be featured as **"Individually Nonallergenic,"** by which is meant simply this: In cases where the offending substances have been determined, and should they appear in our preparations, the chances are we can substitute other ingredients, thereby making our preparations nonallergenic so far as a particular person is concerned—in other words, **individually** nonallergenic. Our preparations do not contain the common offending substances, such as orris root, rice starch, etc.

It is our wish to coöperate with the medical profession to the full extent of our limited scope, and we sincerely hope through our appeal to your profession that we may enlist your coöperation in bringing to the public fine cosmetics that are safe to use.

LUZIER'S, INC. MAKERS OF FINE COSMETICS

KANSAS CITY, MISSOURI

Climate and Tuberculosis.—There was a time when a change of climate was almost always recommended for tuberculosis. People believed that certain climates cured this disease. They thought that dry air or mountain air or warm or cold air was better than some other kind of air. Medical opinion has changed and it is no longer believed that climate will cure tuberculosis. It is now asked where treatment can be obtained of the kind required and within the means of the patient. A child or an aged person is seldom sent away; a young man or woman may occasionally be advised to go away, but only if there is good reason for it. The most important thing is good medical care, usually in a sanatorium, no matter what the climate is.

Skillful doctors and nurses and good sanatoria can be found in almost every state, and, as for climate, no state in the Union has found it necessary to go outside its borders to locate its state sanatorium.

Summer Diarrhea in Babies.—Casec (calcium caseinate), which is almost wholly a combination of protein and calcium, offers a quickly effective method of treating all types of diarrhea, both in bottle-fed and breast-fed infants. For the former, the carbohydrate is temporarily omitted from the 24-hour formula and replaced with eight level tablespoonfuls of Casec. Within a day or two the diarrhea will usually be arrested, and carbohydrate in the form of Dextri-Maltose may safely be added to the formula and the Casec gradually eliminated. Three to six teaspoonfuls of a thin paste of Casec and water, given before each nursing, is well indicated for loose stools in breast-fed babies. For further information write to Mead Johnson & Company, Evansville, Indiana.

"He who fears criticism is hopeless. Only those who do things are criticized. The idler is lost sight of in the march of events, but the doer is watched and criticized. Take your part in life's stage and play your part to the end; stand for what is good; be a doer, not a drone; look the world in the face and let the critics criticize."—*Thomas Jefferson.*

ISOPHRIN

TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel Laboratories.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

(Roster lists continued on advertising page 6)

THE use of cow's milk, water and carbohydrate mixtures represents the one system of infant feeding that consistently, for three decades, has received universal pediatric recognition. No carbohydrate employed in this system of infant feeding enjoys so rich and enduring a background of authoritative clinical experience as Dextri-Maltose.

15 U.S.P. Units in each cc. of

1cc. Concentrated Solution Liver Extract
(PARENTERAL)

Lederle

PREVIOUS CLAIMS for high potency per cubic centimeter of Lederle's "1 cc. Concentrated Solution Liver Extract Parenteral" have been established by the action of the U.S.P. Anti-Anemia Preparations Advisory Board.

"1 cc. Concentrated Solution Liver Extract *Lederle*" has been tested in accordance with the methods described by the U.S.P. (a similar procedure has been prescribed by the Council on Pharmacy and Chemistry) and it has been determined that 0.067 cc. per day for the test period produces the required hematopoietic response. Each 1 cc. vial of the extract, therefore, contains

Reproduced from section devoted to 'Pernicious Anemia' shown at the Lederle exhibit, A. M. A. Convention, San Francisco, Cal., June 13 to 17, 1938.

15 U.S.P. UNITS

Since "liver extracts" are labeled to indicate unitage, the physician may now proceed with parenteral liver therapy, using preparations whose potencies are expressed in terms of U.S.P. units.

Advantages of "1 cc. Concentrated Solution Liver Extract (Parenteral) *Lederle*":

—a high degree of therapeutic effectiveness with a minimum of discomfort from each injection;

—relatively long intervals (7 to 20 or more days) between injections.

Available only in boxes of 3—1 cc. vials.

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY—FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*

RHUS VENENATA ANTIGEN

(Poison Oak Antigen)

Williams and MacGregor report "The most striking feature was the rapid improvement, usually after a single dose . . ." In their series of twenty-six patients from the New York Skin and Cancer Hospital, only one patient failed to show improvement until the third dose was given. Williams concludes, "The results to be obtained by this method are nothing less than brilliant."

The Antigens reported by Strickler, Williams, MacGregor, and Bivings are made exclusively by The Mulford Colloid Laboratories, U. S. Government License No. 102, and are accepted by The Council on Pharmacy and Chemistry of The American Medical Association.

Smallpox in the Seventies: Report of the Health Officer of San Francisco in 1877.—The effectiveness of vaccination in the control of smallpox is brought sharply into focus through knowledge of the terrific damage inflicted by this disease in the days when vaccination was not carried on as a routine procedure in public health administration. The following report of the health officer of San Francisco in 1877 shows clearly that smallpox as it existed at that time constituted a major problem in public health (it should be noted here that in all of California, in 1937, there were reported 697 cases of smallpox with three deaths):

"From the 19th of May, 1876, to July 1, 1877, there were 1,646 cases of smallpox reported at the health office. Of this number, 898 were sent to the Twenty-sixth Street Hospital. Of the whole number, 482 died—255 at the hospital and 227 in the city—the percentage of deaths at the hospital being 28.4; in the city, 28.9. It must be remembered, however, that among the deaths in the city are included sixty Chinamen, reported after death. Of the seventeen Chinamen who died at the hospital, a few were reported and the others discovered before death. As smallpox is much more fatal among children than adults, and as there are but few children among the Chinese, comparatively, the inference is natural and just that, in proportion to the number of cases, there were fewer deaths than among the whites. Certainly, there could not have been less than three hundred cases concealed by the Chinese, which, added to the entire number reported at the health office, would increase the total number of cases to 1,946, exceeding the number reported during the epidemic of 1868 and 1869 by thirty-seven. At that time the estimated Chinese population was only 4,000, and very few cases occurred among them. The cause and history of this epidemic is a matter of so much importance that I beg leave to reproduce and reiterate some of the views expressed by me in my report to the honorable board of health, September 12, 1876.

"On the 19th of May, 1876, the first case of smallpox was reported. Within a few days twelve other cases were reported in various portions of the city, occurring for the most part in respectable families, without any known exposure, and of a very severe type. Satisfied in my own mind that all unprotected persons in the city were liable to contract the disease by the same insidious and unknown cause that had stricken down the thirteen reported cases, I then stated to your honorable body that I believed we were in danger of an alarming epidemic, and advised the appointment of public vaccinators. The idea of an epidemic was so ridiculed by correspondents of the press and others, improper motives even being imputed to me for expressing, as health officer, my fear of such a contingency, that the people soon ceased to apply to the vaccinators in such numbers as to warrant a continuance of their commissions, and they were accordingly withdrawn in two weeks. In the meantime vaccination was continued at the health office daily, and up to the 1st of July about 8,000 persons had been vaccinated, under the auspices of this department. Even on the 1st of July it was generally denied to be epidemic, notwithstanding the fact that 139 cases had been reported, seventy-two of which had occurred in the last twelve days of June. From this time on the disease increased so rapidly that its existence as an epidemic soon became patent to all. Vaccinators were again appointed, and such was the eagerness for vaccination that it was impossible for a few days to obtain a sufficient quantity of pure virus to vaccinate all the applicants."

Our country can probably boast of no more courageous a set of heroes than her gallant men who bend over her laboratory test tubes; the sword of science is at constant duel with the physical demons that plague mankind.

"Every physician is a member of the volunteer army of guardians of health in all its phases, private and public. He cannot afford to divorce his private practice from that of public health; for when he does so, other agencies are ready to displace him from even his private practice."—*Journal of the Medical Society of New Jersey.*

Physicians may now obtain SMAco Nicotinic Acid (3:Pyridine Carboxylic Acid) for clinical experimentation in tablet form for oral administration. Two potencies are available: 100 milligrams per tablet, or 20 milligrams per tablet.

SMAco Nicotinic Acid (3 : Pyridine Carboxylic Acid) Tablets, of both potencies, are scored permitting a wide flexibility in dosage. Tablets may be broken in two parts at the score, enabling the physician to administer any multiple of 10 milligrams as a dose.

SMAco Nicotinic Acid (3 : Pyridine Carboxylic Acid) is available in tablet form in the following packages:

	LIST No.
100-Milligram tablets, bottles of 20	7331
100-Milligram tablets, bottles of 200	7333
20-Milligram tablets, bottles of 50	7311
20-Milligram tablets, bottles of 500	7315

You may have your pharmacist order any of the above packages in the regular way, or you may order Clinical Trial Packages as follows direct from us: Address Department 22–78.

		RETAIL
100-Mg. tablets, bottle of 20	(SMAco 7331)	$1.50

Two principles govern the moral and intellectual world. One is perpetual progress, the other the necessary limitations to that progress. If the former alone prevailed, there would be nothing steadfast and durable on earth, and the whole of social life would be the sport of winds and waves. If the latter had exclusive sway, or even if it obtained a mischievous preponderancy, everything would petrify or rot. The best ages of the world are those in which these two principles are the most equally balanced. In such ages every enlightened man ought to adopt both principles, and with one hand develop what he can, with the other restrain and uphold what he ought.—Gentz.

The most fruitful experience in life arises when the inquiring mind comes under the influence of the skillful teacher. Some day the student so blessed may look back with wondering gratitude upon the transforming hands once laid upon him.

Education in Health.—There is a renewed interest in health education in the schools and the importance of instruction in hygiene and allied subjects is recognized generally. Dr. J. Howard Beard of the University of Illinois has prescribed qualifications for teachers of hygiene in high schools that provide the essentials in training. They are:

1. A thorough background of the fundamental sciences of biology, chemistry, and physics.
2. Knowledge of physiology, bacteriology, psychology, sociology, and economics.
3. An understanding of the principles, psychology, and philosophy of education.
4. Thorough contact with proper facilities for instruction.
5. A fixed determination to keep up with the rapid progress and changes of preventive medicine and sanitary engineering, which make it possible for man to control his environment and adjust himself to it.

Dr. Beard adds:

"The teacher should not only be well trained, but should be interested in students, sympathetic with their problems, and be able to see in proper perspective the relation of hygiene to personal welfare and social progress. He should be emotionally mature and an example of health in the broad sense of living most and serving best. He should be able to deal with facts and reality with optimism and poise. His personality should be sufficiently dynamic to make his teaching effective and his character should be rich in courage, fairness, magnanimity, kindliness, and courtesy.

"The curricula of many colleges and universities offer the prospective teacher of hygiene an opportunity to get the background of science, pedagogy and education essential to teach health to high-school students who tomorrow will be determining the destiny of their communities. The demands of our complex society preclude the drafting of the poorly prepared pedagogic 'Jack of all trades' to teach a subject which is to provide individuals with knowledge essential to protect themselves, to safeguard their families and to function intelligently as citizens in the promotion of the general welfare."

Whenever any disease is so widespread in the population, so serious in its effects, so costly in its treatment that the individual, unaided, cannot deal with it himself, it becomes a public health problem.—Surgeon-General Thomas Parran in *The Health Officer.*

BOOK REVIEWS

Books received for review are placed in the Library of the California Medical Association, in its central office at San Francisco. Book reviews are written by the Association Secretary.

BOOKS RECEIVED

Materia Medica Drug Administration and Prescription Writing. By Oscar W. Bethea, M. D., Ph. G., Ph. M., F. C. S., F. A. C. P., Professor of Clinical Medicine, Tulane School of Medicine; Professor of Therapeutics, Tulane Graduate School of Medicine; Senior Physician, Southern Baptist Hospital (New Orleans); Senior Visiting Physician, Charity Hospital of Louisiana; Member of Revision Committee, United States Pharmacopoeia, etc. Fifth Revised Edition. Cloth. Pp. 577. Price, $5. Philadelphia: F. A. Davis Company, 1938.

Injection Treatment of Varicose Veins and Hemorrhoids. By H. O. McPheeters, M. D., F. A. C. S., Formerly Director of the Varicose Vein and Ulcer Clinic, Minneapolis General Hospital; Attending Physician, New Asbury, Fairview and Northwestern Hospitals, Minneapolis, and James Kerr Anderson, M. D., F. A. C. S., Instructor in Surgery, University of Minnesota School of Medicine; Fellow, American Proctologic Society; Adjunct Surgeon, Minneapolis General Hospitals; Attending Surgeon, St. Marys, Abbott and Northwestern Hospitals, Minneapolis, Minnesota. Cloth. Pp. 315, illustrated with eighty-two halftones and line engravings. Price, $4.50. Philadelphia: F. A. Davis Company, 1938.

The New International Clinics. Original Contributions: Clinics; and Evaluated Reviews of Current Advances in the Medical Arts. Edited by George Morris Piersol, M. D., Professor of Medicine, Graduate School of Medicine, University of Pennsylvania, Philadelphia. Volume 2, New Series One (old forty-eighth). Cloth. Pp. 315. Philadelphia: J. B. Lippincott, 1938.

The Romance of Proctology. Which is the story of the history and development of this much-neglected branch of surgery from its earliest times to the present day, including brief biographic sketches of those who were its pioneers. By Charles Elton Blanchard, M. D. Cloth. Pp. 284. Price, $4.50. Youngstown: Medical Success Press, 1938.

Medical State Board Questions and Answers. By R. Max Goepp, M. D., Formerly Professor of Clinical Medicine in the Graduate School of Medicine, University of Pennsylvania; Formerly Assistant Professor of Clinical Medicine, Jefferson Medical College; Formerly Assistant Visiting Physician, Philadelphia General Hospital; Formerly Professor of Medicine, Woman's Medical College of Pennsylvania. Seventh Edition, Revised. Cloth. Pp. 644. Price, $5.50 net. Philadelphia: W. B. Saunders Company, 1938.

New and Nonofficial Remedies, 1938. Containing Descriptions of the Articles Which Stand Accepted by the Council on Pharmacy and Chemistry of the American Medical Association on January 1, 1938. Cloth. Pp. 657. Chicago: American Medical Association, 1938.

Annual Reprint of the Reports of the Council on Pharmacy and Chemistry of the American Medical Association for 1937, with the Comments That Have Appeared in the Journal. Cloth. Pp. 201. Chicago: American Medical Association, 1938.

A Synopsis of the Diagnosis of the Acute Surgical Diseases of the Abdomen. By John A. Hardy, B. Sc., M. D., F. A. C. S., El Paso, Texas. Cloth. Pp. 345, with ninety-two illustrations. Price, $4.50. St. Louis: The C. V. Mosby Company, 1938.

BOOK REVIEWS

Annual Reprint of the Reports of the Council on Pharmacy and Chemistry of the American Medical Association for 1937, with the Comments That Have Appeared in *The Journal*. Cloth. Price, $1. Pp. 201. Chicago: American Medical Association.

This book is a great deal more than a mere record of the negative actions of the Council on Pharmacy and Chemistry. It gives in full the reasons for the Council's rejection

Are You Sure?

In some cases you probably prescribe two to three teaspoons of cod liver oil daily as an antirachitic for infants six months of age or older. . . . But **are you sure** that the baby actually receives the cod liver oil? Do you not find that all too often the mother neglects this daily task, or the baby refuses to take the dosage?

In prescribing Special Morning Milk you are assured that when the full tall can (13 fluid ounces) is included in the twenty-four hour formula (and this usually is the case for infants six months of age and older) the baby is receiving at least 1¼ teaspoons of cod liver oil equivalent in Vitamin D. The "daily battle" of forcing cod liver oil upon the child is eliminated. Furthermore, Special Morning Milk is available at all leading retail grocers at no extra cost over other evaporated milks having a lesser amount of added vitamin D.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA AUTHORIZED BY THE AMERICAN MEDICAL ASSOCIATION TO MAKE THE CLAIM THAT THE AMOUNT OF VITAMIN D ADDED IS GREATER THAN THAT USUALLY REQUIRED FOR THE PREVENTION OF RICKETS IN NORMAL INFANTS AND THUS THAT A MARGIN OF SAFETY IS OFFERED WHEN TAKEN IN THE QUANTITIES CUSTOMARILY PRESCRIBED BY THE PHYSICIAN.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA USING COD LIVER OIL CONCENTRATE AS ITS SOURCE OF VITAMIN D.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA CONTAINING 400 U.S.P. UNITS OF ADDED VITAMIN D PER TALL (13 fluid ounces) CAN OR ANY ADDED VITAMIN A. (2000 U.S.P. UNITS VITAMIN A ADDED TO EACH TALL CAN.)

No Cod Liver Oil taste in the Milk!

BOOK REVIEWS

(Continued from Page 13)

of various preparations, but it also records results of the Council's investigations of new medicinal agents not yet out of the experimental stage, and frequently contains reports on general questions concerned with the advance of rational drug therapy. All three categories of reports are represented in the present volume.

This issue of the Reports is remarkable for the series of valuable status and preliminary reports published by the Council in the past year. These include the reports on avertin with amylene hydrate (now accepted for New and Nonofficial Remedies), benzedrin sulfate (the active constituent of the notorious "pep" pills, but a promising drug when its limitations are recognized), catgut sutures (a survey of the sterility of the market supply), evipal soluble (a comprehensive review of the evidence for the usefulness and limitations of the drug), histidin hydrochlorid (a study of the usefulness of the drug in peptic ulcer, to be considered in connection with the report rejecting larostidin, a proprietary brand, for unwarranted and exaggerated claims), mandelic acid (an authoritative statement of the limitations of this drug which the Council has now accepted), and vinethene (a careful study of the evidence for the drug, which the Council has accepted for one year as an anesthetic to be used in short procedures).

Other notable reports of outright rejection of products are those on Causalin (Causyth), an unsafe and dangerous preparation proposed for use in arthritis; Glutamic Acid Hydrochlorid (Calco), proposed as a conveyor of hydrochloric acid, with unsubstantiated claims of clinical effectiveness; Larodon "Roche," proposed as a substitute for other well-established analgesic and antipyretic drugs and marketed with exaggerated and unwarranted claims.

Two reports on sulfanilamid appear, a nomenclature and status report, together with reprints of *The Journal* editorials, giving the warnings which, if obeyed, would have avoided the series of deaths which resulted from the marketing of the ill-fated Elixir of Sulfanilamid (Massengill).

At the end of this volume appears an eulogy of George Henry Simmons, whose death deprived the Council on Pharmacy and Chemistry of its founder and American medicine of a worthy and faithful servant.

New and Nonofficial Remedies, 1938. Containing Descriptions of the Articles Which Stand Accepted by the Council on Pharmacy and Chemistry of the American Medical Association on January 1, 1938. Cloth. Price, $1.50. Pp. 592. Vol. 66. Chicago: American Medical Association, 1938.

In this book the Council on Pharmacy and Chemistry lists and describes the medicinal preparations that it has found acceptable for general use by the medical profession. A glance at the list of the Council members and the long list of consultants appearing in the first part of the book gives ample warrant for the authority of the Council's selections.

New substances described in this volume are sulfanilamid and protamin zinc insulin, with the accepted brands. The proved value of these new additions to the physician's armamentarium bids fair to make the past year a milestone in therapeutic progress. The Council is to be congratulated on the promptness with which it evaluated these drugs and established standards for their adequate control. From the first the Council warned against using sulfanilamid in untried combinations. The sad tragedy of the deaths from the rashly introduced Elixir of Sulfanilamid (Massengill) starkly emphasizes the value of such a body as the Council to the medical profession and the pharmaceutical manufacturers as well as to the public. Of course this potential value cannot become effective as long as those concerned refuse to follow the Council in the use of new remedies.

Other noteworthy new drugs which appear in New and Nonofficial Remedies, 1938, are avertin with amylene hydrate, vinethene, pontocain hydrochlorid, basal, general and local anesthetics, respectively; novatropin and syntropan, synthetic mydriatics.

Physicians who wish to know why a given proprietary is not described in New and Nonofficial Remedies will find the "Bibliographical Index to Proprietary and Unofficial Articles Not Included in New and Nonofficial Remedies" of much value. In this section (in the back of the book) are given references to published articles dealing with preparations that have not been accepted. These include references to the Reports of the Council, to Reports of the American Medical Association Chemical Laboratory, and to articles that have appeared in *The Journal.*

AMNESIA

Convenientia Patientis

DIAGNOSIS: Loss of memory, usually following purchase of goods or professional services.

SYMPTOMS: Avoids the creditor; moves, leaving no forwarding address; ignores bills, statements and letters; or discovers treatment was unnecessary, or ineffective, or both; charges excessive, as neighbor got more for less from another; can't afford to pay, as must pay chiropractor who cured, and paying on new automobile.

PROGNOSIS: Usually curable in early stages; if neglected, is progressive and becomes chronic and incurable.

℞ **PRESCRIPTION:** Refer promptly when ailment discovered to competent collection specialist (Cramer Collection Service).

TREATMENT: (Administered by the C. C. S.): Tactful approach; courteous, but firm and effective argument; increase and repeat for satisfactory result.

RESULT: Complete return to mental normalcy; greatly relieved conscience; restored high regard for creditor as indicated and recommendation to all acquaintances, and prompt payment for all further services.

DISCUSSION: (By the C. C. S.): Unnecessary and unwise delay in proper use of suggested prescription results in **rigor mortis** of the bill.

TWENTY-FIVE YEARS AGO

(Continued from Text Page 104)

$50,000 a year at present. None of the income is to be used for building purposes. . . .

From an Article on "Evolution in the Study of the Heart: A Survey" by Harry I. Wiehl, M. D., San Francisco.—Privilege indeed it is to live in a renaissance period. When we stop to consider how for centuries medicine has stood ineffectual in the face of the morbid heart, groping here and there for light in the midst of darkest ignorance and unable to attain any efficiency in this field, it is a great satisfaction to know that our own times have finally opened up new paths to knowledge and treatment of chronic heart disease. . . .

From an Article on "Stereoroentgenography in Pulmonary Tuberculosis": A Clinical and Anatomical Study by Walter W. Boardman, M. D., San Francisco.—The question of the value of radiographic examination in the diagnosis of pulmonary tuberculosis is one which has called forth widely varying opinions. To investigate this question a complete stereoroentgenographic apparatus was installed in the Phipps Dispensary of the Johns Hopkins Hospital, and arrangements made for the study of a large series of cases, the radiographic findings being checked by careful clinical and, when possible, by autopsy examination, the work being carried on by Doctors Dunham, Wolman, and myself. . . .

From an Article on "Two Cases of Cerebellar Disease Followed by Autopsy" by Walter F. Schaller, M. D., San Francisco.—I wish to present the history of two cases of cerebellar disease, both of which came to autopsy. They represent two different types in their symptomatology: one was of sudden onset with no tendency toward a progressive course and with no evidence of intracranial pressure, while the other came on slowly and progressively with marked signs of intracranial pressure. In these two cases I wish to lay special stress on the analysis of the character of the ataxia. . . .

From an Article on "Factors in the Physiology of Bone in Relation to Surgery" by Arthur L. Fisher, M. D., San Francisco.—My reason for presenting this paper at this time, is that it seemed to me, from the discussions following Doctor Sherman's paper at the last meeting of this section, that there was not a very definite understanding among those who are operating on bone as to what happens or may happen after the operation. . . .

From an Article "On the Differential Diagnosis of Appendicitis and Nephrolithiasis" by M. Krotoszyner, M. D., San Francisco.—Attempts to recognize and remove concrements of the upper urinary tract date back to the dawn of medical history at the times of Hippocrates, when perforated calculi were extracted or paranephritic abscesses were successfully emptied by incision. The treatment of nephrolithiasis, of course, became a rational and scientific procedure only since Simon, in 1871, paved the surgical road to exposure of the kidney. . . .

From an Article on "The Skin Reaction After Cowpox Vaccination: A Possible Aid in Public Health Administration" by John Nivison Force, M. D., Berkeley.—During the course of an antivaccination meeting held in Berkeley recently, the principal speaker of the evening issued a challenge for any person present to define successful vaccination.

The antivaccinationist, firm in the conviction that the medical profession still holds unchanged the hypothesis of

(Continued on Page 18)

BASIC OPERATIONS IN COMMERCIAL CANNING PROCEDURES

V. HEAT PROCESSING THE SEALED CONTAINER

● Previously, we have described how raw food material is sealed in the tin container after proper preparatory treatment. After sealing, the next important step in commercial canning is the heat process, or "process" as it is called in the industry.

Essentially, the processing operation involves exposure of the sealed container to hot or boiling water, or to steam under pressure, for the correct period of time. The purpose of the process is to destroy pathogenic or spoilage organisms which may be present on raw food material; the seal on the can then prevents re-infection of the foods by such organisms. Thus, the sealing and processing operations combine to insure a sound, wholesome canned product.

It is not possible here to review all factors which must be considered in the establishment of an adequate heat process for any specific product. Such factors have been briefly discussed in recent publications (1, 2). It must suffice to state that, in general, commercial processing operations are divided into two general types, depending upon the acidity of the food being canned.

The "acid" foods—including the common fruits and certain vegetables or vegetable products whose pH values fall below 4.5—are quite easily heat processed. With such foods it is only necessary to heat the sealed container long enough to permit the attainment of a definite temperature in the center of the can (usually 200°F. or slightly less). In fact, some acid products may be processed by filling sufficiently hot, sealing and inverting the cans, and cooling without further process.

The "non-acid" foods—such as meat, sea foods, milk and most of the common vegetables—require temperatures above that of boiling water for adequate heat processing. Such foods are processed under steam pressure in a closed "retort", usually at a temperature of 240°F. Years of research have made possible the issuance for the guidance of modern canners of a bulletin listing recommended process schedules for the non-acid products (3).

Regardless of the temperature of processing, equipment is available which permits use of the batch or "still" process, and the "continuous" or "agitating" types of process for sealed cans. Improvements in processing machinery and accessory instruments during the past two decades permit precise, scientific control of commercial processing operations.

Above all, however, the modern canner has a clear understanding of the underlying purpose of the process and a deep appreciation of the necessity for strict supervision of the processing operation. Commercially canned foods, consequently, must be ranked today among the most wholesome foods coming to the American table.

Jener, must of necessity find many weak points in the definition laid down in the present vaccination act. . . .

From "No Medical Schools."—The whole purpose of modern medical requirements is simply to demand that those who wish to practice the healing art shall be sufficiently trained in the fundamental sciences. Homeopaths are so trained and the graduates of their schools are able to pass an examination on these sciences. There is nothing in the Medical Practice Act to interfere with an educated man of the homeopathic or any other school. The incidental fact that when physicians are educated they practice all very much the same sort of medicine, and that the schools disappear, is not the fault of the law, and is not regarded by any educated man as a fault.—*Fresno Republican.*

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 104)

"Operation of an alleged 'medical clinic' swindle in which physicians, business men, lawyers and Hollywood writers were victimized, was disclosed today by Deputy District Attorney J. Miller Leavy. Leavy made the disclosures as he issued complaints of forgery and petty theft against James E. Walsh, thirty-five, a salesman, who gave his address as 2307 Vacanta Way. In the forgery complaint Walsh is accused of forging the name of Howard Hughes, film producer and record speed flier, to a check for $3,881 that Walsh reportedly used in assertedly obtaining money. Leavy stated that Walsh, by telling physicians Hughes wanted them to head the clinic, obtained various sums of money. It is charged he received $60 from Dr. W. Dooley, 609 South Grand Avenue; $35 from Dr. B. E. Grant, 6777 Hollywood Boulevard, and $10 from Dr. T. N. O'Neil of 1930 Wilshire Boulevard. He also is charged with getting $35 from T. P. Fithian, a writer. . . ." (Los Angeles *Herald-Express,* May 16, 1938.)

"Dr. Carlos Thomaine, formerly of San Bernardino, was under arrest in Riverside yesterday on a charge of having illegally accepted nearly $800 relief money as an unemployable indigent." (San Bernardino *Sun,* May 18, 1938.) No one by the name of Dr. Carlos Thomaine appears in the records of the Board of Medical Examiners nor is his name listed in the 1936 American Medical Association directory.

"For lack of sufficient evidence, the case against Inez Brown and Margie Silver, charged with performing abortions, was dismissed today by Municipal Judge Theresa Meikle. The women had been arrested and held on $500 bail after police raided a place at 327 Fillmore Street and reported they found nine women there, besides the Brown and Silver women. Two of the women, the officers testified, admitted they were there for illegal operations, but they gave false addresses and could not be found to testify in court. All other evidence, Judge Meikle ruled, was hearsay." (San Francisco *Call-Bulletin,* May 31, 1938.) (Previous entry, June, 1938.)

"Laura M. Bedwell, drugless practitioner, was arrested in her offices at Oceanside yesterday on a charge that she had performed an illegal operation on Shirley Hanf last February 17. Formal complaint was made after the young woman and friends had provided the district attorney's office with statements and considerable documentary evidence, it was stated." (San Diego *Union,* May 17, 1938.) The records of the Board of Medical Examiners do not show L. M. Bedwell as the holder of a Drugless Practitioner license.

Insure Your Health With the Sun

Smart men and women realize that good health is a blessing not to be taken for granted, know that an occasional week or two under a friendly sun at debonair Del Monte is the best health insurance of all. The premiums are modest, the returns many. Wander as you will over this 20,000 acre playground. Play four championship golf courses (including Pebble Beach!) ... discover the quiet beauty of bridle-pathed, pine-scented forests... explore sea-sprayed rocks that front the Western shore ... wander Spanish Monterey's storied streets. Play hard or loaf long.

"Arthur Carl Erikson, thirty-six, came to his death in an automobile 'accident due to negligence on the part of Dr. Harvey Smith.' That verdict of a coroner's jury was entered into the records of the coroner's office today following an inquest yesterday afternoon in Pasadena. Doctor Smith, a Hollywood physician and resident of the Flintridge district, is at liberty under $1,000 bail for appearance in court tomorrow morning to plead to a charge of driving while intoxicated and being involved in an accident resulting in injury. . . . Erikson was fatally injured in an automobile crash on Sunday morning at Russell and Chevy Chase. The coroner's jury recommended that the driving license of Doctor Smith, who police said was on probation in a prior drunk-driving conviction, be revoked." (Glendale *News-Press,* May 25, 1938.)

"The board of directors of the Ahwahnee Sanitarium on Saturday removed Dr. Robert E. (V.) Baker as medical director of the institution because he was not satisfactory to the directors. . . . Doctor Baker, formerly attached to the staff of the Olive View Sanitarium at Los Angeles, was named medical director in February to succeed Dr. John Weber, who was relieved of the post at that time. . . ." (Mariposa *Miner,* May 19, 1938.) (Previous entries, August and November, 1934; August, 1935; December, 1936; February, March, and July, 1937.)

"Denied a new trial after conviction on conspiracy to defraud and grand theft charges, Dr. E. H. Anthony was sentenced to San Quentin prison yesterday. Superior Judge Charles W. Fricke granted Doctor Anthony a new trial, however, on his conviction of two charges of solicitation of the commission of a crime, but these counts were taken off the calendar pending appeal. Under the sentence given yesterday, Doctor Anthony faces one to ten years in prison. Judge Fricke ordered the terms to run concurrently." (Los Angeles *Examiner,* May 27, 1937.) (Previous entries, January, 1935; February and March, 1937; April, 1938.)

"Dr. Romney M. Ritchey, psychiatrist, today succeeded Dr. George Hess as chief of the medical staff on Alcatraz Island, it was announced, following Hess' transfer to the new federal prison on Terminal Island near Los Angeles. . . . Doctor Ritchey has served in the United States public health service and the federal penitentiary at McNeil's Island." (Oakland *Post-Enquirer,* June 3, 1938.)

"New Dealers are getting ready for high combat with the organized medical profession on health insurance. The fight already has broken out in the capital, where the Home Owners' Loan Corporation is operating a group health insurance plan for federal employees. But the social welfare group in the administration expects the local fight to size up as just a preliminary skirmish after a national health insurance plan is proposed. . . . Dr. Isidor S. Falk, a member of the Social Security Board's research staff, is studying the national health problem with a view to helping the Board decide whether it should recommend health insurance legislation. . . . The HOLC plan, under fire from both the American Medical Association and the District of Columbia Medical Society, provides one of the simplest types of health insurance. . . . The legality of the HOLC plan now is being tested in the courts. New Dealers point to the Capper health insurance bill, pending in the Senate, as a hint to the form a federal program might take. Drafted by Abraham Epstein, head of the American Association for Social Security, the Capper Bill would provide not only medical care for the sick, but also cash benefits for those out of work because of sickness." (Press dispatch dated Washington, May 31, and printed in the San Jose *Mercury-Herald,* June 1, 1938.)

"Not only must a doctor pass an examination before he can practice medicine; he must continue to maintain a high professional standard or his license will be taken away from him. Dr. (Russell) Craft was a medical examiner

Helium-Oxygen Mixtures Used in Treatment of Asthma

The general effect of a mixture of helium with oxygen (usually 80% helium, 20% oxygen) is to increase the permeability of the gas, enabling it to pass through the alveoli and relieve congestion. Helium-Oxygen also has a tendency to reëstablish sensitivity to epinephrine.

We are furnishing these mixtures of Helium and Oxygen, prepared with our customary exacting care; and also the proper equipment to use them. For clinical data and other information, address us at 211 Bay Street, San Francisco.

for the United States Veterans' Bureau. He was convicted of the crime of presenting for payment false, fictitious and fraudulent claims with the intent to cheat the United States Government, and was sentenced to prison for a year and a day. Because of his conviction of this felony the state of Idaho revoked his license as a physician. . . ." (Santa Cruz *Sentinel*, June 1, 1938.) (Previous entry, December, 1932; July and November, 1935.)

Men of Medicine: 1938.—How can all the nation receive adequate medical care; doctors adequate pay?

This problem, which has. in the last year, precipitated a controversy between medical men and made headline news of coöperative medicine, group practice, group hospitalization and "socialized" medicine as remedial measures is treated in "Men of Medicine: 1938," to which March of Time this month devotes its entire issue.

"Men of Medicine: 1938" is a film narrative on medical science's campaign to eradicate the scourges which still take an inestimable toll yearly. It explains in detail the revolutionization of medical practice by the discovery and utilization of anesthesia, aseptic surgery, bacteriology and radiography, and demonstrates the benefits of surgery by recording on film the detailed preparation for an operation and its actual execution.

Also shown in the film are the advances of preventive medicine and the perfection of medical equipment, which modern medicine has at its command today. The utilization of vaccines, antitoxins, adrenalin, thyroxin, pituitrin, and insulin are recorded; and the purpose of the basal metabolism machine, the hydrotherapeutic bath, the artificial fever machine, the iron lung, are shown on the screen as an actual and living record of medicine's fight to ease suffering and prolong human life.

Against a background of these advancements of medical science, the film studies the nation's health problem. Dr. Thomas Parran, Jr., Surgeon-General of the United States, puts the problem succinctly in the film: "Our first need is to join in a nation-wide effort against those causes of disease and death for which we have scientific weapons of unquestioned power. Syphilis, tuberculosis, cancer, pneumonia, and maternal and infant mortality are examples. To help doctors who are fighting against tremendous odds in remote rural areas we need five hundred new hospitals. The underprivileged third of our population when seriously ill needs help from tax funds."

The American Medical Association, the United States Public Health Service coöperated in the making of "Men of Medicine: 1938." March of Time also had the help and advice of individuals and groups in the medical profession. Its characters are actual doctors and their patients, and it brings to the screen for the first time a record of actual work in surgery and general practice.

Last year, March of Time produced two eight-minute medical studies: "Conquering Cancer," for which it received the Clement Cleveland Award for "carrying the most poignant message of cancer control to the largest number of people," and "The Human Heart," treating newly discovered causes of heart disease and science's advancement in its control. "Men of Medicine: 1938" is its first full twenty-minute film discussion of a great medical and social problem.

Physicians must have preparations the ingredients and efficacy of which are of unquestioned value. The steady growth of The Smith-Dorsey Company from 1908 is the best indication that our products measure up to these requirements.

PHARMACEUTICALS
YOU CAN PRESCRIBE WITH CONFIDENCE

Every Smith-Dorsey product is safeguarded in three ways:

1. We operate a control laboratory for the purpose of testing raw materials for purity.
2. Finished products are thoroughly tested for conformity to label statements.
3. No new products are released without subjecting them to physiological tests.

Our laboratory is modern and complete and is manned by competent university trained chemists. No expense is spared to make research complete. No preparations are ever offered the laity.

Such is the background of Smith-Dorsey products.

THE SMITH-DORSEY COMPANY, LINCOLN, NEBRASKA

When the health of the people made a question of public and not of party policy, only a skilled expert could possibly be appointed as a public health officer, not as is now so often the case, the man with the political pull.—Sir William Osler.

It has been meanly said that the medical fraternity is sadly harassed by a generation of Americans who demand in pills, potions, and a variety of concoctions what its progenitors found in the plow-handle and the axe.

Allergy Diets

JUST THE WAY YOU WANT THEM

Here's help that you've wanted for your patients and for yourself. Safe, accurate allergy diets printed on individual sheets and supplied to you in pad form. They're easy for the patient to follow—easy for you to use. All you need do is fill in your patient's name, your name and special instructions.

Prepared with the cooperation of leading specialists, these sheets list exactly what foods may be eaten and which must be avoided according to the patient's special sensitivity. Recipes are provided on the back. No advertising appears on them.

Naturally Ry-Krisp is included among the allowed foods—for these crunchy, wholesome wafers, so simply made of whole rye, salt and water, are both safe and delicious. In fact, they actually encourage the patient to adhere more closely to the necessary diet—because they taste so good with other foods at every meal.

For copies of these sheets and samples of Ry-Krisp Whole Rye Wafers, simply use the coupon.

Rabies in Humans: Report on Six California Cases in 1937 and 1938.—The following are condensed case histories of attacks of rabies as reported to the California State Department of Public Health:

S. C., male, age 57 years. Occupation: Painter, Los Angeles City.

Bitten on April 26, 1937, by a stray dog while walking along the street to work. Left hand badly lacerated. Wounds were cauterized with nitric acid at a receiving hospital within one hour after having been bitten. Dog was killed and laboratory examination established the diagnosis of rabies. Antirabic treatment started on April 27. Treatments (fourteen doses) completed on May 13. Consulted physician on June 11, complaining of neuritis of left arm of three days' duration. Attended clinic on June 13 for neuritis. Called physician on June 15. Admitted to hospital on June 16. Patient died on June 18 at 8 a. m. Autopsy was performed and brain tissue inoculated into a rabbit on June 23. The rabbit died on July 15, and Negri bodies were found in the brain tissue.

* * *

Dr. S. C., male, age 58 years. Occupation: Veterinary surgeon, Altadena.

Examined a dog on July 19, 1937, thought to be suffering from arsenic poisoning, and while administering medicine he was bitten on the thumb of one hand. Later in the day treatment was again administered and the veterinarian was severely bitten on the other thumb. Both thumbs had been bitten by the same dog on the same day, and both bites involved puncture wounds through the thumb nails. Iodin was applied in the afternoon of July 19. The wounds were cauterized with nitric acid on July 20. Thumb nails not removed. The dog died on July 20, and laboratory examination established the diagnosis of rabies. Antirabic treatments were started on July 20. Treatments (fourteen doses) completed. Numbness and tingling of right hand developed on October 11. Admitted to hospital on October 14. The patient died on October 18. Autopsy on October 19 and smears of brain tissue revealed presence of Negri bodies.

R. H., male, age 28 years. Occupation: Mail carrier, San Gabriel.

Bitten by a stray dog on the lower leg above the ankle some time between October 21 and 27, 1937. Iodin was applied, and little thought was given to the incident. Nothing further known about the dog. Antirabic treatment not received by the patient. Numbness and pain developed in hands, arms, feet, and legs on November 26. Admitted to hospital on December 2. The patient died on December 3. Autopsy, December 3—Brain tissue shipped to State Bacteriological Laboratory and to the Hooper Foundation. Tissue inoculated into mice on December 6 produced rabies in eleven days at both laboratories, confirmed by finding Negri bodies in the brain.

* * *

S. H. W., male, age 57 years. Occupation: Laborer, Los Angeles City.

Bitten, approximately, on February 27, 1938, on the second finger of the right hand. The history is vague, as no importance was apparently attached to the incident. No cautery and no antirabic treatment. A known rabid spaniel was known to have been at large in the neighborhood where this man was bitten. Onset of symptoms, March 10. The patient died on March 12. Negri bodies found in the brain.

* * *

R. B., male, age 50 years. Occupation: Canvasser, Los Angeles City.

Badly bitten on the lower lip about six weeks prior to onset. While under the influence of liquor he had stopped to pet a sick dog. Nothing further known of the dog. No cautery and no antirabic treatment. Onset of symptoms, March 15. The patient died on March 25. Negri bodies found in the brain.

* * *

A. S., male, age 39 years. Occupation: Dairyman, near Lemoore, Kings County.

On March 17, 1938, the patient attempted to treat a sick cow and put his hand down into the animal's mouth, grab-

bing the tongue. In doing so he abraded the knuckles of his hand on the cow's teeth. The cow died, and the brain was reported positive for rabies by the State Laboratory. No cautery, but antirabic treatment was started on March 19 and completed on March 30. Onset of symptoms, March 29—the day before he received his last antirabic treatment. The patient died on April 3.

This was the paralytic type of rabies, and the report of rabies from the pathologist was the basis of diagnosis. The attending physicians stated that, clinically, the case appeared to be poliomyelitis.

What Midwestern Small City Families Spend for Medical Care.—Midwestern small city families are more likely to economize by not seeing the dentist, the oculist—or even the doctor—than by not buying supplies for the family medicine chest when funds run low. This tendency is indicated in a table of medical expenditures for 3,118 native white nonrelief families living in seven representative cities in five Middle Western States. The table is a part of a nation-wide study of how much money the American family makes and how it is spent, conducted under the direction of Dr. Louise Stanley, Chief of the Bureau of Home Economics. The cities studied were Lincoln, Illinois; Boone, Iowa; Columbia and Moberly, Missouri; Mount Vernon and New Philadelphia, Ohio; and Beaver Dam, Wisconsin.

Low-income families consult dentists less frequently than doctors, and visits to the oculist usually are omitted entirely. But a majority of families at all income levels (67 to 92 per cent) reported expenditures for medicines and drugs during the twelve-month period studied in 1935–1936. Amounts spent for medicine, however, were not high, averaging $6 to $21 per family per year at the different income levels. Averages were based on all families, including those that made no purchases for the medicine chest.

Income for the year reached the $500 level before as many as half the families reported expenditures for a physician. Incomes of nearly three times this amount ($1,250 to $1,499) were reached before as many as half the families had any expense for the dentist during the year. Even at the $4,000 to $4,999 level only one family in four paid an oculist fee.

Fewer than 40 per cent of the families in the lowest income class studied ($250 to $499) spent money for doctors' fees during the year; fewer than 12 per cent spent for dentists' services; and none of these families incurred any expense at all for an oculist. However, 67 per cent bought some medicine.

Approximately half the families in the second lowest income class studied ($500 to $750) had expense for the physician; one in four, for the dentist; and practically none—less than half of one per cent—for the oculist. Three families out of every four bought some medicine-chest supplies.

Nearly all families of income levels above $500 (90 to 99 per cent) had some expenditure for medical care during the year. But even at the highest income level studied ($5,000 to $10,000) only three families in four reported expense for a physician; four families in five reported expense for a dentist; and fewer than one in four for an oculist.

"It is evident that a majority of families with very low incomes did not have periodic physical examinations by a doctor and did not have the condition of their teeth checked regularly by a dentist," says Doctor Stanley. "Average amounts spent for medical care in low income groups were not sufficient to pay for such routine services for all family members, even if the costs of serious illnesses had not been added in many instances. Since it is likely that families with low incomes need even more medical care than those that are well-to-do, these figures seem to indicate inadequate health measures. They support the contention of many social workers and others, that society should help provide adequate medical care for those who cannot pay the cost."

A comparatively small number of families ranging from 5 per cent in the lowest income class to 24 per cent in the highest, incurred bills for hospitalization. Although the percentage of families having such expenses increased with

(Continued from Preceding Page)

income, families with the very least to spend were not exempt. Expenditures for hospitalization ranged from an average of $3 per family in one of the lowest income classes to $21 in the next to highest. The number of families that paid health and accident insurance premiums was approximately twice as large as the number that paid hospital bills.

In one income class, $2,250 to $2,499, almost half (47 per cent) of the families paid on health and accident policies. The percentage of families making such payments ranged from 12 in the lowest class to 44 in the highest. These premiums took an average of $2 per family in the lowest income class studied ($250 to $500), and $27 in the highest. Averages were based on all families, whether or not they had any expenditures.

Wide differences in average amounts spent for medical care at the different income levels are noted. Families receiving between $250 and $500 spent an average of $28 for the year—a little more than $2 a month—while those with incomes of $5,000 to $10,000 reported expenditures averaging $184—a little more than $15 a month. Expenditures were averaged for all families.

Average amounts paid to the oculist ranged from less than fifty cents for the income bracket $750 to $999, to $4 per family for the year in two of the higher brackets. Not until incomes were $2,500 did the average amount spent per family for the year exceed $1. Families in the $250 to $499 income class had no expense for an oculist's services.

A few illustrations of family medical care spending at various income levels follow:

Of the families studied, 467 had incomes between $1,000 and $1,250. This income group averaged spending $47 during the year for medical care, apportioned as follows: physician, $14; dentist, $6; oculist, $1; medicine and drugs, $6; hospitalization, $5; health and accident insurance premiums, $6; and all other items including other specialists, clinic visits, nursing service, etc., $9.

In the income band $2,000 to $2,249, 215 families coöperated in the study. They spent an average of $77 for medical care, classified as follows: physician, $20; dentist, $11; oculist, $1; medicine and drugs, $8; hospitalization, $8; health and accident insurance, $16; and other items, $13.

Two hundred and one families with incomes between $3,000 and $4,000 reported expenditures averaging $114 for medical care—$23 for the physician; $20 for the dentist; $2 for the oculist; $14 for drugs and medicines; $17 for hospitalization; $21 for health and accident insurance; and $17 for other items.

Families with incomes between $5,000 and $10,000 reported expenditures averaging $184 during the year, divided as follows: $32 to the physician; $26 to the dentist; $3 to the oculist; $21 to the druggist; $15 to the hospital; $27 to the health and accident insurance company; and $60 for the other items.

Only expenditures of nonrelief white families that included husband and wife, both born in this country, were analyzed for this report from the Study of Consumer Purchases, a Works Progress Administration project, conducted by the Bureau of Home Economics of the United States Department of Agriculture in coöperation with the Bureau of Labor Statistics of the United States Department of Labor, the National Resources Committee, and the Central Statistical Board.

Child Hygiene Distributes New Films.—The following new 16-millimeter silent films are available through the Bureau of Child Hygiene, 305 State Building, San Francisco. The only cost is that of return transportation. Requests for this loan service should be filed two weeks in advance.

The Feet—One-reel film.

Shows details of structure and arrangement of the arches; the best mechanical use of the foot; the points of a good shoe, and harmful effect of improper shoes; good feet as an asset.

Food and Growth—One-reel film.

A feeding experiment with white rats, actually carried on in a classroom, demonstrates the food value of milk as compared with coffee and candy. The system of feeding, cleaning of cages, and charting of growth records are given in detail.

Posture—One-reel film.

Good posture, both standing and sitting; the part played by the muscles in determining whether it shall be good or bad; how to correct poor posture; and the importance of good posture in physical well-being.

Teeth—How Teeth Grow—One-reel film.

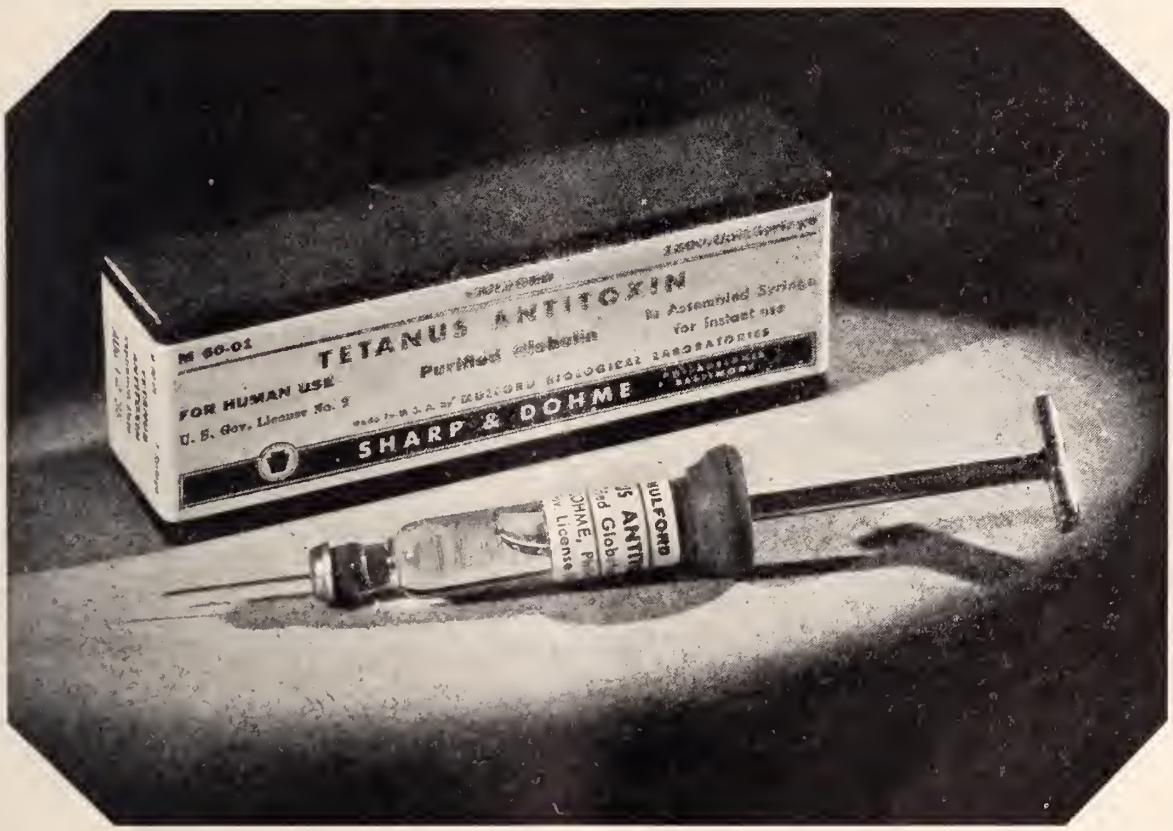
The order of formation and eruption of the temporary and permanent teeth is demonstrated by animation, models, and subjects of various ages.

Around the Clock with Your Baby and You—Three-reel film.

Shows the care of a young baby. Four-hour schedule indicated by clock. Technique of breast feeding, with care of the nipples; manual expression of milk; the baby's bath; sunbathing; outdoor sleeping. Mother's rest period during the day and period of health supervision by the doctor. The third reel shows preparation of the formula with both fresh and canned milk. Care of nipples, bottles, etc.

From Morning Until Night—Two-reel film.

Depicts care of a six-month-old baby, featuring a table-bath, preparation of pureed vegetables, feeding, training, play, sunbath, sleep, and routine health examination by the family physician.



Prenatal Care—One-reel film.

The Road to Health and Happiness—One-reel film.

General child hygiene film, with emphasis on dental care. Diet, rest, sunshine, and mental hygiene through family activities.

There is a budget which we pay with frightful regularity; it is that of unnecessary disease and premature death.—Irving Fisher.

Emergency treatment of wounds for the prevention of Tetanus

ACCEPTED AMERICAN MEDICAL ASSN Council on Pharmacy and Chemistry

TETANUS Antitoxin Purified Globulin, Mulford, is a highly concentrated, purified and standardized tetanus antitoxin. Because of its small volume and low protein content, it is well suited for the emergency treatment of contused, lacerated and puncture wounds. It is easily injected, is rapidly absorbed and produces almost immediate protection. The small volume and low protein content also reduce the incidence of local and systemic reactions.

For ordinary wounds, the immediate administration of 1,500 units of Tetanus Antitoxin Purified Globulin, Mulford, is suggested. In wounds with severe trauma, necrotic tissue or foreign bodies present, twice the usual prophylactic dose of either Tetanus Antitoxin Purified Globulin, Mulford, or Tetanus Gas-Gangrene Antitoxin Mixed, Mulford, should be given. A second dose may be administered within four or five days.

Tetanus Antitoxin Purified Globulin, Mulford, is supplied in syringes or vials of 1,500 and 5,000 units; in syringes of 10,000 and 20,000 units. Tetanus Gas-Gangrene Antitoxin Mixed, Mulford, is supplied in syringes or ampoule-vials containing 1,500 units Tetanus Antitoxin, 2,000 units Perfringens Antitoxin, 2,000 units Vibrion Septique Antitoxin.

BALTIMORE, MARYLAND

The Doctor's Puritanical State of Mind.—Many years ago Osler, speaking to the Medical Society of London, said: "But I see an incredulous look on some faces and I hear the whispered comment, ''tis heard often enough! 'Where is all this syphilis? It does not come my way!' Yes, it does. The syphilis we see but do not recognize everywhere awaits diagnosis, so protean are its manifestations."

"Too many doctors still believe that nobody has syphilis except negroes, prostitutes, and criminals. Their own patients, failing to fall into one of these classes, are too well born, too moral, too well educated, too well-to-do to be infected. Too many doctors, surprising as it seems, still think of syphilis as a disgrace, not as a disease, and hesitate to suggest the necessary steps for diagnosis lest the patient's feelings be wounded. Too many, even if they do recognize syphilis, still think of it as well-earned punishment for sin, and do less than their part in administering or arranging for proper treatment.

"Such statements as '10 per cent of the adult population is infected' fall on uncomprehending ears, and are as difficult to interpret in terms of personal experience as the billions of the national debt. Even if the facts of 500,000 fresh infections each year and a total of some 10,000,000 syphilitic adults in the country are accepted, there is no appreciation of the fact that all social classes, not only the lowest, are to some extent involved.

"These two reasons combine to produce in the minds of many physicians what Stokes so neatly calls 'a low index of suspicion.' The possibility of syphilis is dismissed as incredible. That syphilis can occur in the clientele of the family doctor who has known his patients for a lifetime, is beyond belief. It is, likewise, incredible that the specialist's patients, well educated and relatively well-to-do, can be infected with a disease which he believes to be limited to social groups with which he does not deal.

"The medical profession's attitude of mind must be remedied before case-finding in syphilis is adequately successful."—Moore.

Without health, life is no life.—Rabelais.

THE POTTENGER SANATORIUM AND CLINIC, Monrovia, California

United States Pure Food Authorities Report on Campaign to Rid Market of Unclean Stocks.—Drug products recently seized were 38 dozen bottles of aromatic spirits of ammonia, 24 dozen bottles of sweet spirits of nitre, 5 lots (in bulk and capsules) of sandalwood oil, 1,024 bottles of hydrogen peroxide, and 75 cans of anesthetic ether, all falling below the official standards; 75 bottles of short-volume milk of magnesia; 760 packages of unsterile absorbent cotton; 1,454 gross of defective mechanical prophylactics; 39 packages of a defective "French pessaire," carrying claims for the treatment of cancer in women; 21 bottles of "Vitawine," containing less vitamin B than its label claimed, and 2,200 bottles of "Waukesha Fox Head Mineral Water," found to be polluted.

The following patent medicines were seized because of false and fraudulent therapeutic claims in their labels: Apostol Herb Tea, Balsam for the Lungs, Boroseptol Tablets (not antiseptic as claimed, and offered for the treatment of catarrh, ulcers, eczema, and women's diseases), Hon. Prof. Dr. Jos. Herman's Special Blood Purifier, Kidney Tablets, Kobros Tablets, Dr. Ranoll's Indian Herb Tablets and Indian Black Tablets, Saxon Blackberry Cordial Compound (for diarrhea, cholera morbus, and other ailments), and Tree of Life Tonic (for diabetes, and diseases of the stomach, blood, liver, and kidneys).

Terminations of eighteen criminal prosecutions were reported to the Administration. The cases involving foods are as follows: Hydaburg Fisheries, Inc., Hydaburg, Alaska, partially decomposed canned salmon, fine $200 and costs; Rothenberg & Schneider Bros., Chicago, Illinois, "Emulsol M" (a frozen egg product), partially decomposed, fine $35 and costs; Dutch Baker Boy, Inc., and John W. Kauffman, Washington, D. C., chocolate eclairs contaminated with harmful bacteria, alternative of $200 fine or sixty days' jail sentence on Kauffman, suspended by the Court; Favro Macaroni Mfg. Co., Seattle, Washington, spaghetti represented as made from "100 per cent semolina" but in fact of flour, and artificially colored, fine $11 and costs.

Angelo Glorioso, New Orleans, Louisiana, insufficiently concentrated tomato puree, fine $600, of which $300 was suspended by the Court, and the defendant was placed on three years' probation; Archer Produce Company (Abram and Thomas Buckley Archer), Vinita, Oklahoma, fined $25; Harding Cream Company, Omaha, Nebraska, fined $40 and costs; A. B. Winkley Cheese Company, Seattle, Washington, fined $55, and Turner & Pease Co., Inc., Seattle, Washington, fined $65 and costs, for shipments of butter containing less than the legal minimum of butterfat.

Drug case terminations were: Rathbun Sales Corporation, El Paso, Texas, below-standard tincture of iodin, fine $50; Aimotone Chemical Company (A. G. Fagras and Sam Mavros), "Aimotone," falsely represented as a blood purifier and a treatment for sluggish liver, fine $155; Alberty Food Products, Hollywood, California, "Malto-De," misrepresented as to its phosphorus and vitamin D content, fine $150; Astyptodyne Chemical Company, Inc., Wilmington, North Carolina, "Astyptodyne Cough Syrup" for bronchitis, sore throat, whooping cough and croup, and "Astyptodyne Ointment" for piles, fine $25.

Koch Products Co., Winona, Minnesota, "Dr. Koch's" Stick Salve, Sept-O-Cide, Inhalo, Cold Tablets, Camph-O-Lin, Cough Syrup, Vegetable Tea Tablets, Dyspepsia Tablets, Mentho-Campho, and Liver Pills, all carrying unsubstantiable medicinal claims, plea of guilty entered by defendant, and sentence deferred for one year by the Court.

Marie Leiblinger & Co., Inc. (Marie Leiblinger and Theodore W. Nosek), Altadena, California, "Nonat," an ointment for blood poisoning, felons, rheumatism, sore kidneys, poison ivy, lung fever and other conditions, fine $4; and Mentho-Jell Company, Albert Lea, Minnesota, "Kalo's Headache Powders," "Kalo's Mentho-Jell," and "Kalo's Veterinary Salve," fines of $25 in each of two cases.

EVALUATION and comparison are the natural processes by which the physician selects his armamentarium. Lilly pharmaceuticals and biologicals are offered solely on their merits, and are supported by more than sixty years of research and pharmaceutical experience. The Lilly trademark stands today, as in the past, for co-operation with the medical profession in unprejudiced evaluation of therapeutic agents.

CARBARSONE

New cases of amebiasis and of amebic dysentery are likely to be discovered during summer months. Carbarsone provides effective treatment. This pentavalent arsenical is unusually safe to administer.

Carbarsone, Lilly, is supplied in Pulvules (filled capsules) and Tablets, for oral use, and in Substance for preparation of therapeutic enemas.

Carbarsone Suppositories are available for the treatment of trichomonas vaginalis vaginitis.

Official Letter from President W. W. Roblee

CALIFORNIA MEDICAL ASSOCIATION
Office of the President

Subject:

EXECUTIVE OFFICERS FOR THE COMING YEAR

To Members of the California Medical Association:

The Constitution of the California Medical Association provides in Article X, Section 11, and Article VII, Section 5-D, that the Council, at its organization meeting held after the last meeting of the House of Delegates, shall elect a secretary-treasurer and editor and an attorney, these officers to serve for the ensuing year.

The Council met on May 12 and, after prolonged deliberation, unanimously elected Dr. George H. Kress to the combined office of secretary-treasurer and editor, Mr. Hartley F. Peart as counsel, and Mr. Hubert T. Morrow as associate counsel. This action was reaffirmed at a special Council meeting held in San Francisco on June 11.

For quite some time some of the members of the Council have felt that, if a suitable man could be found, the offices of secretary-treasurer and editor should be combined. As a matter of fact, Doctor Warnshuis was placed on a month-to-month basis at the 1937 (Del Monte) organization meeting of the Council (as noted in the June, 1937, issue of the Official Journal), and a committee was appointed to secure a successor. Several men were approached with reference to the position. After prolonged consideration, both individually and collectively, the Council voted to invite Doctor Kress to fill the combined office, and he accepted the call. Of the twenty-one councilors there were but two absentees when the decision was made. Both Doctor Warnshuis and Doctor Kress have rendered splendid service to the Association, but it was the judgment of the Council that Doctor Kress could more nearly fulfill the requirements of the office. He has been actively engaged in Association and organized medical activities for many years. He is a past president of this Association, and has served on the Council and Executive Committee continuously since 1907, following the reorganization of the State Association in 1902. His service to public health through membership in the State Board of Public Health, to medical education through his office of Dean of the Los Angeles Medical Department of the University of California at Los Angeles, and other activities has been outstanding. His statewide contacts will be

invaluable to us. He will move to San Francisco and devote his entire time to Association work.

The Association is thus fortunate in being able to have Doctor Kress for its executive head. This statement is not in any sense to be construed as a criticism of Doctor Warnshuis. He has given us splendid service. The Council had the difficult task of deciding between two excellent men, and it was hardly to be expected that all members of the Association would be pleased with the decision.

We have an important year in prospect. Problems of socialized medicine and other phases of medical economics, insurance in its varied aspects, undergraduate and postgraduate education, the fall election and the session of the Legislature, all will present a challenge to the profession which can be met only by united, harmonious and vigorous action. Your leaders, both elective and appointive, can serve you with satisfaction only if they have the active support and coöperation of every member. Whatever difference of opinion may exist, from time to time, as to policies or personnel should be subordinated to the decision of those upon whom the responsibility is placed.

W. W. Roblee, President.

Mission Inn Annex, Riverside.

EDITORIALS†

CALIFORNIA "HUMANE POUND LAW"

An Initiative Law, to Be on the Ballot in November.—A proposed measure, known as the "California Humane Pound Law," to be submitted, as an initiative statute, to the electorate of California next November, is already receiving, at so early a date as even the present, considerable newspaper space, with no doubt, later, much more to come. The statute has behind it several California and extra-state organizations that have submitted similar propositions (only under less alluring titles) to most of the California legislatures of recent years.

* * *

Importance of the Present Attempt.—The present attempt is worthy of special notice from the fact that more than 180,000 signatures of qualified voters were obtained to give it a place on the November state ballot, and because its proponents have secured the active support of many influential groups of citizens and press associations, to whom, without reflecting on the damage that could result to public health interests, through the enforcement of less desirable sections of the proposed law (discreetly kept in the background by the proponents of the measure), certain provisions and arguments evidently made a strong appeal. Much of the press publicity thus far given the promoters and their movement appears to be such as would influence the affection-emotions of dog owners, stressing the distress and sorrow they must naturally experience if they learned their dogs had been picked up, sent to a pound, to be later carried away and experimented upon under cruel conditions! With such expositions go other statements, usually culled from nonscientific sources, wherein the advances of medical science which have resulted from careful observation of research work on lower animals are much decried. Also flaunted to the fore are quite equally misleading provisions, when considered from the standpoint of how they would work out in actual practice.

* * *

"California and Western Medicine" Articles on the Subject.—Attention is called at this time to recent articles which have been printed in California and Western Medicine, because their perusal presents much of the information which physicians should have at their disposal when they cite to lay friends the undesirable features of this proposed initiative law. The articles referred to include: An editorial comment, on page 158, in the March, 1938, issue ("A Humane Pound Law Initiative" to be placed on the State Election Ballot in November, 1938); an article by Assemblyman James J. Boyle, on page 257 of the April, 1938, number ("As a Pharmacist Views the Proposed California Humane Pound Law"); and an article by Clinton H. Thienes, M.D., on page 258, in the April, 1938, issue ("Proposed California Humane Pound Law: How It Would Affect Medicine and Pharmacology").

In proper time, members of the medical profession will receive further information pertaining to this subject from the California Society for the Promotion of Medical Research; but, meanwhile, a review of the articles noted above may not be amiss.

1938 IS A CALIFORNIA ELECTION YEAR: WHAT SHOULD THAT MEAN?

Hundreds of New Laws Proposed to Every Legislature.—Every state legislative session creates for the California Medical Association many new, and often serious, problems in public health administration, using this term in the broadest sense, to include the Medical Practice Act, since that law, enacted for the purpose of maintaining adequate healing art standards, has distinct public health implications. Past experience has shown that it is never possible to forecast specifically just what new statutes of a type to interest and be of importance to the medical profession may be introduced by members of the State Legislature.

* * *

Not Possible to Accurately Forecast the Nature of Public Health Legislation.—That is why the Association's Committee on Public Policy and Legislation is prepared to find almost anything as it picks up and studies, for possible public health involvements, the hundreds of measures that are dropped into the legislative hoppers every two years. That committee of the California Medical Association (consisting of Drs. Junius B. Harris

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

of Sacramento, T. Henshaw Kelly of San Francisco, E. T. Remmen of Glendale and, ex officio, both the president and the secretary of the Association) bears the brunt of safeguarding the interests of Californians in so far as public health needs come into the picture. Particularly onerous has been the burden borne these many years by Doctor Harris of Sacramento, who, in season and out of season, has given unselfish and efficient service to the profession and to the people of California.

* * *

How Individual Members May Aid.—The purpose of now mentioning the work of the Committee on Public Policy and Legislation in this wise is to make the more than six thousand members of the California Medical Association appreciate their own collective and individual responsibilities in these important activities, which recur once in each biennium; and particularly to stress the necessity, on the part of physicians from one end of California to the other, of being alert in these matters, not in January of next year, but now, today, at the very time when candidates from the different political parties, in a bid for ballot support, are announcing their platforms and filing petitions. In every county medical society, a specific committee (or the administrative officers, acting as such) should keep a file of candidates, noting their backgrounds and possible affiliations, with special reference to their attitude on public health policies. Every voter has a right to find out from a candidate what are the general views of the aspirant who seeks office as a state assemblyman or state senator; and candidates in their initial campaigns are nearly always willing to align new support through exchange of views. It is just here, in efforts to learn the reactions of candidates to sound public health policies, that every physician who wishes to do his bit in support of the Committee on Public Policy and Legislation can be of real aid. Particularly important can be the rôle taken by attending physicians of candidates, since those members of the medical profession are favorably placed for confidential exchange of views.

* * *

Informative Data Should Be Sent to the Central Office of the Association.—All such information, if transmitted to the central office of the Association, can become of real value in determining who, among the numerous Assembly and Senate aspirants, give indication of broad and sound outlook on public health policies. Members of component county societies are urged, therefore, to note newspaper and other comments about legislative candidates, and through their local committees and officers to send such data to the Association's committee. The August primary election is not many days off. Much future conflict may be avoided if the candidate from each political party who is successful in the primary election has sound public health views. The end-results to be attained are surely worthy of the comparatively slight effort that can be successfully used, provided that effort be made at the right time, namely, *now!*

THE FIGHT AGAINST SYPHILIS

Intensive Nature of the Campaign Against Syphilis.—Physicians who participated in the initial campaigns designed to create public opinion that would support organized and large-scale efforts to combat tuberculosis, and remember what exertion was then necessary, must have a natural interest in the work launched by the United States Public Health Service and the American Social Hygiene Association in the fight against syphilis.

Only two years ago, when a local society was founded in one of the metropolitan centers of California to take up the struggle against the spread of venereal diseases, the representatives of certain newspapers stated that their chiefs would not give publicity to items for their columns if the word syphilis was used. Today, after a short period of intensive propaganda, the press throughout the United States is giving more or less whole-hearted coöperation. All this bodes well for the future.

* * *

United States Public Health Service Leaflets. In this issue, in the Letters Department, on page 96, attention is called to a new leaflet on "Syphilis, Its Cause, Its Spread, Its Cure." Although written for laymen, nevertheless it should be of interest to members of the medical profession. Still another leaflet was referred to in a letter received from Assistant Surgeon-General T. A. Vonderlehr, and given on page 474 of California and Western Medicine for June. Both leaflets—to be had from the Superintendent of Documents, Washington, D. C.—are well worthy of perusal.

AMERICAN MEDICAL ASSOCIATION SESSION AT SAN FRANCISCO

San Francisco Session Voted a Success.—The eighty-ninth annual session of the American Medical Association, held at San Francisco during the week of June 13, has come and has been voted a great success, both by physicians from other states and by members of the California Medical Association. Much praise is due both the American Medical Association and San Francisco committees, who had the arrangements in charge.

The meetings of the scientific sections, and other features, such as scientific and commercial exhibits, received most favorable comment.

The transactions of the House of Delegates will appear in the *Journal of the American Medical Association,* and should be scanned by all physicians who would keep in touch with current policies on medical practice, as announced through this official body of the organized medical profession of the United States.

* * *

Dr. Howard Morrow of San Francisco Becomes Vice-President of the American Medical Association.—California was honored last year by the election of Dr. Junius B. Harris of Sacramento as vice-president, and this year the same honor was tendered Dr. Howard Morrow of San Francisco, who, at the Pasadena session in May last, retired as president of the California Medical Association.

Elsewhere in this current number are reprinted some newspaper paragraphs giving further information concerning the American Medical Association session at San Francisco.*

ANNUAL JOINT MEETINGS WITH RELATED PROFESSIONS

Individualization in Medical Practice a Fundamental Element in Medical Progress.—Individualization in medical practice—meaning thereby the relation of the individual patient to his individual physician—is something that has existed since the beginnings of the healing art. With, however, the advent and promulgation, in recent years, of plans put forward by sociologists and others, and asserted by them as capable of providing a better system of medical care than that which has been responsible during the last several decades for much of the amazing advance in medical science leading to a notable prolongation of human life, it has been necessary to emphasize and reemphasize the value of this individual relationship between physician and patient, and its significance to medical progress.

* * *

In Civil and Political Life, Conjoint Effort Is Necessary.—Valuable as individualization may be in relation to the care of patients, it does not follow, in matters related to civil and political life, that such a system should likewise obtain. The citizen seeks the physician in whom he has confidence, and the physician, in turn, knowing that his success in professional life depends upon his alertness to the advances in medical science, seeks to use all methods that will aid in the conservation of human health and life.

In the political system under which we live, however, our lawmakers and civil administrators respond best when the considered opinion of influential persons is presented to them through organized groups of citizens having closely related professional, vocational, trade, or other affiliations. The prevention of the enactment of undesirable laws and ordinances is often more easily accomplished than their repeal; provided, that the appropriate presentations, at the proper time, are made to the statute makers, be they legislators, supervisors or councilmen, by responsible, authoritative and influential groups.

* * *

Close Association of the Professions of Medicine, Dentistry, Pharmacy, Law, Veterinary Medicine and Nursing.—The professions of medicine, dentistry, pharmacy, veterinary medicine, nursing, and even of the law, in these recent years, are constantly confronted with problems, such as corporate practice, in which the principles involved apply equally to each of the above professions, and are worthy, therefore, of the united opposition of these six professions, one or more of whose members practically have contacts of worth with virtually every family in the State of California.

Medical Profession Should Lead in Maintaining Contacts with Related Guilds.—How may this conjoint effort and action be best secured? In this endeavor, the medical profession, through its state and county units, and their official local subdivisions, should not hesitate to take the lead, if necessary. The objectives can be easily realized if every county medical society, each year, will invite the official organizations of their respective communities, representing dentistry, pharmacy, law, nursing and veterinary medicine, to be guests of the medical profession at joint meetings, with short speeches on pertinent topics by members of the two professions in session, to be preceded or followed by an informal dinner or supper or buffet refreshments.

Such meetings are certain to be found thought-stimulating, and are valuable also for the fraternal fellowships and better understandings that can then and there be so engendered. Program committees are urged to give these suggestions their consideration, and especially, in this election year, to bring about, if possible, such conjoint meetings prior to the final elections in November. In the past, such gatherings have been found most useful; and today, they are as important, and more than ever needed.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 69.

EDITORIAL COMMENT†

HOW SAFE IS THE OPERATION FOR LENGTHENING LEGS?

An operation that will add two to three inches of length to a short leg is highly desirable from several points of view. The strongest appeal from the patient's standpoint is the cosmetic one; but there are other valid reasons to make this particular operation a valuable asset to the orthopedic surgeon's armamentarium.

In the case of a weak leg of poliomyelitis, making the leg lengths equal reduces the load of the heavy, raised shoe. Many of these patients must and are physically able to take their place in the commercial world, but their chances of finding employment while wearing an unsightly raised shoe is definitely decreased.

During the past eight years, at the Orthopedic Hospital in Los Angeles, we have done seventy-five leg-lengthening operations. This shortening has been associated with a variety of conditions, such as poliomyelitis, spastic hemiplegia, hemi-ectromelia,

* For these news items, see page 100.

† This department of CALIFORNIA AND WESTERN MEDICINE presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

fracture of the femur, and shortening due to osteomyelitis and tuberculosis of the hip and knee.

With an experience such as this, study of the end-results has helped crystallize certain opinions, and has given valuable information on such points as type of patient, the age, the site of operation, certain dangers, and other important data that must be considered before such an operation is decided upon.

I have no hesitancy in stating that in the hands of competent men this operation is safe and practical when the lengthening is done below the knee. In 90 per cent of the cases the operation has proceeded without mishap, the predetermined length obtained, and an end-result accomplished that was highly satisfactory to the surgeon and to the patient.

In a few instances, unpleasant situations have arisen, but there has been no mortality, and in no case has the limb been threatened. Occasionally, when dealing with very small leg bones of poliomyelitis patients, solid union has been delayed, so that protection against full weight bearing was required for two years. In a few, a low-grade, late infection developed with sequestration of bone, but in each instance the leg healed in time and the end-result was not impaired. In three cases, one of the bone tongues was accidentally fractured at surgery, which, of course, meant that the lengthening process had to be given up and the bone treated as a fracture.

While the younger patients tolerate the stretching of the soft tissues which must go on during the lengthening process of the bone, yet if the operation is done much before the age of twelve or fourteen years, there may be again considerable inequality of leg lengths by the time the epiphyseal lines are closed. In most cases where lengthening was done around twelve years, the short leg continued to grow in length as fast as the opposite leg, but there were several notable exceptions. In these patients, all poliomyelitis, there was a rapid growth in height following the operation. A year later the legs were equal, but several years later when the epiphyses of the tibia had closed, the paralyzed leg was an inch short.

Lengthening of the femur is a much more formidable procedure. The upper pins are in a potentially contaminated field, and are in close approximation to the femoral vessels and nerve. An infection here might give considerable concern. In this series, it was necessary to remove the pins for this very reason before adequate length had been obtained.

Furthermore, the massive muscles of the thigh offer more resistance to stretching, making it more difficult to maintain good approximation of the bone fragments. In several of the older patients, there occurred considerable fibrosis about the knee on account of the stretching and tearing of the soft tissues which brought about a marked restriction of knee motion. This hazard is further increased because of the long period of time it is usually necessary to immobilize the femur in plaster before union is advanced.

In the younger poliomyelitis patients the operation is easier; also in those patients in which the hip is fused, as from tuberculosis. In the latter case, the proximal fragment is fixed, and it makes easier the maintenance of good alignment.

Follow-up studies of seventy-five patients over an eight-year period have given assurance that lengthening of the leg below the knee is safe and practical; but operation above the knee is difficult, and carries a definite hazard. It should be performed only upon a very selected type of case, and even then the operator must be fully cognizant of the several pitfalls that may lie ahead of him.

METASTASIS

Every student of the cancer problem recognizes the fact that its solution lies in the understanding and control of metastasis. Though cancer patients do recover even when metastasis has taken place, it is only when the first group of nodes is involved, for they still may be removed completely by surgical means or destroyed in toto by radiological methods. The production of cancer by painting the skin with benzine ring compounds, or by the use of ovarian hormones, gives us an inkling as to the specificity of irritants that result in malignant transformation of cells, but it gives us no idea as to the cause of the migration of those or similar cells into other parts of the body.

Returning to clinical facts, why should a large, bulky, fungating malignancy of the tongue or the floor of the mouth result in late metastasis, while a small, insignificant, infiltrating lesion results in early metastasis into the neighboring nodes before the primary is discoverable? Or, why should an undifferentiated growth metastasize early and far, while the well-differentiated growth metastasizes late? What then, is the determining factor in the production of very malignant, moderately-malignant, or mildly-malignant cells? Experimentally, we know that a massaged breast tumor in mice leads to early extension to the nodes; the cells are milked into the lymphatic circulation, and they finally lodge in the primary node. Possibly muscular contraction forces them along the lymph channels and leads to dissemination, especially when the growth infiltrates from the beginning.

How many cells are needed to produce clinical metastasis? Theoretically, one cell should suffice, but does it work out that way? Gaetani and Blothner, working with transplantable tumors in animals, have estimated that an average minimum of 430,000 cells are needed to produce a viable growth, though 100,000 may at times result in a take. Possibly, a large quantity of cells is necessary to produce clinical metastasis in the patient; otherwise, why do some patients who have had a carcinoma of the breast removed come back ten years later with no local evidence of disease, but with a pathologic fracture of the humerus, the femur, or with a vertebral destruction—or why does a patient who has had an eye removed for a malignant melano-epithelioma die of metastasis to the liver ten to fifteen years later, with no other evidence of melanoma? Surely these cells must have entered

the circulation before the operation or during the operation, but what accounts for their renewed activity after "sleeping" so many years?

That metastasis is much more prevalent in the cancer patient than ordinarily believed has been brought out by Maner and Snure in a fine piece of work. They have shown that metastases to the lumbar vertebrae from carcinomas of the stomach are demonstrable grossly and microscopically in a large percentage of cases that came to autopsy, even though no clinical or radiological evidence is present. In these cases, when a wedge of the lumbar vertebra is removed at the postmortem table and radiographed, there is no evidence of metastasis visible on the film. In other words, the organism may be saturated with malignant cells and still we have no way of demonstrating this clinically. Likewise, Shields Warren, in his "Studies on Tumor Metastasis," has shown its frequency in the spleen. The literature is full of statements to the effect that the spleen is rarely involved; and various explanations are offered to substantiate such statements. It is true that, grossly, the spleen is not often involved, but, microscopically, malignant cells are quite prevalent.

In the wear and tear of life in the organism, what becomes of the old, worn-out normal cells? Are these destroyed in situ by lytic substances, or are they extruded into the lymphatic circulation or into the blood stream, to be destroyed by the reticulo endothelial cells of the lymph nodes, or in the spleen? If they are destroyed locally, one should be able to demonstrate them occasionally in microscopic sections. We do know that the old and decrepit red blood cells are disposed of in such a manner in the spleen. Is it not possible, then, that such a phenomenon is a normal procedure in the body economy? Malignant cells with no function to perform are but invaders, and are pushed into the circulation to be filtered out. The Canti film shows that cancer cells cultivated in vitro take on ameboid movement, which could explain such a step. What, then, determines clinical evidence of metastasis? Two factors are at work; first, the quality which may determine the location, and, second, the quantity of cells which results in clinical manifestation. Breast, thyroid and prostate have a predilection for bone; melanoma for liver. In those organs the cells may lie dormant or may grow. When the organism has been weakened by some unknown factor, the quantity of cells is the determining force, for then other organs are involved. Years ago Cohnheim said, "Only when and where tissues are lowered in their physiologic metabolism by age, atrophy, and inflammation, will metastasis be possible."

We have known for a long time about the Freund-Kaminer reaction, namely, that the serum of a carcinoma patient will not digest cancer cells, but the serum of a normal patient does. Is it possible that certain lytic substances are present in the serum that maintain a normal balance; when this is destroyed by age or inflammatory disturbances the destruction of cells outside their normal sphere is disturbed, qualitatively and quantitatively?

Millions of dollars have been spent in research, some of it wisely, some of it wastefully. In these times of economic distress and civic illness, every man, be he rich or poor, has an opinion as to the causes of and remedies for the depression. So, too, in cancer, every man, be he a trained worker or a clinician who sees only an occasional case, has an opinion as to the nature of cancer and what may be needed for cure. As we grow older, we all become armchair philosophers, forgetting the really fundamental problem. Why do these cells begin to wander and why do they grow in distant locations? The simple fact remains, we are doing more, or attempting to do more, for the cancer patient than we have ever done by surgery and radiation, but despite our research we have learned very little about the spread of carcinoma per se. Research must, therefore, be carried on to answer some of the questions raised; some of this research will, of course, be useless. Remember, though, the salmon, it lays a million eggs in order that one may survive to carry on the species. So, too, in cancer, a thousand valueless experiments must be performed before one that will be worth while results. We should not be satisfied with the production of malignancy alone, but rather try to fathom the mystery of cell migration and metastasis to reach a satisfactory conclusion.

SENILE PARALYSIS AND VITAMIN E

Two years ago, Dr. G. O. Burr [1] and his associates of the Departments of Botany and Anatomy, University of Minnesota, placed a group of eight recently weaned female rats on a highly purified, fat-free basal diet (550-B), supplemented by vitamins A and B, viosterol, fat-free yeast, and linseed oil. The only factor known to be low or absent from this diet was vitamin E. At the end of one year the animals had increased to an average weight of 172 grams. During the second year three of the animals died of unknown causes. The five surviving rats became paralyzed with loss of use of their hind limbs at approximately twenty-two months of age. The striking feature was the incidence of this senile paralysis at exactly the same age in all five animals. Efforts to effect a cure by the addition of large doses of vitamin E to the daily diet were unsuccessful. Similar senile paralyses in vitamin E deficient rats have been noted by Doctor Evans [2] of the University of California. The deficiency paralysis is limited to the hind legs, and is apparently neither completely motor nor completely sensory in character. The muscles are not noticeably atrophic. Certain cell groups in the brain and spinal cord of the few rats thus far autopsied showed yellow pigmentation. The possibility that the immediate cause of the deficiency paralysis is a microbic or virus infection, however, has not yet been excluded.

SYPHILIS IN RELATION TO SURGICAL PROBLEMS*

By Udo J. Wile, M.D.
Ann Arbor, Michigan

THE clinical course of syphilis may be said to follow a certain orderly sequence. The frequent deviation from this sequence of clinical events contributes to a mimicry of medical and surgical conditions which constitutes a constant pitfall for the unwary clinician.

There are few fields—medical, surgical, or neurological—in which syphilis does not present problems directly caused by a syphilitic pathology. At the same time there is no morbid condition which, under certain circumstances, syphilis may not so closely approximate that its intrusion into any field or any pathologic picture must always be assumed as possible. Failure to recognize or to appraise this sooner or later brings its humiliating awakening.

PROBLEMS HERE CONSIDERED

Syphilitic morbid conditions as they enter into the field of surgery present problems, both of prognosis and diagnosis. In this essay I shall present first the problem of the syphilitic as a surgical risk, next the surgical conditions directly caused by the syphilitic infection, or otherwise stated, the syphilitic condition calling for surgical intervention, and lastly I should like to discuss and to illustrate examples of syphilitic lesions which so closely approximate surgical conditions that the differential diagnosis is frequently difficult, and failure to recognize their syphilitic nature frequently leads to needless operative procedures.

I. THE SYPHILITIC PATIENT AS A SURGICAL RISK

The syphilitic, whether in the earlier or later stages of his disease, must be carefully appraised with regard to his infection when he presents himself as a surgical problem, whether this be an acute condition or one in which operation is indicated but may be delayed. The patient with an acute syphilis complicated by an acute surgical condition presents first a certain risk to the operator from accidental infection. More often, however, the problem is one of a happy surgical result in the presence of a syphilitic sepsis which, for the time being, may have to be disregarded in the light of an acute surgical emergency.

ACCIDENTAL INFECTIONS AMONG PHYSICIANS

Turning first to the danger to the operator himself, the majority of cases of accidental infection among surgeons and obstetricians have occurred from trivial injuries sustained during operation through definite contact with the infected blood of the patient. Such accidental infections were certainly more common before the universal use of rubber gloves, but they are still occasionally encountered and should be regarded as absolutely preventable accidents in practically all cases. The routine careful examination of a surgical patient and a preliminary biologic test of his blood would indicate the presence of syphilis in any patient except for those cases in which the infection had been so recent that the blood was still negative. Where an active infection is present, and unless a serious emergency exists calling for immediate operation, the patient may in a short time be properly fortified by treatment, so that the risk of contamination by his blood is a negligible factor. Such a temporary sterilization can be effected in three or four days. Where such delay is impossible and obviously such conditions exist, the presence of an acute syphilitic infection, or indeed a chronic one as evidenced by a positive serologic test, calls for extreme care on the part of the surgeon lest he injure himself and become accidentally infected. Most syphilologists see cases each year in which disregard of these precautions results in accidental infections acquired during an operative procedure.

TREATMENT WHEN POSSIBLE INFECTION OCCURS

If during an operation in which the necessary precautions have been observed, an accident still happens in which a puncture wound might lead to the possibility of infection, the prompt enlarging of the wound, permitting free bleeding, and its immediate treatment with a strong calomel ointment is excellent prophylaxis against infection. If the patient be in that period of his disease, immediately before, during or shortly after his exanthem, the additional precaution of two or three injections of an arsphenamin is indicated as well as local treatment of the puncture wound. In several instances in which puncture wounds have occurred during operation, the procedure just outlined has never, in my experience, been followed by an accidentally acquired syphilis.

RECENT SYPHILITIC INFECTIONS IN RELATION TO OPERATIVE PROCEDURES

Viewed from the standpoint of the patient, a septic case of syphilis may be seriously damaged by a rapid dissemination of the infection through operative procedure. Where a few days' delay for preliminary treatment is not possible, such patients should receive at the earliest moment after operation, treatment which serves to offset a rapid dissemination of their infection. The presence of an active syphilis can at the same time seriously affect the desired surgical result. The spirocheta naturally gravitates to places of least resistance. Points of surgical operation constitute ideal foci for the development of acute syphilomata, and a serious and unfortunate surgical result may, not infrequently, occur because of the intrusion into the site of injury of a syphiloma. Such untoward surgical results are frequently seen in such conditions as fractures, dental extractions, and may be seen in any form of otherwise clean surgical procedures. The prompt treatment of the syphilitic

* Guest-speaker address given at the first general meeting of the California Medical Association during the sixty-seventh annual session, Pasadena, May 9–12, 1938.

Studies and contributions of the Department of Dermatology and Syphilology, University of Michigan Medical School. Service of Dr. Udo J. Wile.

patient who must undergo acute surgery will almost invariably obviate such unfortunate results.

RISKS TO OPERATOR AND PATIENT WHEN OLD SYPHILIS EXISTS

The patient in whom an old syphilis exists may be appraised somewhat more favorably as regards his risks for acute or delayed surgical procedure. Patients of this type who have had syphilis for a long time, even if untreated present a very unlikely risk to the operator, who may become contaminated with the patient's blood. Such a risk, however, is not entirely negligible, and undoubtedly a few infections have occurred from old untreated cases. Where there has been a good background of treatment, an old syphilitic, either serologically negative or positive, has, in my experience, never been the source of an accidental infection during surgical operation.

The risk, however, to the patient of this type still obtains; particularly is this true of the so-called latent syphilitic patient and one in whom there has been a poor background of treatment or none at all. The anticipated happy outcome of operation is occasionally replaced by a humiliating, sloughing, nonhealing wound, the result of an actual gummous syphiloma developing in the operative field. Such lesions are difficult to appraise as syphilomas by reason of the presence of secondary infection, and because their syphilitic nature has been definitely altered by the operative procedures. Operations on the long bones, on the jaw, on the bones of the head, in plastic surgery, are just a few of the many instances in which I have seen such untoward and preventable mishaps.

IMPORTANCE OF ROUTINE SEROLOGIC PREOPERATIVE BLOOD TEST

Cases of this kind can readily be prevented in the vast majority of cases by the routine serologic preoperative blood test. This simple precaution now taken in many hospitals should be routinely insisted upon by all surgeons.

I am quite certain, from my own experience, that such accidents are not so prone to occur in hospitals where routine procedures are usually the rule, but are more apt to happen in the private practice where the patient's social status or, as frequently, his advanced age have been factors in disregarding the possibility of the existence of old syphilis.

When an untoward surgical result has been properly evaluated as a syphilitic accident, prompt treatment usually leads immediately to satisfactory healing, but is frequently complicated by cicatricial contractions or residua which could have been avoided had the patient's syphilis been properly appraised before operation.

PROPER APPRAISAL OF THE SYPHILITIC INFECTION

I may be permitted to emphasize at this point that the finding of a positive test of itself does not necessarily constitute an invariable contraindication to immediate surgical operation. The all-important question where such a finding occurs is the proper appraisal of the syphilitic infection indicated by the test. The first factor to be determined is the duration of the infection. As has been stated before, generally speaking the older the infection the less is its importance, viewed from the standpoint of the patient as a surgical risk. Of far greater importance, however, is the determination of the amount of treatment in the background of the patient's infection. If the infection has been adequately treated according to modern standards, particularly during the early years, even if there has been only a fair background of antisyphilitic treatment, the risk of untoward surgical result is very slight and operative procedure need not be delayed. If, however, the patient is in a latent stage with little or no background of treatment, then, unless the emergency is great, happier surgical results will be achieved if operation is postponed until the patient has been properly fortified. Short preoperative treatment combined with the continuance of treatment during convalescence is then indicated and invariably results in no interference from the latent syphilis in the operative field.

During the past twenty years, during which routine serologic tests have been done on all patients in the University Hospital in which I serve, we have found that two or three injections of an arsphenamin with the simultaneous administration of bismuth or mercury over a period of about two weeks, have sufficed to protect all patients against any unhappy surgical result, provided this treatment is continued during the period of surgical convalescence.

Under such a regimen I have never seen an old syphilis lighted up through surgical trauma or a surgical wound complicated by a syphiloma. Where such have occurred they have invariably been due to a slip-up in which for one reason or another the syphilis has either been ignored, improperly appraised, or unsuspected.

II. SURGICAL CONDITIONS DIRECTLY CAUSED BY SYPHILITIC INFECTION

There is little written in surgical texts concerning the surgical indications of syphilitic disease, and yet there are definite syphilitic entities which call for a combination of antisyphilitic treatment and surgical measures before they may be properly corrected.

Generally speaking, these are usually late sequelae of syphilitic disease. Of foremost importance are the many cases of osteomyelitis involving the long bones, and those of the skull in which definite sequestration occurs. Next are cases of gumma of the testis, gumma of the spinal cord, gumma of the eye, obstructive and cicatricial changes the result of old syphilitic ulcerations, such as not infrequently lead to dysfunction and obstruction. Among the latter deserving of particular mention are strictures of the esophagus, stricture from old syphilitic ulcer of the stomach, and adhesive peritonitis affecting the colon and sigmoid, and occasionally rectal strictures.

Gummous arthritis, and osteoarthritis very occasionally associated with pyogenic infection of the joint, must also be mentioned. Cases frequently associated with neurosyphilis, such as mal perforans and Charcot's arthropathy, also occasionally call for corrective surgical measures.

Syphilitic Osteomyelitis:

Syphilitic osteomyelitis not only calls for surgical intervention for successful treatment of the condition, and the removal of diseased and sequestered portions of the affected bone, but this condition when caused by syphilis presents a striking mimicry to other forms of osteomyelitis. Surgical intervention alone, without the supportive background of antisyphilitic treatment, is fraught with failure to the same degree as antisyphilitic treatment in such cases without surgical intervention. I have seen a number of examples of syphilitic osteomyelitis in which this mimicry occurred, some of which I shall hope to show in lantern slides at the conclusion of this paper.

Gumma of the Testis and Gumma of the Spinal Cord:

Gumma of the testis and gumma of the spinal cord are two notable exceptions to the rule, that it is unwise to touch the knife to purely syphilitic conditions. In the testis there is a most rapid destruction of the entire organ and almost immediate fixation to the overlying skin. No amount of antisyphilitic treatment can prevent the complete disintegration of the organ after a gumma has established itself in the testicular body. The entire parenchymatous structure of the testis rapidly breaks down and the condition as soon as diagnosed calls for immediate castration, followed of course, and preceded if possible, by thorough antisyphilitic treatment to insure a satisfactory surgical result.

What applies to the testis is even more true of gumma, as it occurs in the spinal cord. In the brain, gummas readily resolve under prompt and energetic antisyphilitic treatment, and as a rule these call for no surgical intervention, although here again the mimicry of the condition to brain tumor leads frequently to erroneous diagnoses and to operative procedures which could be avoided. In the cord the gumma develops so rapidly as a rule, and pressure myelitis and degeneration are so great a danger, that it is not safe to wait for the resolution of the gummous lesion by antisyphilitic treatment.

Where this condition can be diagnosed before operation or is found at the exploratory, the gumma should be quickly removed and the patient then thoroughly treated to avoid extension of the process.

Gumma of the Eyeball:

With equal rapidity does an extensive gumma of the globe destroy the appearance as well as the usefulness of the eye. Such a lesion rapidly destroys the entire eye, and the condition as soon as diagnosed calls for enucleation as soon as the patient has been thoroughly treated. The process is so rapid that preliminary treatment is only given together with postoperative treatment to insure a good surgical result and to protect the patient against further syphilitic sequelae.

Osteomyelitis of the Small Bones of the Head:

Of particular interest to the otologist and the rhinologist are the occurrence of osteomyelitic processes in the small bones of the head. These occur as gummous lesions, both in the acquired and in the congenital form of the disease, involving the delicate structure of the intranasal skeleton. These bones are rapidly sequestered, and their removal by surgical procedure, together with prompt and energetic specific treatment is essential in all cases to produce an ideal result and to limit an otherwise rapidly spreading condition.

Cicatricial Contractions:

Concerning the obstructive changes, these are usually due to cicatricial contractions as a result of the healing of old syphilitic ulcerations. The constricted stomach from old, healed gastric syphilis often presents a situation calling for such a bypath operation as gastro-enterostomy. Cicatricial contractions of the esophagus as the result of old syphilitic ulcers may be relieved by bougie dilatation. The very occasional strictures of the rectum, for the most part inoperable, may occasionally be relieved through surgical removal. Late investigations would seem to indicate, however, that many of such previously regarded syphilitic strictures are due to lymphopathia venereum—the most, in fact, in all probability. There are still, however, occasionally found rectal strictures which are the sequelae of slow healing ulcerative gummous proctitis.

Plastic Peritonitis:

Very little recognized is the association of plastic peritonitis in latent syphilitic individuals following abdominal operations. I have not seen this reported elsewhere, but I am quite certain, from my own observations, that the occasional occurrence of peritoneal adhesions, which later give rise to pain, sometimes to definite intestinal obstruction, can be ascribed to the presence of unsuspected latent syphilitic visceral disease.

I have particularly seen this occur in cases of syphilitic cirrhosis, and following operation for gastric disease, either ulcer or cancer, where the condition was later determined to be either gastric or perigastric syphilis.

Such forms of plastic peritonitis, due to visceral syphilis, need not, however, follow operation, but occasionally occur during the course of chronic syphilitic disease, particularly of the liver, stomach and spleen, and are not infrequently found present when the patients are operated upon for one cause or another.

III. DIAGNOSIS OF SYPHILITIC LESIONS CLOSELY APPROXIMATING OTHER SURGICAL CONDITIONS

I should like now to direct attention to the many syphilitic conditions with surgical mimicry. These perhaps constitute the most important phases of the surgical aspects of syphilis, inasmuch as they are frequently the sources of error in diagnosis and lead to surgical attack where this is entirely unnecessary.

Chancre and Cancer:

First and foremost is the mimicry which exists between the chancre and the cancer. How many

surgeons of long experience can say that they have not fallen into error in mistaking the primary lesion of syphilis for a cancer when this occurs on the lip or tongue or breast?

In the days before the discovery of the spirochete and before the introduction of diagnostic blood tests there was perhaps some excuse for an occasional error of this nature.

In these days, where the clinical diagnosis can be substantiated by such accurate laboratory methods, the removal of a breast, of a tongue, of the lip, or the penis, when syphilis is mistaken for cancer, constitutes an inexcusable error. The time is too short to enable me to elaborate upon the differential diagnosis between the genital and extragenital sore, and the cancer in the corresponding areas. In the main, there are sufficient clinical criteria to enable the careful diagnostician to make a diagnosis without laboratory aid.

There are, however, occasional cases in which the traumatized chancre can so closely simulate the cancer that the most careful clinical analysis fails to establish clear differential diagnostic criteria. Under these conditions the laboratory aid, with the demonstration of the infecting organisms or the biologic test, or both, as well as the biopsy, will serve to prevent a serious error in diagnosis. In the case of the finger chancre, the majority of cases which I have seen have all been mistaken for some form of paronychia and have been incised or otherwise surgically treated.

Gummous Lymphadenitis and Tuberculous Disease:

Of great interest are the occasional cases of gummous lymphadenitis affecting particularly the glands of the neck and simulating closely tuberculous disease. The points of differentiation clinically are not very clear-cut. Nevertheless, they are sufficiently definite, together with the laboratory diagnostic criteria, to enable one to establish a diagnosis if sufficient time and thought be given to it. I have seen gummous lymphadenitis also confused with Hodgkin's disease and lymphosarcoma.

Syphilis of Long Bones and Tuberculosis and Sarcoma:

Syphilis of the long bones, simulating either tuberculosis or sarcoma, is another excellent example of syphilitic mimicry in a definite surgical field. Together with these are the frequent cases of syphilitic osteomyelitis, particularly those on the skull, tibia, on the radius and ulna, clavicle, ribs and sternum, which quite often are incised in the supposition that they are some form of septic or pyogenic disease. In connection with the bursae, it should be remembered that the prepatellar bursa and that over the olecranon are peculiarly disposed to gummous involvement, and as they are also frequently the site of traumatic bursitis an obvious confusion as to their nature can exist.

Gastric Syphilis and Other Gastropathies:

Simulating other gastropathies are the various forms of gastric syphilis. These occur in the form of round and serpiginous ulcer and of gummous tumor simulating cancer.

Clinically, and even from the standpoint of the x-ray, there are no adequate criteria to establish the differential diagnosis between the various forms of gastric syphilis and other forms of gastric pathology which they so closely simulate.

Syphilis may produce a round ulcer either by thrombosis and infarction or by gummous ulceration which is indistinguishable from peptic ulcer. The more diffuse form of ulcerative gastritis due to syphilis is clinically indistinguishable from other forms of ulcerative gastritis. Solitary massive gummas of the gastric wall present the typical picture of gastric neoplasm.

For the most part, the diagnosis of these forms of syphilitic disease is an operative, pathological, or postmortem finding. They constitute the most striking examples of syphilitic mimicry.

In a syphilitic individual, the occurrence of gastric disease which proves unamenable to the accepted forms of treatment should always be investigated with the possibility that one may be dealing with one of the many forms of gastric syphilis.

I shall hope presently to demonstrate some interesting cases of gastric syphilis which were mistaken for cancer or ulcer and some of which would have been operated upon had the syphilitic nature of the condition not been suspected.

Neurosyphilitic Disease:

Lastly, reference might very profitably be made to the various manifestations of neurologic syphilitic disease which present conditions not infrequently mistaken for surgical indications. Of greatest frequency are the gastric crises, the abdominal crises, hepatic and gall-bladder pain, crises involving the uterus and bladder, all due to tabes dorsalis and all of them occasionally surgically treated by reason of their simulating various forms of the acute abdomen.

Syphilis and Abdominal Crises of Tabes:

What surgeon of experience has not at some time operated for what he believed to be gall-bladder disease or gastric disease, to find a completely negative abdomen and nothing else to substantiate a sharply localized pain and abdominal distention which so eloquently bespeak the acute abdomen? It is no uncommon finding in old tabetics to ascertain the history of surgical intervention for crises, and to meet with telltale scars indicating operative interference. I have many times seen tabetics who have had not only such exploratory operations, but who have had gall-bladders removed or drained, or who had had gastro-enterostomies performed, needless to say with no relief of the symptoms for which they were operated upon. Cases of this kind are frequently more or less obscure types of tabes in that they are not ataxic individuals.

The findings of greatest importance in establishing the true nature of such conditions of surgical mimicry are those of the eye. I think it is a safe statement that no case of gastric, abdominal or other form of tabetic crisis occurs without pupillary disturbance which would enable a diagnosis of cerebrospinal disease to be established. Of secondary importance, but also frequently present, are

the conditions of the tendon reflexes and other neurological findings of the motor and sensory systems which for the most part can be determined, together with the blood and lumbar puncture findings to substantiate, from the laboratory, the clinical picture of tabes.

At this point it must be stated that patients who have a definite locomotor ataxia may, nevertheless, have a gastric or duodenal ulcer which might readily be mistaken for some form of crisis. A few years ago this picture was indelibly impressed upon my mind by a tabetic whom I had been treating for his cord disease and whom we believed to have gastric crises. His x-ray studies were entirely negative for any pathology in his gastro-intestinal tract. His symptoms were in no way relieved by any form of treatment and he very suddenly died from acute hemorrhage. At the postmortem he was found to have a very small duodenal ulcer which, although undemonstrable by the x-ray, nevertheless led to perforation and to erosion of a large vessel which resulted in his fatal hemorrhage.

IN CONCLUSION

In conclusion, syphilitic disease presents itself to the surgeon from many different angles. The evaluation, therefore, of the individual with syphilis, first as a surgical risk, and second, in appraisal of his syphilis as a possible cause of a surgical condition, is of vital prognostic and diagnostic importance.

Syphilis may be said, in the main, to have a casual rather than a causal relation to surgical problems. The proper appreciation of its occasional rôle as a causal factor would lead to happier end-results, less accidental infection, less unnecessary surgical intervention and a clearer concept of the devastating effect, which, through its ubiquity, syphilis may have on all other morbid processes.

STATE-WIDE MENTAL HYGIENE PROGRAM: ITS IMPORTANCE TO CALIFORNIA*

By F. O. Butler, M.D.
Eldridge

THE need for a well-rounded-out program of mental hygiene in California has been apparent for many years.

The nation as a whole has recognized this, hence the starting of the National Committee for Mental Hygiene in this country a number of years ago.

This year Canada, our sister country on the north, will be celebrating the twentieth anniversary of the birth of the Canadian National Committee for Mental Hygiene.

In Paris, last year, was held the second International Congress on Mental Hygiene, the first having assembled in Washington, D. C., in 1930. It took the founders of this congress twenty-two years to work up such a world organization. In 1930 fifty-three foreign countries were represented, and last year a similar number were registered in Paris, indicating quite clearly that the world is awake to the necessity of mental hygiene on a broad scale.

CALIFORNIA'S MENTAL HYGIENE SURVEY OF NINE YEARS AGO

California did take quite a definite step nine years ago by sponsoring a mental hygiene movement. A legislative measure, appropriating $20,000, was passed to make a survey of the situation and the importance of establishing a program, but, unfortunately, the depression immediately followed, which probably was the chief reason for the survey not being used to advantage.

This survey, headed by Dr. Frederick H. Allen of Pennsylvania, a very capable man, under the sponsorship of the State Department of Social Welfare, after an exhaustive study of approximately two years, did give some very definite and splendid recommendations, many of which will still apply at this late date. However, it is too bad to have to report that the results of this $20,000 expenditure were put to no practical use. Conditions naturally have changed materially since that report was made, but fundamentally they are just as sound today as they were then. Therefore, it should appear to all those in California who are vitally and directly interested, and to those who should be, that we should start in where this survey ended, or on a new basis, if necessary, and develop and carry on a mental hygiene program, as such, for the best interest of the population as a whole. In fact, it is quite evident that the need of something of this kind is most essential, since so many people from other states are coming to California by the thousands each month, both because of conditions in other states and the new laws and programs for aid which have been put in effect here in the past few years. This is particularly manifested by those seeking aid from various local agencies in the communities and the early requests for admission to the various establishments within the Department of Institutions.

HOW CALIFORNIA IS MEETING SOME OF ITS PROBLEMS

California spends approximately $90,000 each biennium for deporting mental patients back to their native states. If it were not for this arrangement our institutions would soon be filled with those from other states at the sacrifice of those entitled to admission by full residence requirements.

In many of the larger centers in the state and away from some of our state institutions, outpatient clinics are held, but on such a small scale that many cases are not reached until something happens to bring them to the attention of those concerned.

For many years mental hygiene clinics have been held by members of the staff of the Sonoma State Home in the twenty counties north of the Bay district. A recent survey was made covering the present fiscal year up to March 31. During this period 475 cases were examined. Of this number, 52.5 per cent ranged from low normal upward in-

* Chairman's address, Neuropsychiatry Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

From the office of the Medical Director, Sonoma State Home, Eldridge.

tellectually, the remaining 47.5 per cent from the borderline downward, thus indicating that the majority of the so-called normal individuals needed mental hygiene advice and treatment.

Many of these should have been examined much earlier. We find many children, who, if seen in the preschool age, would undoubtedly have profited by proper advice and treatment. It is much cheaper to maintain sufficient clinics in the communities than later to have to care for individuals in our institutions, both private and state. The first few years of a child's life are the formative ones, during which period the foundation is laid for adequate social habits. If all children could have proper attention early, both physically and mentally, it would be a great factor for their future welfare.

NONINSTITUTIONAL PROBLEMS

No state in the country has over, approximately, 10 per cent of their mentally deficient cases in state institutions, and it is this other 90 per cent that we should be especially concerned about. If this 90 per cent can be properly and adequately reached by a properly organized program, it would be money well and economically spent.

According to a survey made a few years ago by the White House Conference on Child Health and Protection, it was indicated there were at least two per cent who fell in the mentally deficient class.

Some states have developed a control on this type of case, and in one state the law provides for identification, registration, adjudication, prevention of marriage, and supervision in the community of all the mentally defectives in the state. It consists of a central or state commission, together with a subcommission in every county in the state, operating under the control body. If some such group could be developed in our state, to cover all phases coming under the general heading of mental hygiene, it would probably meet the requirements of our needs. With this general state organization as a working body, and operated as such, or placed under the authority of an already functioning state department such as the California Department of Institutions, which now has jurisdiction over all our mental patients, it would no doubt help to keep down considerable expense.

CALIFORNIA DEPARTMENT OF INSTITUTIONS: ITS EXPENDITURES

The Department of Institutions is now costing approximately $15,000,000 each biennium to operate and cares for about 26,000 cases, with an annual increase of about 800 mental cases and about 500 mental defectives. Unless some system of prevention and control is instituted, this burden will soon increase to the point that the tax burden will become so great that, instead of being able to care for more cases in our institutions, it will be just the reverse and we will revert to the old system of custodial care only. The last biennium the Department of Institutions spent $4,000,000 on buildings alone, and at this period at least $6,000,000 is being spent, besides a federal grant of 45 per cent of that amount. At the present rate of admissions it will require a similar amount continually to keep pace with this increase unless we do something about it.

THE NEXT LEGISLATURE

Since it is impossible in this brief paper to go into all phases of the necessity of a proper mental hygiene program for this big state, I wish to recommend to all interested workers in this field that steps be taken at once to revive such a movement in time for any legislative measures that might be considered necessary for the next regular session of the State Legislature.

HIGH POINTS IN A SUGGESTED PROGRAM

Some of the high points that would appear to be paramount in such a program are as follows:

1. Educating the public on general mental hygiene lines.

2. Suitable courses in mental hygiene be on the curriculum of certain schools and colleges in the state.

3. Identification of all mental defectives in the state.

4. Registration of all such cases in a given state department, which may or may not exist at present.

5. Supervision of all cases coming within this category.

6. The regulation of marriage in the mentally deficient, insane, and venereal disease cases.

7. Sterilization laws which will permit the operation to be done outside of institutions (bearing in mind that approximately 90 per cent of this misfit group is at large in the communities).

8. Birth control put into effect as was intended when approved by the United States Circuit Court of Appeals in November, 1936.

9. Have a special program covering the social control of the mentally deficient in the state, similar to that being done in South Dakota for the past five years.

10. Establish more special classes within the public schools or more special schools in the larger centers.

11. Establish better segregation in our state institutions for epileptics, defective delinquents, psychopaths, and psychotic children.

12. Construct a psychopathic hospital in the north and one in the south as clearing houses for all cases qualifying for such institutions, which will also give us teaching institutions for the medical colleges of the state, as has already been proposed and is being seriously considered and urged at this time.

13. That mental hygiene clinics be developed on a larger scale or in sufficient numbers to serve the state adequately.

IN CONCLUSION

In closing, I should like to recommend that a permanent state organization be developed at the earliest possible date to work up a detailed program to the extent that will render a decided service in every county and community within the state. Whether this organization be the official body to carry on the work afterward, or whether it be placed in one of the present state departments, like

the Department of Institutions, could be left up to the state-wide organization to decide.

It does seem, friends and coworkers, that with the great increase of mental cases each year, and the present state of our civilization, this mental field is being overlooked, and we should not postpone any longer trying to do more in the preventive field, if ever we expect to improve our race to the point where we can say our people in California surpass those of any other state or country.

CLINICAL EXPERIENCES AND EXPERIMENTS WITH PROTAMIN-ZINC INSULIN: THE POTENTIAL DANGER OF HYPOGLYCEMIA*†

By James W. Sherrill, M.D.
La Jolla

Discussion *by Howard F. West, M. D., Los Angeles; H. Clare Shepardson, M. D., San Francisco; F. M. Pottenger, Jr., M. D., Monrovia.*

FROM the time of the discovery of insulin by Banting, clinicians have recognized the importance of a modified form of insulin which possessed more permanent and lasting qualities. With this idea in mind many experiments have been carried out, employing various retarding processes such as oil suspension, emulsion, gelatin implants, vasoconstrictor substances, etc. Although commercial insulin serves to bring about certain metabolic alterations in the diabetic individual which closely imitate the normal, these patients are still not entirely controlled from the strict physiological standpoint. In reality, with the rapid postprandial rises in blood sugar which occur in our thoroughly treated diabetic patients, we must admit that they are in an active diabetic state 25 to 50 per cent of the time, even though painstaking methods are employed.

PROTAMIN INSULINATE

It remained for Hagedorn and Jensen at the Steno Memorial Hospital in Copenhagen to offer an insulin compound which can be repeatedly introduced into the human organism and which is so slowly absorbed from the subcutaneous tissues that it more fully imitates the continuous secretion from the normal pancreas. Protamin insulinate, which they described, was obtained by combining an acid solution of insulin with a basic solution of protamin. The protamin which they used had not previously been described, and was obtained from the sperm of the rainbow trout-salmine iridus. Other monoprotamin and triprotamin compounds were tried, but proved to be unsatisfactory on account of their high solubility in the subcutaneous tissues.

ZINC ADDITION

Fisher and Scott found the protamin prepared from Pacific Cohoe salmon, spring salmon, and steelhead salmon as effective a retarding agent as the protamin prepared from rainbow trout. They demonstrated that the addition of a small amount of zinc prolonged the hypoglycemic effect of insulin solution to which protamin had been added. Fresh mixtures of insulin and protamin were not as effective from the hypoglycemic standpoint as those to which a small amount of zinc was added, and allowed to stand for forty hours. Scott and Fisher, at the Connaught Laboratories in Toronto, have experimented extensively with spermin derived from pancreas (and a preparation from thymus glands) as a suitable retarding agent. When combined with ordinary insulin, prolonged hypoglycemic effect was produced similar in nature to protamin. That spermin is a normal constituent of the pancreas was reported by Dudley, Rosenheim and Rosenheim in 1924. They also found that spermin occurred in commercial samples of insulin prepared by the picric-acid method; likewise, that the entire amount of spermin normally present in the pancreas could be recovered from the insulin fraction. The hypoglycemic effect of spermin-insulin compounds was prolonged when zinc was added.

The metal zinc plays an important part in the hypoglycemic action of insulin. Scott and Fisher have shown that with the addition of 0.1 per cent of zinc in the form of zinc chlorid to solutions of insulin the physiological action of insulin was greatly delayed. The blood sugars remained considerably below normal for ten hours or more. Other metals, such as cobalt, potassium, and copper, are not as effective. Zinc-insulin solutions are as effective in properly metabolizing sugar as regular insulin. Maxwell and Bischoff found that by adding basic ferric chlorid to insulin the blood sugars of rabbits and rats could be suppressed to very low levels—as long as eight hours or more. About 20 milligrams of zinc per kilogram are found in the normal pancreas of the bovine, irrespective of the age. The zinc and insulin content of the pancreas of fetal calves is exceedingly greater. Cobalt and nickel are not detected in the pancreas of either. Recently, Gray reported the results of eighteen diabetic patients of various ages treated with insulin tannate solutions over periods of a few days to two weeks. He used a preparation described by Bischoff and Maxwell, which utilized the principle of precipitating protein hormones. The relative insolubility of insulin tannate in the tissues afforded delayed absorption and prolonged liberation of free insulin. Bischoff reported active insulin compounds, using more complex protein precipitants than protamin, viz., histon. Diabetes was successfully controlled when the preparation was used alone or in conjunction with regular insulin. The blood sugar lowering effect and hypoglycemic prolongation were essentially the same as the protamin insulinate controls, using the Hagedorn-Jensen preparation.

LITERATURE ON PROTAMIN-ZINC INSULIN

Joslin and his group treated one hundred cases of diabetes with protamin insulinate up to May, 1936. He summarizes the present status of the new substance very succinctly. "With protamin

Read before the General Medicine Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2-6, 1937.

† References will be given in the reprints.

insulinate the fundamentals of treatment of diabetes are not changed, but the ideals of treatment are more nearly achieved." He confirms the safety of its use, and that the diabetic can be controlled with greater ease. He encourages its use in mild as well as severe cases; the former because there may be the probability of one daily dose sufficing, and the latter because the omnipresent, high, fasting blood sugars can be greatly reduced. Multiplicity of doses in severe cases, likewise, can be reduced in some instances. Moller and Thomsen used protamin insulinate in ten cases with good results. Not only was less total insulin required, but the oscillations of the average diurnal blood-sugar curve was reduced. F. M. Allen calls attention to some of the difficulties arising in the use of protamin insulinate. In severe cases, characterized by labile and fluctuating blood sugars, he encountered the same difficulties in stabilizing the blood-sugar level with protamin insulinate as with the ordinary insulin. The milder the diabetes the easier the control; but in extremely severe cases rapid fluctuations between hyperglycemia and hypoglycemia were uncontrollable, just as has been encountered with the regular insulin in the past.

Protamin insulinate has been shown by Hanssen to be equally effective as regular insulin in its effect upon hepatomegaly, sometimes noted in diabetic children. The enlarged liver became reduced to normal size after several weeks of carefully controlled treatment. Of forty-two diabetic patients under twenty years of age treated by him at Steno Memorial Hospital in Copenhagen, twelve had enlargement of the liver in an uncontrolled state when admitted to the hospital. In five patients the lower border of the liver extended to the umbilicus. After varying periods of treatment with protamin insulinate, ranging from two to seventeen weeks, the liver edge became no longer palpable. Wilder and his associates were successful in controlling the glycemic level in diabetes of varying grades of severity and found they were able to reduce the number of daily injections. The immediate effect of protamin insulin was much less than regular insulin. The pyramiding or cumulative effect of the new insulin was noted. R. D. Lawrence, at King's College Hospital in London, found protamin-zinc insulin of distinct advantage in diabetic treatment and has given us one of the best theoretic discussions of its action to date. Henry J. John has had an exceptional experience in the management of a large series of diabetic children. He reports a reduction in the number of injections, as well as the total unitage, with more satisfactory regulation of the blood sugars throughout the day. Kerr and others confirmed the findings of Root and others that, following the administration of protamin insulin, the blood-sugar curve was not lowered so precipitously as with regular insulin, but sloped more gradually. Also they noted it was less likely to fall below the normal blood-sugar level and rose more slowly to hyperglycemic phases. Bowcock found distinct advantages in protamin insulinate over regular insulin. More perfect regulation of the daily blood-sugar levels was the rule; and insulin reactions fewer and slower in onset.

ADVANTAGES OF PROTAMIN-ZINC INSULINATE

Since November, 1935, at which time we were fortunate in receiving a large supply of protamin insulin through the courtesy of Doctors Hagedorn and Jensen of Copenhagen, we have used various batches and types of insulin in more than one hundred cases of diabetes. Later the Eli Lilly Company furnished us with numerous batches, to which calcium and zinc had been added. We have found that protamin-zinc insulin is of great value in the clinical management of diabetes, and a distinct advance over the former insulin treatment. As a therapeutic agent it has earned a permanent position. The advantages of a more slowly absorbable insulin substance are evident. Not only will the average diabetic profit by the use of an improved insulin, but the advantages accruing to the moderately severe diabetic, with his rapidly fluctuating blood-sugar levels, are manifest. From the theoretic standpoint it may be predicted that, in future years, we will see fewer diabetic complications on the basis of a more stably balanced organism. The possibility of a fewer number of daily injections and the avoidance of insulin shocks will be welcomed by all diabetics.

Several investigators have brought up the question as to whether protamin insulin offers advantages over the regular type of insulin. It is true that many cases remain essentially sugar-free a good portion of the time for many years with regular insulin. It has been our experience that, although sugar freedom in such instances is maintained, there is considerable fluctuation of the blood sugars throughout the twenty-four-hour period, and it is this fluctuation which is more satisfactorily controlled with protamin. One disadvantage of protamin is the peculiar tendency to glycosuria, usually trivial, in the presence of normal blood sugar. This is especially true in the early part of treatment. Further investigation of this peculiar alteration in the renal threshold, whatever this term may imply, is worthy of investigation. The most distinct advantage of protamin over regular insulin is the complete sugar freedom which can be accomplished throughout the night when it is given for the evening injection. The slowly acting insulin exerts a steady downward influence on the blood sugar throughout the night, and the morning fasting blood sugars are low, with the patient aglycosuric. Unless the night doses are unnecessarily excessive, reactions during the night are practically absent. With the regular type of insulin the reverse is true: fasting blood sugars are universally high and the morning urine contains sugar, unless an inconvenient extra dose is instituted at midnight or thereafter.

Recently, we made observations on the reduction in the size of the liver following adequate control of diabetes. The changes which take place in the size, shape, volume, and texture of the liver are astonishing. In one instance the liver was extreme in size, four fingers' breadth below the costal margin, and of firm, unyielding texture. After ten

days of intensive treatment and reduction of the persistently high blood sugars to essentially normal values and complete control of glycosuria, the liver receded two and one-half inches and became soft and flabby, and on manual palpation gave the impression that it had become "deflated." The second instance was that of coexistence of hypertrophic cirrhosis and diabetes. After thorough control very appreciable reduction in the size and firmness of the liver was observed. These two observations encourage us in the belief that the physiological action of protamin-zinc insulin materially assists in instituting more normal metabolic processes in the diabetic organism.

UNSUCCESSFUL CONTROL OF DIABETES IN SOME INSTANCES AND DISADVANTAGES OF PROTAMIN-ZINC INSULIN

With the introduction of any new therapeutic agent there is apt to be a tendency toward overenthusiasm on the part of many investigators. In this country some of the early reports were premature, which encouraged the indiscriminate use of protamin, and sufficient attention was not called to the advisability of preliminary animal experimentation or to the possible dangers which might arise from so powerful an agent. The ease with which death can be produced in dogs, as reported in this paper, bears out this point. Deaths in human subjects have already been reported. The Danish investigators made careful and cautious experiments for two or three years before the first American article was cited. Krarup's excellent monograph, published in 1935, contained detailed reports and protocols of approximately one hundred cases.

Special warning should be given when protamin-zinc insulin is prescribed for an elderly individual with potential or actual coronary and cardiac disease. Diabetes in this group is usually mild and small doses of regular insulin have long been known to affect them greatly. It would be distinctly unwise to permit prolonged hypoglycemia in such cases. F. S. Modern and the writers called attention to the chronic heart pain and anginal attacks produced by prolonged hypoglycemia. It is not difficult to recognize the hazards which might accrue from the chronic hypoglycemia on protamin-zinc insulin, especially since the patient has little warning until the blood sugar has fallen to dangerous levels.

Allen has shown protamin-zinc insulin offers no advantages over regular insulin in severe diabetes. Bertnard Smith also encountered resistance and difficulty in regulating severe cases. In our early clinical experiments we discounted the value of protamin insulin and felt that the claims for it were somewhat overemphasized because we administered it to our severest cases. Its effectiveness is most apparent in mild cases.

One distinct disadvantage lies in its property to produce gain in body weight. Any substance which encourages obesity reduces tolerance in diabetes. We might picture the dilemma which arises when obesity results from protamin-zinc insulin in amounts necessary to adequately control diabetes on a stipulated minimum diet, as opposed to lack of control of diabetes under minimum amounts of protamin, which would not increase the body weight.

Protamin-zinc insulin does not reduce the number of daily injections. In our clinical experiments we devoted a great deal of time and effort in attempts to regulate moderately severe cases of diabetes with one dose of insulin daily. Eight cases were selected and kept in the Clinic under accurate observation for periods ranging from two to ten weeks. In spite of carefully supervised efforts, as well as diligent attention in arranging and administering the injection at various times of the day with reference to meals, we were wholly unsuccessful in standardizing any severely diabetic patient on a single daily dose. Accordingly, we gave up further attempts and have discouraged other inquiring patients in the belief or hope that one dose of insulin daily would suffice. It is only natural that the hope and aspiration of the long-treated diabetic is that any newly discovered preparation would automatically carry with it a lessened demand in the number of injections. Their immediate disappointment as to this feature is offset by their later discovery that protamin assists them in reducing the frequency of reactions, and in the ease with which they can maintain sugar freedom. Mildly diabetic patients may be controlled with one daily dose.

Protamin-zinc insulin offers no advantages in infections, and is not to be depended upon. We have used it in several instances in the presence of fever and found its action most irregular. We have used it successfully for several weeks in two cases of diabetes, with infected bunions, with complete healing and perfect control of the diabetes.

It is no criticism of protamin-zinc insulin that it is not effective in coma or acidosis. The very nature of the substance and its slow availability should discourage dependence upon it when any real degree of acidosis is present. Joslin was successful in completely controlling acidosis in a young boy within twenty-four hours after the initial dose of protamin-zinc insulin. Ketonuria and glycosuria were later abolished entirely.

DURATION OF ACTION OF PROTAMIN-ZINC INSULIN

There are many factors which determine the length of time when the blood sugar remains depressed, chief among which are: the nutritional state of the patient, the thoroughness of the preceding dietary control, and the status of the patient's tolerance. In these regards protamin-zinc insulin does not differ from the regular insulin. In a few instances we have observed an effect as long as thirty-six hours in thin, well-controlled diabetics, while receiving rather low diets; approximating 1,200 to 1,400 calories. From the clinical standpoint, the usual dosage is effective for twelve to sixteen hours under average circumstances. Obesity in the diabetic shortens the period of effectiveness. It has been our experience that the duration of action of protamin-zinc insulin in dogs is more irregular than in man. We have observed

profound continuous hypoglycemia as low as 20 to 30 milligrams per 100 cubic centimeters for periods of thirty-six to forty-eight hours in fasting animals, and, on the other hand, we have observed quick rises in blood sugars in the same animals from similar hypoglycemic levels to normal values at the end of six to eight hours. Protamin insulin, when injected intravenously, gives a response essentially identical with ordinary insulin: the blood sugars fall just as promptly and return just as quickly. The failure to produce delayed reaction when injected intravenously is evidence that the prolonged activity which follows subcutaneous injection depends upon the slow conversion and absorption of the particular suspension in the body tissue fluids.

ARRANGEMENT OF DOSAGE—EFFECT IN COMBINATION WITH REGULAR INSULIN

With two types of insulin at our disposal there is an unlimited number of possible combinations and variations as to the time at which injections might be given. After much experimenting the most satisfactory results were obtained by giving a dose of regular insulin thirty to forty-five minutes before breakfast and protamin thirty minutes before the evening meal. Hagedorn and Jensen recommended this procedure as offering the most effectual management. When the action of the two types of insulin is analyzed, the reasons for selecting this procedure is apparent. Protamin, when injected before the evening meal, is successful in carrying the patient through the night with low blood-sugar levels. Its effect is still in evidence at the time of the breakfast and noon meals, and usually later the following day. The addition of quick-acting insulin before breakfast is then sufficient to take care of sudden elevations in blood sugar which arise from the free, available carbohydrate of the breakfast and noon meals. With this method the combined effect of the two insulins continues to exert an influence until the protamin is administered again the following evening. In properly controlled cases, it is not uncommon to encounter reactions at 4 or 5 p. m., in which event we have made satisfactory adjustment by delaying the protamin until thirty or forty minutes following the evening meal.

After our unsuccessful attempts with a single daily dose, we next tried the procedure of giving both types of insulin before breakfast, each injected separately, but we abandoned this method. The combined materials caused severe reactions about noon on account of the overlapping effect, and the lasting effect of protamin did not persist until the following morning.

We administered the regular insulin before the evening meal and protamin before breakfast in six cases, but without success. Severe reactions occurred from 8 to 10 p. m. on account of the combined action of the two insulins, and glycosuria appeared all too frequently during the day because the slowly acting protamin was not sufficiently responsive to offset the effect of the morning and noon meals. We have used protamin both morning and night in several severe diabetics with splendid results.

For patients who previously were under control with regular insulin, protamin insulin substitution can be made promptly without affecting the patient's clinical course, except that there may be a tendency to glycosuria the first few days until the delayed effectiveness of the new material evidences itself. We have found it satisfactory to substitute the usual night dose of regular insulin with the same number of units of protamin in well-controlled cases. A 10 per cent increase for the first three or four days often offsets the temporary glycosuria noted.

Rarely is it necessary or practical to give more than two doses of insulin daily whether protamin or a combination of the two insulins. The total insulin unitage is less when protamin is used.

SELECTION AND ARRANGEMENT OF THE DIET FOR THE DIABETIC

Protamin insulin has not changed materially the character of the diets which we formerly employed, except that in well-controlled cases we have been able to increase the total carbohydrate. A much wider latitude is permitted in the selection of higher carbohydrate foods. It is not the purpose of this paper to discuss the relative merits of high carbohydrate or high-fat diets as recommended by various authorities. We have continued to employ relatively low calory diets with carbohydrate allowances as liberal as the patient's tolerance will permit; usually twice as much carbohydrate as fat. High-fat diets are not to be countenanced. Theoretically, the use of a liberal amount of fat or a high-fat diet to produce a more sustained action in the blood sugar would be favorably indicated by reason of the slowly acting protamin-zinc insulin. In any event we should be cautious in advising more than 100 grams of fat in any diet. The insulin requirement, just as in the past, is proportional to the caloric value of the diet, as well as with the carbohydrate allotment. Higher insulin requirements prevail in the obese patients, in which instances we have employed low calory, low-fat diets to bring about reduction of body weight and better diabetic control.

The distribution of the food between the various meals of the day is important. We prefer to distribute the food more or less equally among the morning, noon, and evening meals; except that the total food value of the breakfast may be slightly less than the remaining meals if the patient so elects. If the regular type of insulin is employed for the morning dose, it may be unwise to permit a reduction in the breakfast, otherwise reactions may occur before the noon meal, irrespective of the kind of insulin or the dosage. We have not been successful in the suggested practice of giving a light evening meal on the basis that the evening dose of slowly acting protamin insulin would permit glycosuria in the early part of the night. Also, we have not found it necessary to shift the meals to earlier or later hours.

TABLE 1.—*Protocol of one of six experiments which we have conducted in dogs, showing the danger which follows prolonged hypoglycemia. Death has occurred in each instance if the blood sugar remains depressed for any appreciable length of time. The animals die in spite of restoration of the blood sugar to preliminary levels, and in spite of adequate water and carbohydrate administration. As to whether this phenomenon is confined to the canine species is not known.*

CHARACTER OF HYPOGLYCEMIC REACTIONS

The symptomatic as well as the objective manifestations of hypoglycemia with protamin-zinc insulin are distinctly different from those noted when regular insulin is used. Reactions occur with less ease and frequency, and by the same token persist longer and are more difficult to overcome. After a brief period of experience patients soon recognize the new prodromes of reaction which they can quickly offset. They are given a longer period of warning. One of the most striking features we have noted is that patients may be entirely oblivious to existing low blood-sugar levels for many hours, and are not disturbed in the slightest. It is not uncommon to note hypoglycemia of .050 per cent without evidences of reaction. The reason for this peculiarity is explainable on the basis that there is a known relationship between the rate of the fall of blood sugar and the suddenness of reaction. With quick-acting insulin the sudden reduction of the blood sugar from precipitous heights to lower levels, approximately .070 per cent, is followed immediately by the well-known symptoms of sweating, tremor, palpitation, etc. Such symptoms have been attributed to the sudden protective mobilization of adrenalin. With protamin-zinc insulin the blood-sugar level is so slowly and gradually reduced that the buffering response of adrenalin is not called upon, and the usual vasomotor reactions are not experienced. In 1933, Jordan called our attention to the neurologic manifestations which may accompany hypoglycemia in diabetic patients. He recorded no less than fifty signs and symptoms in proved instances ranging from sweating and tachycardia to epileptiform seizures and transitory hemiplegias. Peculiarly, all of the manifestations are related to the nervous system. With protamin-zinc insulin a different symptom-complex is noted. The most common complaints are drowsiness, vague, mental confusion, lassitude, and hunger. Sweating, palpitation, and tremor are rare. We have observed many patients to lapse into complete stupor and unconsciousness as the first symptoms.

Following the onset of hypoglycemia, particularly of any severity, liberal amounts of carbohydrate must be administered, and due care and caution must be exercised unless the patient may relapse again. In a few instances the reactions have been so persistent that three or four successive doses of carbohydrate have been required within an hour's time to return the blood sugar to a permanent normal level. With the regular type of insulin the administration of one carbohydrate feeding was usually sufficient to counteract the freely circulating insulin. With protamin-zinc insulin, however, it is to be remembered that the insoluble insulin compound remains stored in the subcutaneous tissues as a reservoir and continues to be released into the body fluids and blood stream. Muscular exercise increases the patient's susceptibility to reactions.

POTENTIAL DANGERS ASSOCIATED WITH HYPOGLYCEMIA

Insulin reactions are apt to be more frequent when commencing therapy with protamin-zinc insulin, and when they occur later are more severe than with ordinary insulin. The possibility of the use of excessive doses of this new slower-acting compound by untrained individuals, because of the lack of immediate results or the accidental administration of the concentrated precipitate from a vial which has not been agitated, make a knowledge of the effects of hypoglycemia due to insulin shock

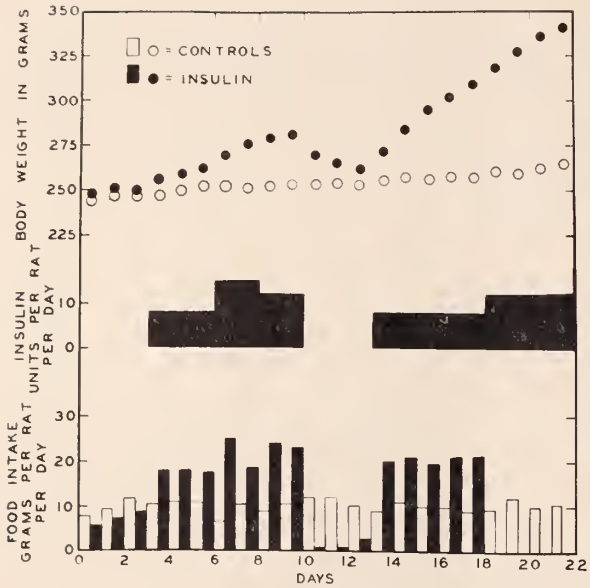

Fig. 1.—Composite curves of the body weight changes young adult rats, following the administration of protamin-zinc insulin. These experiments are being conducted by Doctors MacKay and Callaway. Note the increase in body weight on the fourth to the tenth and fourteenth to twenty-second days, inclusive, while receiving protamin-zinc insulin. The food intake was practically that of the controls. Note the sudden fall in weight when the insulin was stopped during the eleventh to thirteenth days, inclusive. The caloric intake on these three days was trivial.

Fig. 2.—In the above illustration the effect of hyperalimentation, following the use of protamin-zinc insulin for sixteen days, is well shown. These experiments are being conducted by Doctors MacKay and Callaway. Six young adult litter mates were used. Each of the rats on the right received 8 to 12 units daily. Food was furnished ad lib to controls and subjects. The average weight of the controls rose from 238 to 262 grams, while the insulin subjects increased from 242 to 344 grams. The locomotion of the fattened group was seriously interfered with.

essential. Attention is called to the recent work of Sherrill and MacKay, in which normal dogs die following prolonged hypoglycemia from a single or several injections of protamin-zinc insulin. (Table 1.) Heretofore it has been generally assumed and recognized that the hypoglycemia resulting from the use of regular insulin has proved entirely harmless if the blood sugar is returned to normal by the administration of carbohydrate or other food. No deleterious, residual injuries have been noted in man or animals. We have found that when fasted dogs are kept in hypoglycemic shock with occasional convulsions for twenty-four hours or more, some organic change is induced which prevents recovery and results in death, even though the blood-sugar level is restored to normal and the fluid balance is adequate. We have used six normal dogs for experiments and death has resulted in each instance. As a rule we have given a single injection of approximately one-half unit of protamin insulin per pound of body weight. Subsequent smaller doses may be required to produce prolonged hypoglycemia. These dogs have been kept in stuporous or comatose condition with blood-sugar concentration ranging from 20 to 30 milligrams per 100 cubic centimeters for twenty-four to forty-eight hours. Carbohydrate was then administered either intravenously or by stomach tube, and the blood-sugar concentration raised to normal until death ensued. None of the animals regained consciousness. Some tissue or organ is apparently so damaged by the hypoglycemia or related reduction in glycogen content, that death ensues, probably due to failure of the vascular system. No gross pathological lesions in the visceral organs or brain have been noted. Further experiments are in progress to determine the mechanism of this deleterious effect of insulin shock and the minimum duration of hypoglycemia which is dangerous.

As to whether the pathological lesions or chemical alterations which cause death in the dog are similar to and can be reduplicated in man, is open to question. Nevertheless, admonition at this time is expedient. In view of the various clinical applications to which insulin is being subjected in recent years, referring particularly to the work of Sakel, in which prolonged hypoglycemia is advocated in the treatment of schizophrenia, it may be that contradistinction must be made between regular insulin and protamin insulin. Authentic deaths have been reported in the past following the use of regular insulin, but only in extreme instances, and protamin may be no exception in this regard. Although the above animal experiments are convincing, hasty, adverse conclusions should not be arrived upon, which might deprive the diabetic patient of the benefits which may accrue from protamin insulin.

PROTAMIN-ZINC INSULIN AND FAT METABOLISM

Ordinary insulin has been used for a number of years to aid undernourished, nondiabetic individuals to gain weight. Pitfield, an American pediatrician, in 1923 first suggested its use in nondiabetic infantile inanition. It has been used in the management of pulmonary tuberculosis as a means of improving the nutritional state. As with many such clinical observations, it has never been clear that the insulin itself, and not one of the supplementary measures, was responsible for stimulation of the appetite in successful cases. Experiments with normal animals have always given negative results. In experiments, which are being conducted by Doctors MacKay and Callaway at this clinic, they have found that protamin-zinc insulin, in contradistinction to the ordinary product, produces a startling increase in the food intake and body weight of normal rats (Figure 1). The voracious-

ness with which they devour food and the rapidity with which fat is deposited throughout the whole body structures is astonishing. Figure 2 shows this remarkable hyperalimentation. The effect is produced by protamin-zinc insulin in doses of thirty or more units per kilogram body weight twice a day. It is proportional to the dose of insulin and presumably the degree of decrease in the blood-sugar level. When the insulin administration is stopped, there is a compensatory decrease in food intake, for they were already of normal weight when the weight gain started. Their growth rate is not influenced. This suggests that whatever good results ordinary insulin may have in human undernutrition, the protamin compound should prove much better. We have used protamin insulin in several patients with chronic undernutrition with considerable success. The immediate hunger which occurs with the onset of hypoglycemia in the beginning is very striking. Gain in weight occurs promptly. For some unexplainable reason subsequent hypoglycemia fails to produce hunger as effectively, and patients seem to establish a tolerance or resistance to the hunger mechanism. Nevertheless, if the dosage is kept sufficiently high, results are obtained. It is necessary and important to insist upon doses sufficiently large to lower the blood sugar to levels at which hunger might be expected, viz., 70 milligrams per 100 cubic centimeters or less. The character of the food used to offset hypoglycemia is important. We have found that the weight and nutrition is improved faster if the more complex forms of carbohydrate are used, such as bread, rather than candy, sugar, etc. When treatment is continued for several weeks, patients complain that their taste and appreciation of food tends to diminish. The use of protamin insulin in many clinical disorders in which the nutrition is poor deserves consideration. From our limited clinical experience thus far, it appears that protamin insulin is specific in producing hunger. This is not true of the regular insulin previously used, since various manifestations, such as sweating, faintness, or collapse, commonly appeared as the first indication of hypoglycemia, and in a large percentage of cases hunger was never experienced. Hypoglycemia alone does not account for the peculiarly rapid process by which the excessive adipose tissue is deposited. Protamin insulin induces some alteration in the fat metabolism whereby the rapid storage is induced.

Scripps Metabolic Clinic.

DISCUSSION

Howard F. West, M. D. (1930 Wilshire Boulevard, Los Angeles).—It is too early to be dogmatic in a discussion of the application of protamin insulin to the clinical treatment of diabetes. At this date one can give only impressions gained from a relatively short period of observation with the preparation as finally modified.

In an experience with approximately three hundred patients, my associates and I have arrived at certain tentative conclusions. While in the main we are in agreement with the observations presented by Doctor Sherrill in his paper, certain points relative to the use and action of this drug seem worthy of emphasis. The prolonged duration of its effect will prove of great benefit to many patients. The rapidly fluctuating blood sugar levels of many individuals using the original insulin has been a serious clinical problem throughout its period of use. This has applied especially to the so-called insulin-sensitive group, with whom compromises have had to be made between periods of glycosuria, hypoglycemic reactions and multiple dosage. To this group, especially, the more slowly acting preparation is proving to be of the greatest value, and a definite improvement can be noted in those of this group who have had sufficient time to make proper adjustment.

Individual adjustment of dosage and time are of paramount importance in the establishment of optimum control. There seems to be considerable variation in the rate of absorption and the duration of the insulin effect in different patients. The technique of injection would appear to have an important bearing upon this point. The patients must be instructed to inject the insulin into the areolar tissues, well beneath the subpanicular fat, as local swelling is apt to occur, and solution and absorption are inefficient if the injection is made too near the surface of the skin. It is also of great importance to see that the site of the injection is constantly changed. The size of the dose would seem to have a bearing upon the absorption rate, absorption decreasing as the amount of injected fluid increases. A short period of observation with U-80 protamin insulin, released so far for clinical trial only, leads us to believe that much of the difficulty with larger doses may be overcome. With those patients who have moderately severe diabetes, and especially those who have been taking the old insulin for some time, considerable patience must be shown before good adjustment on protamin insulin is obtained. Weeks or even months may elapse before a finally satisfactory degree of control is obtained. This period of adjustment is of paramount importance, and has a definite bearing upon the problem of dosage.

Contrary to the opinion expressed by Doctor Sherrill, it has been found in our experience that a considerable number of these patients do eventually arrive at the point where a single daily dose is adequate. During the transition period we have found a combination of the old and new insulin, both doses being given separately in the morning, to be the most useful method. A relatively small dose of old insulin before breakfast controls the first period of the day, the more slowly acting protamin insulin taken usually after breakfast controlling the late afternoon and night. Only a very few of our patients receive two daily doses of the protamin preparation. Practically all of the milder cases, and those in which insulin has not been used previously, can be started on a single daily dose of protamin insulin, provided there are no complications such as infections or acidosis, and the total diet is kept at a conservative level. The duration of insulin effect for fully twenty-four hours has been repeatedly shown by many of our patients, manifested either by mild hypoglycemic reactions shortly before the following breakfast or by low-fasting blood sugars.

Contrary to popular opinion, hypoglycemic reactions after protamin insulin must be expected, and even more carefully avoided than those resulting from unmodified insulin. They are slower in onset, the symptoms are more insidious, they are more prolonged and occur at a much later period. Because of these characteristics they are apt to develop while the patient is asleep, and, since the familiar warning symptoms of palpitation, sweating, and tremor may not occur, the patient may not be awakened in time to prevent rather profound symptoms. That considerable danger may be attached to these reactions is illustrated by the experience of two patients admitted to my service at the Los Angeles County General Hospital.

One, a woman, forty-six years of age, with arteriosclerotic complications, was unconscious for five days. During this period she manifested indications of profound irritation of the cerebral cortex without paralysis or other definite localizing signs. Even after recovering consciousness, she remained mentally confused for two months. According to the history obtained from her physician, the reaction developed at about 2 a. m. following a morning dose of only twenty-seven units.

The second patient was an alcoholic who, during a debauch, was living alone in a hotel. His sister stated that, in spite of arguments to the contrary, he had insisted that insulin was necessary to completely utilize his alcohol even though no food was taken. He was found unconscious in his room and died a few minutes after reaching the hospital

by ambulance. The blood sugar on entry was 45 milligrams per cent. The brain was preserved for special study and the report is not yet available. There were no other definite findings at autopsy to explain the cause of death. It must be admitted that this death might just as well have been caused by the unmodified insulin if used in the same careless manner.

While this new preparation offers certain distinct advantages in the treatment of diabetes, much remains to be learned regarding its effects and its indications. Many patients may do equally well or even better with the old insulin. Experience has demonstrated that it must be used with great care.

*

H. Clare Shepardson, M. D. (384 Post Street, San Francisco).—Confidence in the effects of a new therapeutic agent is attained only after proper evaluation of the experiences of various investigators who have made exhaustive studies concerning the detailed actions of such an agent. Consequently, due cognizance should be taken of each article covering the use of protamin-zinc insulin.

Doctor Sherrill has given a concise report of his results with this material. Thorough analysis indicates his experiences parallel those of other workers, with certain rather minor exceptions.

At the University of California Out-Patient Department we have found a much greater benefit accruing to the severe diabetic, who by the use of long acting insulin is maintained under better control, than was possible using regular insulin. In our group of severe diabetics we have been able to reduce the daily dosage (units of insulin per day) of insulin 30 per cent, and the number of daily injections to two daily. Furthermore, the number of uncontrolled cases has been reduced 50 per cent. In no instance has it been necessary to give more than two injections of protamin-zinc insulin daily, and usually one dose of protamin-zinc insulin and one of regular insulin suffices to control the moderate-to-severe diabetic. This is the patient who formerly had to subject himself to oft-repeated injections of regular insulin to insure reasonable control of the disease.

We were unable to observe any essential change in the insulin dosage or degree of control in patients with mild diabetes, but it was possible, in this group, to reduce the number of daily injections by one-half, with the large majority taking only one injection daily. Also no appreciable lowering of the total daily dosage was possible in the group with moderately severe diabetes, but there was a reduction of 26 per cent in the number of daily injections. And the number of uncontrolled cases in this group was reduced to 25 per cent of the previous number.

There are many factors, of course, which influence the results obtained in various clinics. Thus the manner in which patients follow a prescribed routine, and the attention given in the explanation of details in therapy to the patient, can account for rather wide variations in the results obtained. It is our belief, however, that protamin-zinc insulin represents a decided step forward in diabetic therapeutics, and that the benefits obtained are in direct proportion to the severity of the diabetes.

*

F. M. Pottenger, Jr., M. D. (Pottenger Sanitarium, Monrovia).—Although protamin insulin apparently possesses certain drawbacks, I wish to speak of a class of patients who have both severe diabetes and tuberculosis, and who require not the 10 to 20 units of insulin a day, spoken of by Doctor Sherrill, but from 80 to 100 units and even 150 units or more to control their diabetes. In such patients we have been able to reduce the number of injections from 4 or 5, to 1 or 2 in twenty-four hours. We have also experienced a much better control of our diabetics than we formerly had. This particularly applies to the exacerbations of the diabetes which follow the exacerbations in tuberculosis so commonly experienced by these patients. Some of these patients using the ordinary insulin have been prone to have extremely high early morning, and extremely low afternoon blood sugars. A satisfactory control of these cases is very difficult to obtain; but by substituting protamin insulin for the ordinary insulin, exacerbations, both tuberculous and diabetic, tend to be less severe and more easily controlled. Protamin insulin apparently gives these patients a better tone to their heart muscles, as evidenced by the almost universal drop in the pulse of 10 to 20 beats.

In spite of the great advantages, however, there are some drawbacks which complicate the administration of protamin insulin. In one instance we have seen insulin remain in the tissues and form nodules; then, all of a sudden, the insulin was released, causing a prolonged hypoglycemia.

CREATINURIA OF CHILDHOOD*

WITH SPECIAL REFERENCE TO BONE AGE

By E. Kost Shelton, M.D.
AND
B. N. Tager, M.D.
Los Angeles

Discussion *by H. Lisser, M. D., San Francisco; Howard L. Eder, M. D., Santa Barbara; Willard E. Kay, M. D., San Francisco.*

CREATINURIA is normally present in childhood.[1] The absence of this phenomenon in cretinism and in childhood myxedema has recently been reported.[2,3] In such children the administration of thyroid causes a prompt appearance of creatin in the urine. Injection of the thyrotropic fraction of the anterior pituitary into animals with intact thyroid glands also enhances creatin excretion.[4] These observations are consistent with the augmentation of urinary creatin in adult hyperthyroidism, and of its diminution or suppression following restriction of thyroid function.[5,6]

Retardation of bone development in cretinism and in childhood myxedema is a well-established fact and one of proved value in differentiating such severe subthyroid states from other forms of mental defectiveness, mongolism, etc. In the less classical forms of hypothyroidism, marked retardation of bone development offers a valuable aid in diagnosis.[7,8] The response of these children to thyroid administration is too remarkable to be anything but specific. There remains a third and larger group, with moderately retarded bone age, who, although suffering from some disturbance of somatic development, present difficulties in diagnosis. The possibility of a borderline subthyroid state in a percentage of these children cannot always be excluded. However, other hormone influences, as well as nutritional, infectious, congenital or constitutional factors, undoubtedly contribute to the formation of this group. The present study was designed to throw more light on the indeterminate case.

DIVISION OF THE STUDY

The study was divided into two main parts:

1. An estimation of creatin excretion on admission in (*a*) clinically verified hypothyroid children with markedly retarded bone age; (*b*) in children with moderately retarded bone age in whom the thyroid status was unknown; (*c*) in children with normal bone development.

* From the Shelton Clinic, Los Angeles.

Read before the Pediatric Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

The expense of this investigation was defrayed by a fellowship from the St. Francis Foundation for Clinical Research, Santa Barbara.

TABLE 1.—*Averages of Duplicate Analysis of Creatin on Each of Two Successive Days*

Name	V. L.	A. C.	A. S.	H. J.	P. M.
First day	330 ±24	54 ± 9	142 ±36	16 ±12	150 ±10
Second day	193 ±20	118 ±40	57 ±30	20 ±30	70 ±30

2. An estimation of creatin excretion on admission, as compared with the creatin excretion following certain therapeutic regimens. In this last study the children were selected at random—that is, without reference to thyroid status or bone age. The therapeutic regimens were as follows: (*a*) Ten children were given U. S. P. desiccated thyroid† (uncoated) one-half grain daily, for three months. (*b*) Ten children were given Lugol's Solution, ten drops twice daily, for two weeks. (*c*) Eighteen children were given cod-liver oil and iron (one dram twice daily, total iron content, seven grains). (*d*) Nineteen children were given no medication, but received the basic well-balanced diet, sunshine, rest, and good nursing care common to all. The difference between admission and final creatinuria in the last group served as a control.

CLINICAL MATERIAL FOR THE STUDY

Studies were undertaken on fifty-six children between the ages of six and thirteen, all but four of whom were admitted to a preventorium during the past year for the purposes of physical betterment. The reasons for admission to the preventorium consisted of one or more of the following complaints: (1) Underweight. (2) Poor resistance to respiratory infections. (3) Contact with tuberculosis. Acute illness or active chronic illness was present in no instance. There were twenty-seven boys and twenty-nine girls. Bone age was unknown prior to admission, but was determined roentgenographically on entry, using the status of the carpal and elbow development as criteria. Bone retardation as here defined implies a delay in osseous development of two years or more, as compared with chronological age, according to the standards at our command.[9] The general agreement, in reading the roentgenograms (within one year) between the two most experienced observers, was gratifying.

All children were under observation for at least three months. A complete physical examination, blood count, urinalysis, Wassermann and tuberculin test were performed on entrance. Pulse and temperature readings were periodically recorded, and the presence of even a minor infection was considered an indication to postpone the collection of urine for study. Excellent nursing supervision was provided, assuring the complete collection of urine and the maintenance of standard environmental conditions. During periods of collection the children were restricted to bed rest, but were permitted to sit up in bed and play. A meat-free diet was maintained, although eggs and milk were permitted. In every instance, a preliminary day on the above regimen was observed before the urine collection was initiated.

† Supplied through the courtesy of Armour & Company.

METHOD

Creatin was determined by the method of Folin[10] and values expressed in terms of milligrams equivalent of creatinin excreted in twenty-four hours. Determinations were made at first in duplicate, but this practice was discontinued when it became evident that fluctuations from day to day appeared to exceed variations in duplicates of a single day. (See Tables 1 and 2). When more than one determination was made within a two-week period, the values were averaged and the single figure recorded in tables 3, 4 and 5. Two hundred determinations were made in all. The urine was also routinely examined microscopically and for sugar. A known solution of creatin (one gram per liter) was made and determined concomitantly with the unknowns to serve as a control on the accuracy of technique. In calculating the averages, probable error, and the significance of the deviation between the two averages, standard statistical methods were employed.[11,12]

RESULTS

Table 3 presents creatin values obtained on admission and following the various regimens, on all of the fifty-six children. Those presenting bone retardation, as here defined, are marked thus (*). Clinically verified hypothyroid cases (all of whom had severely retarded bone age) are marked thus (†). The sex is denoted. The ages between six and thirteen are fairly evenly distributed, but are not denoted because the number in each group is insufficient to be conclusive as regards the influence of the age factor. In both the normal children and those manifesting bone retardation, however, an increased creatinuria, with increase in age up to puberty, is suspected.

Table 4 presents the averages (values of urinary creatin on admission only) of each of the three groups in the first study, *i. e.*, those with clinically verified hypothyroidism and markedly retarded bone age; those with retarded bone development, whose thyroid status is unknown; and those considered normal as regards bone age. While sex was ultimately discovered to have little effect on the

level of creatin excretion (Table 5), girls, on the whole, excreting a little more than boys, it should be explained that all except the clinically verified hypothyroid children in this (first) study were male. The retarded boys excreted, on the whole, much more creatin than those in the normal or control group, the difference approaching statistical significance. In the verified hypothyroid group, girls were included because of the dearth of material. In spite of the sex trend, as previously stated, the average for this group is considerably below that for the normal, and that for the boys presenting bone retardation. The difference between these averages is statistically significant. In order to obviate confusion, it should be remembered that the clinically hypothyroid children all had severely retarded bone development, but are not here included or considered in the retarded bone-age

group. When all of the fifty-two (preventorium) children are considered, the same trend of increased creatin values may be seen by a shift of the curve of the retarded bone-age group to the right (Chart 1).

Table 5 summarizes the effect of therapy on creatinuria or the outcome of the second phase of this study. Some increase in creatin excretion appeared following cod-liver oil and thyroid. The magnitude of this increase is, however, not statistically significant, and falls within the same range as the increase in the control group under excellent hygienic care, but not subjected to medication. Therapy with Lugol's Solution, however, almost doubled the creatin excretion and is statistically significant.

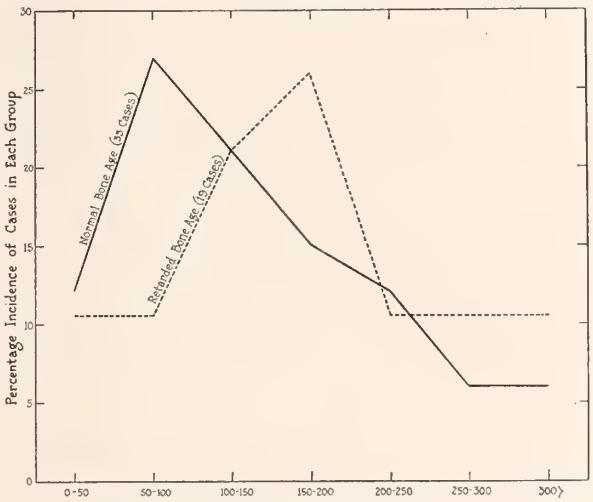

Chart 1.—Creatin excretion, milligrams, in twenty-four hours. Distribution curve of creative values for normal children and for children with retarded bone development.

COMMENT

Of fifty-two children (about equally divided as to sex), ranging in ages from six to thirteen, in whom creatin studies were carried out, nineteen (or 36.5 per cent) were found to be retarded two years or more in bone development. This figure is approximately 23 per cent higher than that observed by Shelton in 560 unselected public school children.[8] The difference is perhaps to be expected, since all of the fifty-two children were admitted to the preventorium for correction of underweight and other physical inadequacies. In this group, retardation of bone development was found to be four times more common in boys than in girls. This is in agreement with previous findings.

The finding of an increased creatinuria in children presenting bone retardation suggests that hypothyroidism is not the underlying factor, since in clinically verified hypothyroid children, also presenting bone retardation, diminished creatin excretion is discovered. Nor can one explain the increased creatinuria in the former on the basis that the retarded child is physiologically younger, since from this study the impression is gathered that younger children excrete less creatin than those approaching puberty. The difference apparently depends on a qualitative, rather than a quantitative factor. One may infer that the increased creatinuria, in the presence of bone retardation, is due to an inferior musculature, *i. e.,* a concept applied to muscle dystrophies and borne out by the fact that creatinuria is augmented in hyperthyroidism with increasing muscular weakness.[13-15] This concept may be permissible, since retarded skeletal development implies a poor musculature, and vice versa. Be that as it may, in the presence of a moderate degree of bone retardation and an indeterminate clinical picture, the finding of a diminished creatin excretion suggests that hypothyroidism may be the causative factor. Under such circumstances a prolonged therapeutic trial with thyroid is indicated. If, in a similar patient, the creatin excretion is discovered to be increased, it may be taken as evidence against the diagnosis of hypothyroidism. In all instances the spontaneous variability in creatin excretion from day to day cannot be stressed too strongly, and a number of creatin determinations on different days is recommended.

In the second part of the study, all forms of therapy led to some increase in creatinuria; yet the response to cod-liver oil and to thyroid appeared no greater than to a well-balanced diet, sunshine, and good nursing care without medication. In view of the observations of others, namely, that thyroid administration to cretin children results promptly in an increase in creatin excretion, the figures here presented may appear at variance. We feel, however, that the studies are not comparable. In the hands of others, thyroid administration led to prompt creatinuria in hypothyroid children. In this study our observations were not made promptly after the administration of thyroid, nor did our group of ten represent exclusively hypothyroid children. The six clinically verified hypothyroid children under observation did show a substan-

tial increase in creatin excretion following thyroid treatment.

CONCLUSIONS

1. In clinically verified hypothyroid children (all of whom presented severely retarded bone development) the finding of diminished creatinuria is confirmed.

2. In children presenting an indeterminate clinical picture (accompanied by retarded bone development) increased creatinuria was found.

3. Administration of iodin to children (unselected as regards thyroid status or bone development) caused a significant increase in creatinuria.*

DISCUSSION

H. Lisser, M.D. (384 Post Street, San Francisco).—Efforts to utilize sundry laboratory procedures to render more precise clinical diagnoses of endocrinopathies are commendable and desirable. In this connection it is hoped that researches now in progress, aiming to assay hormones quantitatively in blood or urine, etc., may eventually prove helpful in differential diagnoses of amenorrhea, infantilisms, virilisms, precocity syndromes, hypertensions and disturbances in calcium and carbohydrate metabolism.

Accordingly, Doctor Shelton deserves credit for this painstaking attempt to evaluate the significance of increased or decreased creatin excretion in dubious or borderline instances of childhood retardation. His results seem to indicate that the particular group of problem cases he studied could be excluded from a hypothyroid status by reason of increased rather than decreased creatinuria.

Doubtless, Doctor Shelton would not wish to give the impression that he considers a single laboratory test sufficient to establish a diagnosis; for example, one may encounter a diminished basal metabolic rate occasionally in hyperthyroidism, or a negative Wassermann in active syphilis. Nevertheless, negative or positive laboratory data, together with positive or negative symptoms and signs, constitute the foundations for the building of a diagnosis. Therefore, the more confusing and obscure a case may be the more elaborate the testings required to clarify the muddle.

No doubt others will wish to confirm and extend Doctor Shelton's studies of creatinuria of childhood, and many hundreds of cases must be checked before the true significance will be established. Premature enthusiasm for a new laboratory test must be avoided. Thus, the initial expectations of a reliable distinction between hypo- and hyperthyroidism, by determination of the blood cholesterol, was considerably exaggerated.

❦

Howard L. Eder, M.D. (Santa Barbara Clinic, Santa Barbara).—This work, as reported by Doctors Shelton and Tager, on creatinuria during childhood is of importance. We find certain children who are obviously not in a state of good nutrition, who show no definite laboratory findings on which to base diagnosis or treatment.

The majority of the cases reported in this paper were such children cared for in a preventorium under controlled conditions extremely suitable for study. This investigation showed that those children with retarded bone ages when given thyroid did not respond by an increase in the creatin output. The children did, however, show a considerable increase when given Lugol solution. We have made it a routine procedure to give all new admissions Lugol solutions. We have not decided whether these children are undernourished as a result of some endocrine disturbance caused by a retardation in osseous development, or whether the osseous retardation is a direct result of prolonged poor nutrition from causes other than endocrine deficiency. We have been able, by carrying out a careful regimen, to obtain an average gain in weight of twelve and one-half pounds per child in a period of four months in the preventorium. We have also followed a high per cent of these children after their discharge and found them to continue to gain weight and remain in a state of good nutrition. All children receive seven grains of iron carbonate in an emulsion of cod-liver oil as long as they remain in the preventorium, and they continue its use after they return to their homes. Many of these children, because of clinical evidence or retardation of osseous development, are put on thyroid medication.

This study, as reported by Doctors Shelton and Tager, has been of value to us. I am sure that the importance of creatin output in this type of child is of more significance than can be stated at this time.

❦

Willard E. Kay, M.D. (2000 Van Ness Avenue, San Francisco).—This contribution of Doctors Shelton and Tager clarifies very considerably the handling and therapeusis of this rather large group of children showing moderate bone retardation. Many of them are undernourished, underdeveloped, susceptible to infection, and are allergic. Frequently, signs and symptoms of hypothyroidism associated with a colloid goiter or thickening of the gland and a hypertonic vegetative nervous system with vagotonia and a slow pulse, etc., confuse the picture. The finding radiographically of retarded bone age fits in well with the clinical impression and wish fulfillment that at last we have found the treatment for these deficient individuals, and so exhibit thyroid extract in every form and dosage over prolonged periods. Its failure to help is not only a great disappointment to ourselves but to the parents who, through our enthusiasm, have become too hopeful. In some instances the children are made worse, become more nervous and irritable, and lose weight. We wonder why we have not obtained better results. Since we know a basal metabolism is unreliable and a blood cholesterol likewise, the latter only revealing the more pronounced hypothyroid states when the determination of the bone age is an easier and more reliable aid in diagnosis, this finding of Doctors

* The authors wish to acknowledge the kindly coöperation of Dr. Howard Eder, Medical Director, Miss Cass, Supervisor, and the staff of Sunshine Cottage, Santa Barbara.

Shelton and Tager now gives us a valuable diagnostic aid and marks a definite advancement in our understanding of these cases.

Only within the past few years has the measurement of creatin in the urine been of much clinical significance endocrinologically. Hess (Hess, J. H., Ann. Int. Med., 8:607, 1934) shows that creatinuria is a very delicate index of the effect of thyroid administration, that there is a diminution or complete absence of physiological creatinuria in hypothyroidism, and that thyroid restores it to the normal content; that creatinuria is restored even before changes in body weight, blood cholesterol and basal metabolism are to be noted. Previously, blood creatin and creatinin and urinary creatinuria were chiefly studied from the standpoint of the myopathies, notably the muscular dystrophies. When Janney and his coworkers, in 1918, found an abnormal presence of creatin in the urine (Janney, N. W., Goodhart, S. P., and Isaacson, V. I., "The Endocrine Origin of Muscular Dystrophy," Arch. Int. Med., 211:188, February, 1918), they then noted a polyglandular involvement in which the thyroid, hypophysis, gonads, pineal, and adrenals participated. In 1921 Brock and I (Brock, S., and Kay, W. E., "A Study of Unusual Endocrine Disturbances," Arch. Int. Med., Vol. 27, pp. 1-37, January, 1921), reported our findings in young adults of service age, of the blood and urine creatin in myopathies associated with unusual endocrine disturbances. We did not find anything significant. Recently, in 1936, P. Kahn and N. Smith (Arch. Dis. Child., 11:307-310, December, 1936) feel from their studies that when the gonads are not properly functioning creatinuria appears. Children have creatinuria until puberty. Further, they state that old people have small amounts of creatin, that eunuchoids have constant creatinuria, and that pituitary obesity and hypogenitalism are accompanied with creatinuria. They go on to show that muscle dystrophy or immature muscle mass does not account for it. I should like to ask Doctors Shelton and Tager whether or not the finding of an increased creatinuria in these children might be significant from their point of view?

ROENTGEN-RAY PELVIMETRY*

A STUDY OF THREE HUNDRED TWENTY LABORS

By CHARLES THOMAS HAYDEN, M.D.
San Francisco

DISCUSSION *by Alice F. Maxwell, M. D., San Francisco; D. G. Morton, M. D., San Francisco; John N. Ewer, M. D., Oakland.*

AT the University of California Hospital, routine roentgen-ray studies have been made on all primiparous women for the past four years.

Three exposures were taken: (1) The diameter and configuration of the superior strait were obtained by the Thoms grid method. (2) A lateral film, with the patient in a standing position so that the femurs were superimposed one upon the other, and the Thoms grid plate again used. (3) The subpubic angle was demonstrated by methods proposed by Pettit, Garland, Dunn, and Shumaker.

CLASSIFICATION OF THE FEMALE PELVIS

These films furnished us with material for study with regard to the pelvis, from the standpoint of actual measurements of the superior strait, and at the same time afforded us an opportunity to study the salient characteristics shown by Caldwell and Moloy in their classification of the female pelvis.

The classification is based upon the following factors:

1. The size of the posterior segment of the superior strait.
2. The size of the anterior segment of the superior strait.
3. The degree of the retropubic angle.
4. The width of the greater sciatic notch.
5. The size and shape of the ischial spines.
6. The lateral bore (relationship of the anterior and posterior surfaces of bony birth canal).
7. The width of the subpubic angle.
8. The splay (relationship of the lateral pelvic walls).

FOUR MAIN TYPES

Upon this basis, the four main types of female pelves are distinguished:

1. In the gynecoid type of pelvis, there is a wide posterior segment to the superior strait, wide anterior segment with obtuse retropubic angle, wide greater sciatic notch, average ischial spines, parallel lateral bore, average or wide subpubic angle, and parallel splay.

2. In the android type, there is a narrow posterior segment to the superior strait, anterior segment with acute retropubic angle, narrow greater sciatic notch, prominent sharp ischial spines, converging lateral bore, narrow subpubic angle, and converging splay.

3. In the anthropoid type, the pelvic inlet is greater in its anteroposterior diameter than its transverse diameter, with a resultant wide posterior segment, an anterior segment which is apt to have a slightly acute retropubic angle, extremely wide greater sciatic notch, blunt ischial spines, a lateral bore which is divergent, average or slightly narrowed subpubic angle (often associated with a deep type of pelvis), and either parallel or slightly convergent splay.

4. In the platypelloid type, the pelvic inlet is shortened in its anteroposterior diameter and lengthened in its transverse diameter with a variation of three centimeters or more. This type has a wide retropubic angle, average greater sciatic notch, average spines, inclined to have a divergent type of bore, average subpubic angle and divergent splay.

There are numerous combinations of the above types which account for the subgroups of the classification, as advocated by Caldwell and Moloy, and which constituted 25 per cent of our cases.

AUTHOR'S GROUPING

In a series of consecutive pelves studied, we found the following groups, which we have compared with the series reported by Caldwell and Moloy (215 cases), and the series of one hundred cases reported by Pettit, Gardland, Dunn, and Shumaker.

It is clearly seen that these figures compare for the most part with only minor variations, which are probably due to the differences in clinical material as observed in cross section of any district or section of the country.

In a recent report by Thoms, it is observed that he also found an incidence of anthropoid pelves,

* This study made possible, in part, by grant from the Christine Breon Fund for Medical Research, University of California Medical School.

Read before the Obstetrics and Gynecology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

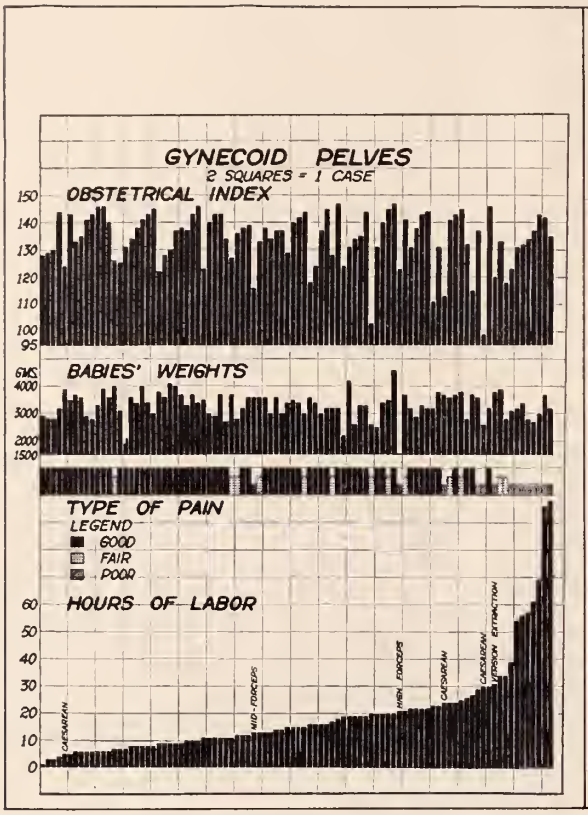

Chart 1.

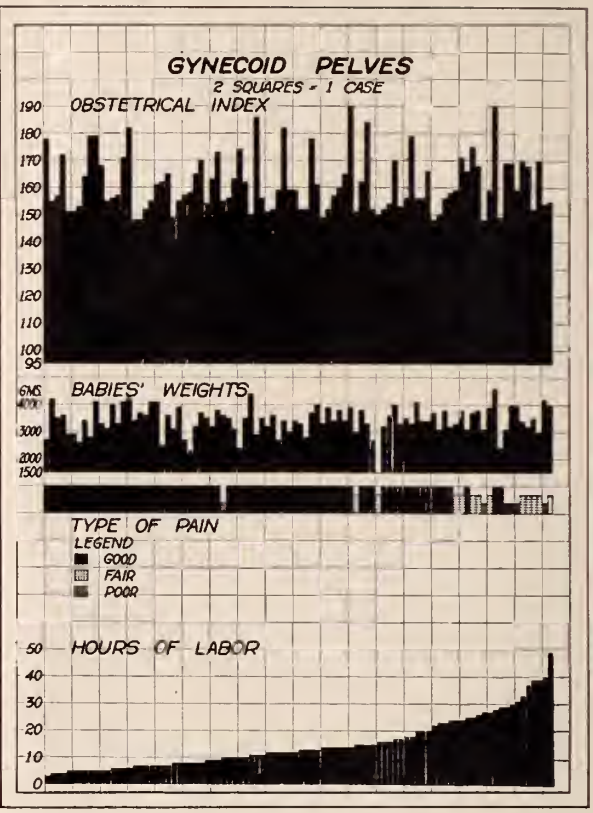

Chart 2.

16 per cent, and platypelloid pelves, 3.3 per cent; while the remainder of his three hundred cases of primiparous white women cannot be directly compared with the above table because of the differences in his classification.

Many investigators and students of the pelvis have conclusively proved the fallacies of external pelvic measurements as a true index of available space along the bony birth canal, and have shown the advantages of roentgen-ray for this purpose in

live women, and its practical aid in the prediction of possible operative interference.

A STUDY OF THREE HUNDRED AND TWENTY PRIMIPAROUS CONSECUTIVE LABORS

Three hundred and twenty primiparous consecutive labors delivered in our hospital were investigated, upon whom roentgen-ray films had been taken during their prenatal course.

In this group as a whole (320), operative interference occurred, as shown in the following table:

In the reports of most investigators, the average length of labor has been given for each group; but in our experience this average is not a true index as to what to expect, as there is a wide variation in the number of hours of labor in all groups of pelves, depending upon the type and character of pains. This fact is particularly emphasized when one classifies pelves according to type and compares the duration of labor to the type of pains, size of baby, and relative size of the pelvis. For graphic purposes the obstetric index, as described by Ewer and Bowen, was employed to represent the relative size of pelvis. This index is equal to the product of anteroposterior and transverse diameters. For convenience, we have taken as small pelves those having an index of 135 or less; average size pelves, 135 to 160; and large pelves, 160 to 200.

COMMENT ON PLATES

Plate 1.—In Plate 1 will be found half of the gynecoid group with obstetric indices ranging from 99 to 147, inclusive. There are ninety-two such cases in which labors varied in length from one to

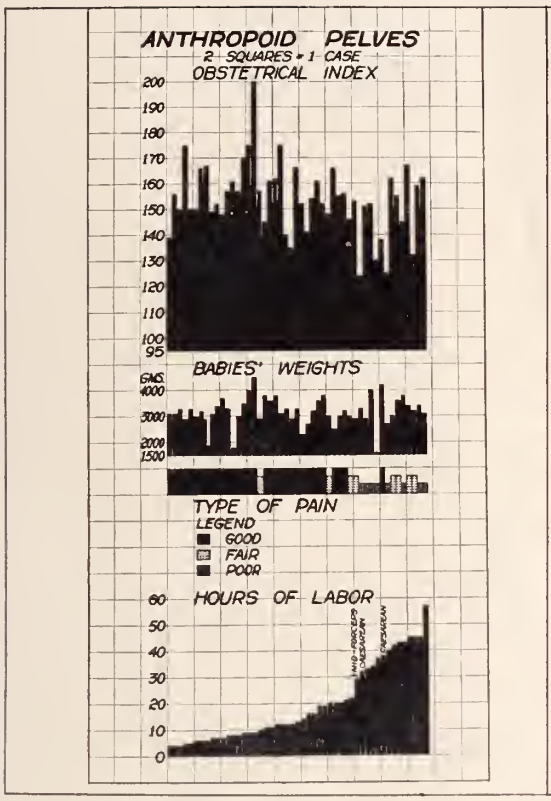

Chart 3.

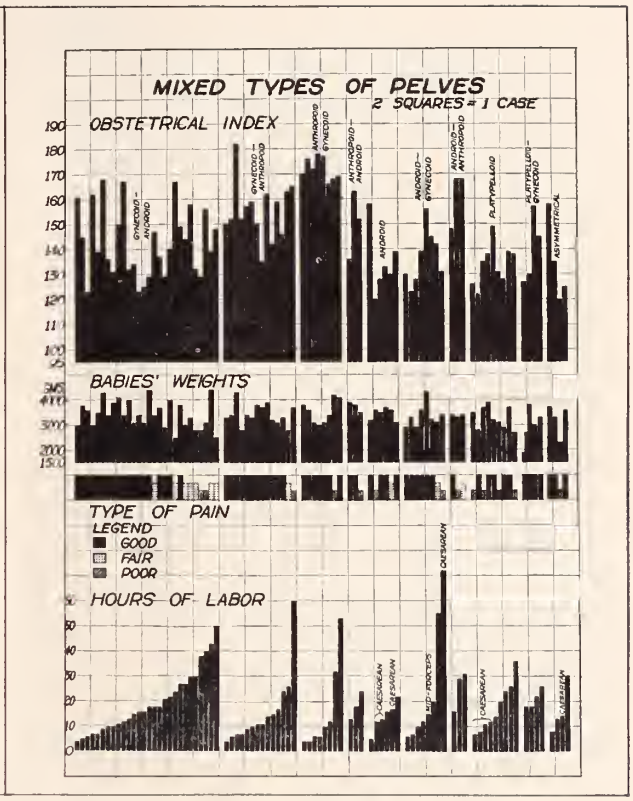

Chart 4.

ninety-eight hours. The long labors throughout are characterized by poor pains, with some definite dilatation of the cervix, but actually representing patients in and out of labor for the duration of time represented in the charts. As compared with the average eighteen-hour labor in this group, 55 per cent had labors of eighteen hours or less, while 45 per cent had labors greater than eighteen hours in duration.

The weight of the babies varied from 2200 to 4600 grams, but for the most part were average. There was one set of twins in this group, babies weighing 1900 and 2100 grams, respectively.

Cesarean section was the method of delivery after trial labor in three instances, one mid-forceps, one high forceps, followed by craniotomy, and one version extraction.

The first cesarean section was performed after five hours' trial labor with good pains and an unengaged head with ruptured membranes. This patient's obstetric index was 124, and she had a 3900-gram baby, which was relatively large. The second cesarean section was necessary in a patient after twenty-four hours of ineffectual pains, with a 3700-gram baby, and a small pelvis with an obstetric index of 113. The third was in a patient after thirty hours' trial labor with poor pains, small baby, 2600 grams and an extremely small pelvis, having an obstetric index of only 99.

In contrast to these three examples there were several small pelves with small obstetric indices that delivered, spontaneously, average-sized babies in less than thirty hours, but their labors were characterized by effective pains as judged by frequency and duration.

Case 1, *Plate 1*.—Case 1, in Plate 1, was a patient with a small pelvis (obstetric index 128), who had a 2900-gram baby in one hour, with very severe pains. She entered the ward at the onset of labor with a few irregular pains, unruptured membranes, a floating head, and undilated cervix. Pains soon became very severe in frequency and duration, and a small baby that died from intracranial hemorrhage was delivered. A second fetal death in the series occurred when a high forceps was attempted and failed, due to a parietal presentation. A craniotomy was necessary to terminate the labor. This labor was characterized by ineffectual pains in a patient with an obstetric index of 123.

The labor in one case, with poor pains, was terminated by a mid-forceps, after full dilatation without advance. This patient's pelvis had an obstetric index of only 116, while her baby was of average size, weighing 3600 grams.

The version extraction was the method of choice in one case, after failure in an attempted mid-forceps to terminate labor in a woman with an obstetric index of 120, after thirty-one hours of

Table 2.—*Operation Statistics*

	Cases	Per Cent
Cesarean section	16	5

Mid-forceps	4	1
High forceps, with craniotomy	1	.3
Version extraction	1	.3

labor with ineffectual pains, and full dilatation without advance. This patient's baby weighed 3800 grams.

Plate 2.—In Plate 2 will be observed the average and large gynecoid pelves. There are also ninety-two cases in this group. The most striking feature again is the wide variation in duration of labor, dependent upon the character of the pains. The shortest labors were four hours in duration, while the longest lasted forty-nine hours. Seventy-three per cent of the labors in this group were eighteen hours or less, while 27 per cent were over eighteen hours in duration. In this series, no operative procedures were necessary. The babies were of average size, varying between 2300 and 4600 grams. There was one stillbirth in a child with hydrocephalus and associated spina bifida.

Plate 3.—Plate 3 represents the labors, types of pains, size of babies, and obstetric indices in forty-nine cases with anthropoid pelves. Again, the duration of labor has varied, dependent upon the character of the patient's pains. Fifty-seven per cent had labors of eighteen hours or less, while 43 per cent had labors greater than eighteen hours. The longest labor was fifty-seven hours. The weight of the babies again represented, for the most part, average-sized infants. The smallest was 1800 grams, and the largest 4500 grams. There was one set of twins, weighing 1900 and 2900 grams, respectively.

It was necessary to resort to operative measures in four cases, two mid-forceps and two cesarean sections.

The mid-forceps were done in two patients with only fair pains, after twenty-two and twenty-nine hours of labor with uterine inertia after full dilatation. One cesarean section was in a patient after thirty-three hours' trial labor with ineffectual pains, unengaged head, 3300-gram baby and an obstetrical index of 124. The second cesarean section was in a patient with hydramnios and a breech presentation. She was given a trial labor of thirty-eight hours, during which time there seemed to be no disproportion. After full dilatation and the membranes had ruptured, it became evident that this woman had a large baby, frank breech. Her obstetric index was 138, and she had good pains. Several attempts were made to extract the breech and to break it up into a footling breech, but unsuccessfully. As a final resort, a cesarean section was performed and the patient's baby weighed 4200 grams. The incidence of cesarean section in this group is roughly 4 per cent.

There was also one stillbirth (a macerated fetus) in a patient with nephritic toxemia who had an obstetric index of 130, ineffectual pains, and a resultant labor of thirty-seven hours.

Plate 4.—Plate 4 contains the remaining groups for comparison, the gynecoid-android (28 cases), gynecoid-anthropoid (14 cases), anthropoid-gynecoid (8 cases), anthropoid-android (3 cases), android (6 cases), android-gynecoid (8 cases), android-anthropoid (3 cases), platypelloid (9 cases), platypelloid-gynecoid (4 cases), and asymmetrical (4 cases).

Of these pelves, the android, android-gynecoid, platypelloid and asymmetrical will be discussed because the other combination pelves offered no obstetrical difficulties, with the exception of occasional long labors with poor pains, all terminating spontaneously.

The android group were delivered by cesarean section in three of six cases. Each had a trial labor of twelve, thirteen, and seventeen hours, respectively, the first with poor pains, the second with good pains, and the third with fair pains. All had ruptured membranes and unengaged heads. All had average-sized babies, 3500 and 3600 grams, and their obstetric indices varied from 120, 128, and 130. To be sure, the pure male type of pelvis occurred in our series too infrequently to permit one to come to any definite conclusion, but it suggests that the greatest regard should be paid to this group with its high incidence of operative interference.

In short, the same may be said of the platypelloid group. These patients will have their babies spontaneously if there is available room on the transverse diameter to make up for the deficit in the anteroposterior diameter. Good pains are essential and their babies must be of average size. In our small series, spontaneous deliveries occurred in five out of nine cases, with a duration of labor varying from thirteen to thirty-five hours. The first four cases of the platypelloid group had cesarean sections. Indication in the first case was a definite disproportion with overriding. This patient was given a trial labor of eight hours, with good strong pains and an unengaged head. She had an obstetric index of 122 and a baby weighing 2800 grams. In the third case the patient had an eleven-hour trial labor, breech presentation without progress, and ineffectual pains. She had an obstetric index of 135 and a baby weighing 3700 grams. The fourth patient had a twelve-hour trial labor, ruptured membranes, unengaged head, and good pains, without progress. Her obstetric index was 138, and her baby weighed 3900 grams.

The indication for cesarean section in the android-gynecoid group was a matter of last resort in a woman who had a long labor, with ruptured membranes, poor pains, and several attempts at mid-forceps delivery without success. Her obstetrical index was 131, and her baby weighed 3400 grams. Lack of good pains produced an almost tragic result in a woman who should have had her average-sized baby spontaneously.

The indication for the cesarean section in the asymmetrical group was poor position, left brow associated with ruptured membranes, and no progress after fourteen-hour trial labor.

FETAL POSITIONS

In the series as a whole (320 cases), fetal positions other than vertex occurred as shown in the following table.

IN CONCLUSION

There was no apparent correlation between the position and type of pelvis, with regard to the incidence of operative interference.

TABLE 3.—*Fetal Positions*

Position	Cases	Incidence Per Cent
Breech	11	3
Twins	5	2
Brow	1	.3
Face	1	.3

Fetal mortality, uncorrected, occurred four times in 320 cases—an incidence of 1.3 per cent.

Roentgen-ray pelvimetry is a valuable aid in determining the available space in any given pelvis, but must be coupled with good clinical judgment for the conservative care of obstetric patients.

Good pains are essential in the successful outcome of any obstetrical problem. The majority of women with clinically small pelves have normal spontaneous deliveries, provided their labors are characterized by good effectual uterine contractions and average-sized babies.

Labors that are the most trying upon the endurance and coöperation of patients and attendants alike are those with ineffectual pains.

The gynecoid group as a whole, which comprises 54 per cent of women, have labors eighteen hours or less in 64 per cent of cases, and an operative incidence (cesarean section) in 1.6 per cent of cases.

Combination pelves were free from any operative interference except in one instance. Anthropoid pelves—16 per cent of our series—have labors eighteen hours or less in 57 per cent of our cases. They have only 4 per cent incidence of cesarean section.

The small groups of android and platypelloid pelves have a high operative incidence, roughly 50 per cent. However, one must not lose sight of the fact that these form only 5 per cent of the whole series.

University of California Medical School.

DISCUSSION

ALICE F. MAXWELL, M.D. (University of California Hospital, San Francisco).—Caldwell, Moloy, and Thoms's pioneer investigations of the value of roentgen-ray visualization of the pelvis and the grid method of mensuration have opened up new fields of knowledge of pelvic conformation and have permitted the recognition of pelvic variations which influence the mechanism of labor. Therefore, Doctor Hayden's study of x-ray pelvimetry is timely and important. By precision methods a clear picture of the architecture of the entire bony pelvis may be obtained, important diameters accurately measured, spacial capacity of the various pelvic planes readily appreciated, with the necessary adaptation of the fetal head to the available space foretold, all of which lead to a clearer conception of the mechanism of labor. A comparison of the advantages of roentgen-ray pelvimetry, with the older inadequate method of external and internal pelvimetry, are obvious and require no discussion.

What information of obstetrical interest has been acquired by roentgen-ray visualization? First, one is impressed by the relative infrequency of the so-called typical female pelvis. Thus, Hayden's incidence of gynecoid pelvis in but 54 per cent of 410 cases, Pettit's et al. 51 per cent of 100 cases, and Caldwell-Moloy's 39.5 per cent of 215 cases, suggest that our conception of the gynecoid pelvis as the usual and common standard of the female pelvis must be modified. The relative frequency of the anthropoid pelvis among American women is another striking and unexpected finding (16, 18, and 11.6 per cent in the above series). Previous to the advent of roentgen-ray visualization, it was held that this type of pelvis was of rare and unusual occurrence. A negative finding, but one of significance, is the absence of marked degrees of pelvic contraction in the general population—minor degrees of contraction are not unusual. The conception of spacial relations of the entire pelvis permit a more intelligent attitude in the supervision of labor in the problem case, *i. e.*, the borderline pelvis.

The mechanism of labor involves a nicety of balance between three factors—the passages, the passenger, and the propeling force which dilate the soft parts and extrudes the child through the birth canal. This report indicates that moderate pelvic contractions are not infrequent, excessive development or abnormalities of the child of such a degree as to obstruct labor are relatively uncommon, and should be recognized by ordinary obstetrical observations. The status of both these factors can be recognized before the onset of labor. The efficiency of uterine motor power is unknown until the onset of labor. Doctor Hayden's study clearly indicates that effective contractions readily overcome the resistance met by the child in its passage through a pelvis of moderate contraction; weak contractions are a serious handicap and may be the deciding factor in the outcome of labor in contracted pelves. A combination of borderline pelvic contraction and poor uterine contractility should indicate a strict limitation of the duration of "trial labor," and permit intelligent intervention at a time when neither the mother nor child are jeopardized by exhaustion or infection.

Since it is not possible for every obstetrical patient to have roentgen-ray pelvimetry, the information gained by external and internal pelvimetry, though inadequate must be utilized. An external conjugate of 18.5 centimeters or less suggests a possible contraction of the anterior-posterior diameter of the superior strait; a diagonal conjugate reached at 11.5 centimeters confirms the contraction, funnel pelves can be readily diagnosed by the length of the diameter between the ischial tuberosities. The prominence of the ischial spines and the curvature of the sacrum can be readily determined by palpation. Such observations give useful information; to meet the best interest of the mother and child, however, roentgen-ray visualization of the pelvis should be obtained if any of the above data indicate shortened diameters or abnormal pelvic conformation.

*

D. G. MORTON, M.D. (University of California Hospital, San Francisco).—Doctor Hayden's study reveals not only the incidence of the various types of pelves, as classified by Caldwell and Moloy, to be expected in this section of the country, but also brings out a number of interesting correlations between the pelves and the labors. Of great interest is the fact that the length of labor in these 320 primiparae was related so closely to the type of labor pains. When the pains were poor the labors were long and occasionally required operative interference; when the pains were strong the labors terminated speedily and spontaneously with few exceptions. These relationships held true almost without regard to the types of pelves or their sizes. Such observations have a very important bearing upon the proper conduct of labor, and should lead us to adopt a conservative attitude whenever we are confronted with good pains, regardless of the type of pelvis. Obviously, exact measurement of the pelvis cannot give us a reliable prognosis of the outcome of any labor, without reference to such important factors as the type of pains and the size and presentation of the fetus.

Apparently there are two pelvic types which often lead to difficulty in labor—the android and the platypelloid. Fortunately, they are rare; only five per cent in Doctor Hayden's series. Roentgen-ray pelvimetry can be of great assistance in determining the presence of such pelvic types. It would seem, also, that the obstetrical index is of value in determining the probable outcome of a labor. When this is very low, trouble may be expected, unless the baby also is quite small and the pains good.

I do not believe that we need consider roentgen-ray pelvimetry as a routine part of ordinary obstetrical examinations, but it should certainly be done in all cases in which

there is any suspicion at all of pelvic abnormality or undue smallness, as revealed by the patient's build, and our ordinary external examinations of the pelvis.

*

John N. Ewer, M.D. (411 Thirtieth Street, Oakland). Increased interest has recently been shown in pelvimetry and classification of pelves by the use of the x-ray. Those who employ it have found external pelvic measurements often deceiving. Doctor Hayden's paper represents an excellent study of this subject, with careful correlation of the labors of the patients concerned.

For a considerable length of time I have been employing roentgen pelvimetry in private practice in all primigravidae and in such multigravidae with a history of difficult labor apparently referable to the size or shape of the pelvis. My series of about three hundred cases parallels the above reported series in most significant respects. As would be expected, there was a definite relationship between the size of the pelvis, as expressed by the obstetric index, and failure of engagement of the head. Both series employed the test of labor whenever possible, which, in my opinion, is not carried out as often as it should be. In this connection, I should like to reiterate one of Doctor Hayden's important points, viz., that the strength and efficiency of uterine contractions are one of the major factors determining the outcome of a given labor. The test of labor is, I believe, the only way to accumulate the experience necessary to form the basis of judgment as to what influence a given size or type of pelvis may have on the necessity for operative delivery. The efficiency of contractions may be the deciding factor in a case of so-called "borderline pelvis." An exact knowledge of a given pelvis will, however, obviate many unnecessary cesarean sections or instances of dangerous procrastination.

The position of the baby does not seem to be influenced to a great degree by either the size or shape of the pelvis after engagement has taken place. The incidence of occiput posteriors requiring interference or born spontaneously as such in my cases has closely paralleled the incidence of the sizes and types of pelves encountered in the whole series. That other factors than the bony pelvis must also be involved in the etiology of occiput posterior is suggested by the fact that, of forty such cases requiring interference, seven were delivered spontaneously in a subsequent labor, and all delivered in occiput anterior, some with surprising rapidity. It would seem poor obstetric practice to advise elective cesarean section to a woman who had had one labor made difficult by anterior rotation failure unless other factors were also present which would make such a decision justifiable.

Modern procedures impose no sacrifice of obstetric art if they invite a closer understanding of the problem involved.

CLINICAL MANAGEMENT OF SKIN CANCER*

By Eric Liljencrantz, M.D.
and
George V. Kulchar, M.D.
San Francisco

Discussion *by Harry J. Templeton, M.D., Oakland; Clyde K. Emery, M.D., Los Angeles.*

THE proper management of skin cancer depends upon (1) accurate diagnosis; (2) adequate treatment of an adequate area; and (3) energetic follow-up.

Accurate diagnosis entails differentiation between malignant and benign lesions, and, further, in the malignant ones, the exact identification of cell type. We have not found it possible to make these very important distinctions accurately without biopsy.

DIFFERENTIAL DIAGNOSIS BETWEEN BENIGN AND MALIGNANT LESIONS

In general, the distinction between benign and malignant skin lesions is not difficult. We have found the question arises sufficiently often, however, to warrant routine biopsy in all cases of suspected cutaneous malignancy.

The problem can be illuminated far more effectively by reference to the accompanying photographs than by verbal description.

Senile keratoses, along with erythroplasia and Bowen's disease, are among the commonest borderline lesions, and are to be regarded with constant suspicion. Their appearance may be markedly altered by inflammatory changes. Early signs of malignant change may be (1) tenaciously adherent thickened crusts, which leave a finely granular bleeding base when torn off; (2) marginal proliferation and induration, with solid or with pearly nodular rolled edges; and (3) central ulceration, with crusting or cornification. Malignant change may be evident histologically, with minimal clinical evidence.

Sebaceous and epithelial cysts, simple papillomata, and infectious granulomata occasionally may cause confusion. We have made the error of calling benign lesions malignant about as frequently as we have treated malignant neoplasms as benign.

The differentiation between hemangioma and melanoma seldom should be difficult. Occasional deeply situated hemangiomata, however, may be so intensely colored that they closely resemble melanoma. Melanomata may masquerade as infected granulomata.

The comparative rarity of cutaneous sarcoma, endothelioma, lymphoblastoma, mycosis fungoides, and various metastatic carcinomata, and the infinite clinical variety in which they may occur, render exact identification, proper management, and prognosis impossible without accurate histological information.

THE IMPORTANCE OF DETERMINING CELL TYPE IN CUTANEOUS CARCINOMA

Primary skin carcinoma is usually classified as:

1. Squamous cell or epidermoid carcinoma.
2. Basal cell noncornifying carcinoma, or rodent ulcer.
3. Mixed types.
4. Adenocarcinoma (arising in sweat and sebaceous glands).

Our experience, in keeping with that of others, is that the vast majority of skin carcinomata is included in the first two groups.[1,2] Mixed lesions constitute probably less than 5 per cent of skin carcinomata, and the primary adenocarcinomata less than 1 per cent.

The question of histogenesis of these types should be mentioned briefly to call attention to a seeming paradox in the generally accepted termi-

* From the Tumor Clinic, Stanford University School of Medicine, San Francisco.

Read before the Dermatology and Syphilology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

Squamous Cell Carcinoma Epidermoid or Prickle Cell Type	Basal Cell Carcinoma Rodent Ulcer
Accurate Differentiation Not Possible Without Microscopic Examination	
Relatively short course.	Chronic course—repeated crusting and ulceration, gradual enlargement.
Large (over six to ten millimeters) lesion present less than one year.	Duration over three to four years.
Local circumjacent hyperemia.	Circumjacent inflammation usually absent.
Cornification (not crusts).	Crusting, no definite horny material.
Solid border—elevated, hard, with visible blood vessels.	Pearly nodular rolled edge.
Fetid purulent exudate from late lesion.	Occasional bleeding, serosanguinous discharge.
Location Correlated With Lesion Type—In Itself No Reliance Both Types May Occur Anywhere on Skin	
Principally on mucous membrane, mucocutaneous junctions, and on the extremities.	Chiefly on the face, especially nose, forehead, eyelids, temples, scalp.
Lower lip, penis, vulva.	Upper lip.
Age: Patients usually age 30 to 50.	Age: Patients usually over 50.
Reasons That Make Differential Diagnosis Important	
Metastasize early to regional nodes. Distant metastases not uncommon.	Rarely metastasize at any stage. Persistent tendency to local recurrence. Commonly multiple.
May be relatively radioresistant.	Relatively radiosensitive.

nology. The term "basal cell carcinoma" intimates that these lesions arise from the most actively proliferating layer of the skin; yet these tumors are notoriously slow-growing and histologically well differentiated. On the other hand, the term "squamous-cell carcinoma" implies origin in the most mature layers of the skin. It does not seem likely that such inactive layers should give rise often to poorly differentiated tumors capable of such rapid growth and spread. Haythorn [2] has presented strong evidence, on the basis of both distribution and histology, that typical Jacobian rodent ulcers do not originate in the basal-cell layer. Pending further evidence or wider acceptance of Haythorn's views, it probably would be more satisfactory to use the nonconmittal, simple descriptive term, "rodent carcinoma," for the noncornifying lesions, and the term "epidermoid carcinoma," for the cornifying or acanthomatous type.

Epidermoid carcinoma is a malignant neoplasm which spreads by true metastasis, but which may vary in clinical course from indolent localized growth to wild widespread lymph and blood stream dissemination. One thousand autopsies performed on patients with carcinoma at the Stanford University School of Medicine include twenty-four patients dying of epidermoid skin cancer. The mortality from this disease in Willis's series is roughly comparable.

True rodent carcinoma is a locally infiltrating lesion which may vary widely in rate of growth. Although multiple lesions [3] are common, it may be said that rodent carcinoma virtually never metastasizes. The series reported by Haythorn and by Warren et al., contains no instance of metastasis of a rodent carcinoma in over 2,700 cases of skin cancer. Our out-patient clinic records fail to reveal any instance of such metastasis. Willis reports that no proved instance of blood-borne metastasis to viscera has been recorded.[4] Niles [5] carefully searched the literature on this question in 1931. He was able to find "only five histologically proved cases of metastasis of a pure basal-cell epithelioma in which both the original growth and the metastasis were of pure basal-cell type," and reports an additional case of mixed type. The accompanying photomicrocraphs of these metastatic tumors, however, suggest pure noncornifying epidermoid carcinoma.

The extreme rarity of metastasis from rodent carcinoma and the frequency of metastasis from epidermoid only add weight to the importance of distinguishing sharply between lesions with such reliably different habits of growth.

Many clinical criteria exist that are correlated with cell type.[6,7] The commoner ones are listed in Chart 1. We have not found any single clinical criterion or group of criteria, however, that is entirely reliable. The age of the patient may be misleading, as we have found epidermoid carcinoma in many patients over fifty, and have found rodent carcinoma in a few under fifty. The rate of growth and size of the lesions are not reliable indices. Circumjacent erythema is not a definitive sign; cornification is rarely well marked. Also, the appearance of either type of lesion can be profoundly altered by secondary infection.

Location is not reliable. We have encountered epidermoid carcinoma occurring on all the areas usually preferred by rodent carcinoma, namely, nose, forehead, eyelids, temples, and scalp. Rodent carcinoma, likewise, occasionally does occur on the extremities, near the mucocutaneous junction, and on the scrotum, but we have never found it on the lower lip, penis, or vulva.

Perhaps the most helpful sign is the pearly or waxy, rather soft, nodular border of the early rodent carcinoma.

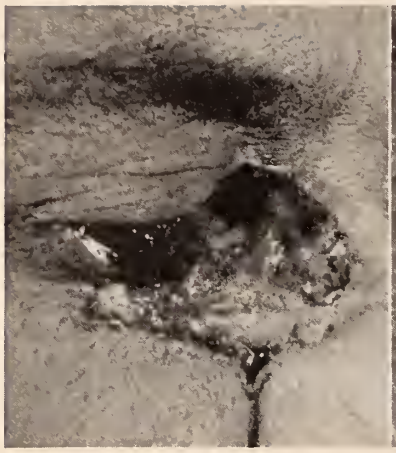

Fig. 1

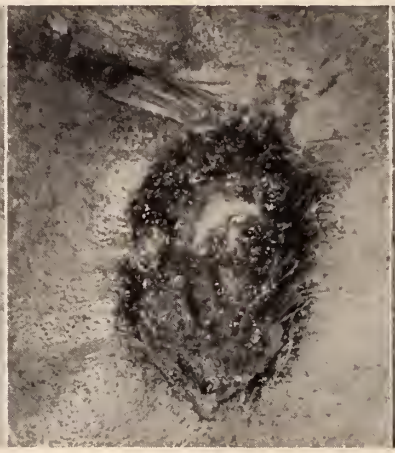

Fig. 2

Fig. 3

Fig. 1.—Recurrent rodent carcinoma. Patient, aged 45. Lesion undertreated with x-ray ten years before, with radium seven years before, and radium again three years before this photograph was taken. Now badly out of hand. Cure possible only by mutilating operation removing bone and sacrificing eye. Compare with the epidermoid lesion shown in Figure 6.

Fig. 2.—Advanced, maltreated rodent ulcer. Patient, aged 64. Lesion inadequately treated on at least three occasions with radium over ten-year period. Extensive ulceration with secondary infection, fixation, and salivary fistula. Note skin atrophy (postradiation?) at upper pole, and spontaneous pronounced peripheral cicatrizing reaction at anterior edge. The margins are rather flat and irregularly nodular rather than sharply raised. Compare with Figure 9*a*.

Fig. 3.—Epidermoid carcinoma. Patient, aged 75. Both rodent and epidermoid carcinoma are common on and about the ear.

Figures 1-6 show more clearly than words examples ranging from entirely typical lesions of both types in which clinical diagnosis was easy, to strikingly atypical lesions in which exact diagnosis was impossible without histologic examination.

Summarizing the foregoing observations leads us to the conclusion that even fairly dependable diagnosis of skin cancer is frequently impossible without biopsy. In early stages the border line between benign and malignant lesions cannot be determined, and in later stages the important distinction between rodent ulcer and epidermoid carcinomas cannot be made with certainty. Even less accurately can one predict histological grading, or identify mixed or rare types of cutaneous malignancy.

BIOPSY

Microscopical examination of tissue represents by far the most reliable diagnostic aid, but even here questions arise which require careful correlation of the microscopic findings with clinical data.

We do not believe that careful biopsy of skin cancer adds to the danger of metastasis [8] except in the case of melanoma. There can be little question of this when removing tissue from an ulcerative lesion, and in early cases the entire lesion can be excised with less trauma than that to which the patient's everyday activities or a careless clinical examination would subject it. If one wishes to be doubly cautious, biopsy can be delayed until after a course of irradiation has been well started.

Melanoma, benign or malignant, never should be cut into. Electrodesiccation and other irritative measures invite disaster, and are to be strictly avoided. Our experience with malignant melanomata, in keeping with that of other series,[9] forces us to the strong conviction that all pigmented lesions should either be left strictly alone or widely and deeply excised. Degree of pigmentation is not a reliable index of potential malignancy, hence innocent-appearing, faintly pigmented nevi should be approached with the same caution.

TECHNIQUE FOR BIOPSY

The first requisite in performing biopsy is to obtain tissue that is truly representative of the lesion. The specimen removed should include a margin of normal tissue, and should extend deeply enough to give some evidence as to the infiltrative properties of the tumor. This can be done nicely either by removing a deep, narrow wedge of tissue with a pointed, fine scalpel and fine-toothed forceps, or by using a five-millimeter skin punch. We have found the latter instrument particularly satisfactory in yielding a maximum volume of tissue cleanly excised to a satisfactory depth with a minimum of trauma. If the lesion is large, more than one specimen can be taken. Usually, however, the five-millimeter piece will be sufficient to demonstrate even mixed-cell types. Local anesthesia should be injected at the margin. Mercurochrome or other dye applied to the skin will help to identify the surface so that it may be properly mounted in paraffin. The site of biopsy may be cauterized with silver nitrate stick.

TREATMENT

It has been our experience that the method of treatment of skin cancer is not as important as the skill and thoroughness with which the method chosen is applied. Excision, irradiation, and locally destructive methods have been used, and there have been many failures for all three methods.

In considering the results of treatment, one must distinguish clearly between true recurrences and multiple lesions. Difficulties in the diagnosis of putative recurrences also arise. Multiple independent rodent carcinomata are common, and we have

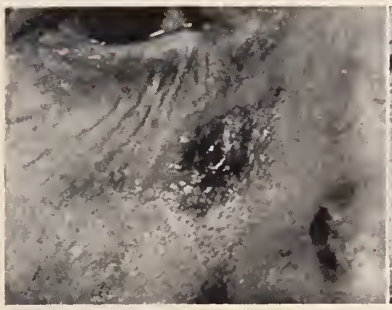

Fig. 4

Fig. 5

Fig. 6

Fig. 4.—Epidermoid carcinoma. Patient, aged 67. Duration two years. Appearance and location more characteristic of rodent carcinoma.

Fig. 5.—Mixed tumor. Patient, aged 73. Lesion present one year. Had recently grown rapidly following application of tar ointment. Biopsy revealed an invasive rodent carcinoma with acanthomatous (epidermoid) areas. Epidermoid carcinoma not uncommon on nose.

Fig. 6.—Fatal epidermoid carcinoma. Patient, aged 55. Untreated lesion of over three years' duration. Heavy irradiation arrested the primary. Extensive regional glandular metastases occurred. Compare in appearance and prognosis with Figure 1.

seen several instances of rodent ulcer and epidermoid carcinoma occurring in the same patient.

SURGERY

Failure to cure by excision is usually due to the removal of an inadequate amount of tissue. A wide margin must be allowed on all sides of the lesion as well as beneath it. Closure usually can be effected by undercutting or, if necessary, by the use of tissue flaps. Careful planning of incisions, meticulous attention to asepsis, hemostasis, and the avoidance of trauma and tension in closure usually will result in satisfactory cosmetic results even on the face.

IRRADIATION

Failures to cure by irradiation are due to inadequate dosage as well as to the treatment of an inadequate area.

Since many misconceptions prevail concerning the use of radium and x-ray, particularly in regard to choice of quality of radiation, it may be justifiable to mention briefly some fundamental considerations.

QUALITY OF RADIATION

Quality of radiation is determined by the wavelengths present. Rays of short wavelength are spoken of as "hard rays," and conversely those of long wavelength as "soft rays." In the case of radium, quality is influenced by the filtration applied, and in the case of x-rays, by both voltage and filtration. High voltages produce both long and short wavelengths. Heavy filters absorb the former, leaving a hard, emergent beam containing only the shorter wavelengths. In radiation produced at low voltages, the shorter wavelengths are absent.

Quality of radiation has a great influence on the distribution of the physical effect within the body due to differences in absorption of the radiation by the tissues. But the actual physical effect on tissue, once the radiation has been absorbed, is qualitatively hardly at all different, for gamma rays, x-rays, and beta rays (the whole gamut of radiation quality). Differential biological effect is most uncertain.

As an example, one may compare the action of very hard x-rays with that of very soft x-rays. If equal surface doses of these two qualities of radiation be given (to equal areas from the same distance), it will be found that one-half the energy of the soft radiation may be absorbed in the first 2 to 3 centimeters of tissue, whereas in the case of the hard radiation, some 8 to 10 centimeters of tissue may be traversed before one-half of its energy is absorbed.

If one is concerned only with the treatment of superficial lesions, the use of hard radiation possesses no demonstrable advantages. It introduces the disadvantage of irradiating to greater depths than necessary and, therefore, unnecessarily injuring large amounts of tissue.

It should be made clear that the usefulness of the shorter wavelengths, therefore, lies primarily in the ability of such radiation to reach deep lesions rather than upon any superior selective biological action on the lesions once they have been reached. There is no demonstrable difference in such biological actions as production of erythema, or degree of destruction of normal or abnormal tissues, in the superficial layers where the intensities of irradiation are comparable.

The same arguments hold true in comparing the biological action of the gamma rays of radium (of very short wavelength) with that of soft x-rays, namely, that differences in the strata in which these rays are absorbed is a far more important consideration than any differences in biophysical action that may follow such absorption.

The beta rays of radium represent very soft radiation, and are almost entirely absorbed by the first few millimeters of tissue. Once sufficient filtration has been applied to absorb virtually all of the beta rays (0.5 millimeter of platinum or its equivalent) additional filtration does not appreciably alter the quality of the remaining very hard (gamma) rays.

Filtered radium usually is used concentrated and close to the surface, so that the effect is limited to a small volume of tissue. This is due not to absorption, but to the effect of distance. All radiant energy is dissipated in space directly in proportion

Fig. 7

Fig. 8

Fig. 7.—Epidermoid carcinoma. Patient, aged 57. Lesions here are usually rodent carcinoma. Small lesion arose five years previously; cautery was used two years ago. Rapid growth past six months.

Fig. 8.—Same patient as shown in Figure 7 three months after heavy irradiation (6,000 r divided into twelve daily doses of 500 r each to 4 by 7 centimeters oval area).

to the square of the distance from its source (the inverse square law). The skin surface 5 millimeters from a piece of radium gets nine times the tissue dose received by tissue 10 millimeters below the surface.

X-RAY DOSAGE

If the above principles are applied to the treatment of cutaneous lesions with x-rays, it will be apparent that comparatively soft radiation is preferable. In practice, voltages in the range of 90-130 KV are adequate. No filter is necessary for treatment of lesions extending less than one centimeter below the surface. Filtration in excess of one millimeter of aluminum seldom should be required in treating skin cancer.

The limits of x-ray dosage vary sharply with the surface area of the treatment field. For small skin areas, a cauterizing dose of unfiltered x-ray may be given in a single sitting. On the face we have found 3000 r in a single dose safe for areas up to 2½ centimeters in diameter. On hand or foot, we think 1½ centimeter the safe limit for such a single dose, and then only if the circulation is normal.

X-radiation applied in this manner represents treatment by local destruction, and usually suffices to eradicate small local malignant lesions, regardless of cell type. The radiation reaction which follows such treatment usually results in destruction of surface epithelium, with healing by granulation to produce a soft, smooth, inconspicuous scar. The area treated can be very accurately outlined by cutting shields of thin lead to be applied directly to the skin (see Figures 9a and 9b). We cut a special shield for each case.

When larger areas or higher doses have been employed, we have resorted to fractional dosage. Total dosage (measured in air) may vary from 7000 r given in ten daily doses to a 5 square centimeter area, to 4000-6000 r given in daily doses of 200-300 r to areas of 50-150 square centimeter. The larger the area, the smaller are both the daily and the total doses that may be administered with safety. We must calculate, of course, the dose extremely accurately and be certain that the dose is administered exactly as calculated, particularly when using unfiltered x-ray. Short treatment distances [10] may be used by which treatment time may be greatly reduced.

INFLUENCE OF TYPE OF LESION

The cell type of the lesion is to be considered in deciding upon the area and total dosage to be used. We believe epidermoid carcinoma should be given wider margin (7 millimeters for a small lesion, 10 millimeters or even more for a large one) around all visible and palpable tumor, and that the highest total dosage compatible with this area should be given. Rodent carcinoma can be treated with a narrower margin and somewhat lower total dosage (4000-5000 r in divided doses for a large lesion). However, 3000 r should be used for any cutaneous malignancy small enough to treat at a single sitting.

We feel that a marginal recurrence of a rodent carcinoma is still readily curable, but look on recurrent epidermoid as definitely dangerous.

RADIUM DOSAGE

The technique of radium application varies greatly with location of the lesion and type of applicator used (plaque, needles, moulage pack), and cannot be discussed in detail here.[11] Uniform distribution and adequate dosage are essential. Our own practice is usually to use external packs to give gamma radiation from many different points surrounding the lesion, and to calculate the dose

Fig. 9*a*

Fig. 9*b*

Figs. 9*a-b*.—Horny protuberant epidermoid carcinoma recurrent after repeated surgery and irradiation. Patient, aged 87. If direct irradiation of the horn and surrounding skin is used, absorption of radiation within the lesion will result in inadequate dosage being delivered to its base, while a maximum tolerable dose is received by the surrounding skin. Electrosurgery (coagulation or radioknife) may be used to trim the horn to the level of the surrounding skin before irradiating the base, or the method illustrated may be employed.

(*a*) Shield in place to outline total treatment area (4 by 5 centimeters).

(*b*) Paraffin block cut to fit closely around the horn to its full height. Absorption of radiation in paraffin is roughly equivalent to that in flesh, so that the underlying skin does not receive higher dosage than does the *base* of the horn.

so that the maximum surface dosage received from all these points is the equivalent of 550-800 milligram hours at one centimeter distance (roughly five to seven threshold erythema doses).

CHOICE BETWEEN RADIUM AND X-RAY

For most cases of skin cancer we believe that it is easier to obtain exactly the desired intensity and uniformity of tissue dose with x-ray than with filtered radium. Also it is possible to confine the irradiation precisely to a definite surface area. Only for very thin lesions is the use of beta ray from a radium plaque satisfactory, for which it is a really elegant tool.

As stated previously, we are unable to recognize any superior biologic effect of gamma rays over x-rays.

PROGNOSIS

The prognosis of skin cancer depends above all upon the anatomical extent of the lesion. Numerous workers report small noninfiltrating epitheliomata of all types cured in over 80 per cent of cases by any of the several acceptable methods adequately applied. Magnusson[12] states that prognosis becomes decidedly less favorable when the tumor exceeds four square centimeters area. Miescher[13] reports 90 per cent primary cures following x-ray treatment for small epidermoid lesions as contrasted with 45 per cent for larger tumors of the same type. Infiltrated tumors present a poorer prognosis. Nielsen[14] reports only 21 per cent five-year cures for such lesions treated with filtered radium plaque. Rodent carcinoma always offer a better prognosis than epidermoid, particularly in more advanced cases. The involvement of regional glands renders complete cure by any method or combination of methods unlikely, although many significant arrests (five years or more) are obtainable through radical treatment.

In the case of epidermoid lesions, histological grading, after the method of Broders[15] or similar schemes, may add valuable prognostic data. It is true that different portions of the same tumor may appear to be of different degrees of malignancy, but this variation usually is over adjacent portions of the scale of malignancy. For example, it is not uncommon to find tissue of both Grades I and II, II and III, or III and IV, from the same tumor, but rarely are Grades I and IV, or even I and III, found in any single lesion.

Ordinarily the more mature or well-differentiated lesions (Grades I and II) grow more slowly and have less tendency to metastasize, while the more anaplastic or poorly differentiated tumors (Grade III and IV) grow more rapidly and metastasize more widely. From the therapeutic standpoint it can be said in general that the maturer tumors are amenable to treatment by complete surgical extirpation, and require really massive doses of radiation for complete destruction. Anaplastic lesions (Grades III and IV) are very radiosensitive. Since attempts at extirpation are likely to cause dissemination, surgical measures should be limited to early localized lesions in this group. The metastases of anaplastic lesions never should be resected.

FOLLOW-UP

The necessity for maintaining an adequate follow-up system should be obvious when one considers the frequency of multiple skin cancers, recurrences, and metastases. This is frequently neglected in both clinic and private practice. Many unfortunate results, as well as time, trouble, and expense, can be spared if the necessity for follow-

up visits is carefully explained to patients at the time they are first treated. We think it preferable to have the fee made for the treatment cover the follow-up visits as well. When this is done, patients are much more willing to return frequently. Specific return appointment cards should be given. When these appointments are broken there should be no delay in using telephone or letter to get in touch with the patient. This is an important direct responsibility of the physician when dealing with cancer of any sort, and should not be neglected.

CONCLUSIONS

1. Accurate diagnosis is essential for correct treatment of skin cancer. Accurate diagnosis is frequently not possible without histological examination.

2. The distinction between rodent and epidermoid carcinoma is of unquestioned practical importance in regard to both treatment and prognosis.

3. Considerable choice of treatment methods exists. The skill and thoroughness with which treatment is applied may be of greater importance than the method selected.

4. Within wide limits the quality of radiation used is of little or no importance. High intensity and uniformity of tissue dose are essential.

5. Conscientious follow-up is of great importance, and frequently is neglected in both clinic and private practice.

DISCUSSION

HARRY J. TEMPLETON, M.D. (3115 Webster Street, Oakland).—It seems to me that the ideas presented in the authors' paper represent the last word in radiation therapy of cutaneous malignancies, and that such exact and meticulous technique as they advocate should be used when radiation therapy is indicated. I am certain that both Doctor Liljencrantz and Doctor Kulchar recognize the principle that various types are valuable in the treatment of skin cancer, and that a physician should use whichever adequate method he is most familiar with. Their preference is for radiation therapy. My own belief is that while radiation therapy is invaluable in certain select cases, the average easily accessible cutaneous malignancy can be more certainly cured by methods of local destruction, such as electrodesiccation, electrocoagulation, the actual cautery, or widespread excision. I will base my entire argument upon the fact that certain cancer cells are not radiosensitive, while it is obvious that it is impossible for any cancer cell to resist destruction by electrocoagulation or the actual cautery. Those who advocate radiation therapy will answer this argument by stating that, if they so desire, they can give sufficiently heavy doses of radiation as to produce as thorough a cauterization of the local growth as would a cautery. This is true, but, unfortunately, such heavy doses administer unnecessarily heavy depth doses to cells beyond the area which one desires to cauterize. This accounts for the fact that scars from radiation therapy become more conspicuous, atrophic and telangiectatic as the years go on, while scars from coagulation or the cautery become softer and less noticeable with time.

Because of these facts it is my custom to reserve my radium and x-ray therapy for the weak and aged, and for those epitheliomas which are not easily accessible.

❋

CLYDE K. EMERY, M. D. (445 South Kingsley Drive, Los Angeles).—It is a great comfort to those of us who habitually deal with skin cancer to hear such an excellent summary of the subject as Doctors Liljencrantz and Kulchar have presented. I can only emphasize a few points, primarily that of adequacy of treatment.

We regard radiation treatment as being of two types. First, the cauterizing dose which is given by the soft radiation of x-ray or by radium. The aim in treatment is to kill in one series of treatments all cancer cells. This is comparable to a complete surgical excision, the advantage being that it can be applied to include a wider area of apparently normal tissue. This normal area, we feel, should extend to a full centimeter or more around the average skin cancer, whether basal cell or squamous cell, with particular care being taken to radiate the line of lymphatic infiltration in the case of epidermoid carcinoma. In the case of the noncornifying rodent ulcer, treatment is given to all areas most likely to be involved by direct invasion. In the nasolabial fold, this includes the side of the nose and all tissue between the inner canthus and the upper lip. If radium is given either on the surface or interstitially, an open area should have 5,000 to 6,000 r units of uniform intensity. Around the nose and eyelids it should be reduced 20 to 25 per cent.

The second method of radiation treatment, that of smaller doses over a longer time—as is desirable in treating deep-seated cancer—is seldom necessary on the skin. The occasional treatments, and the handling of skin cancer as though it were a skin infection, cannot be too strongly denounced as inadequate.

I would also stress that portion of the paper which deals with the follow-up, and particularly to heartily concur with the method of making one original fee to cover the entire handling of the case, including all of the subsequent follow-up visits and examinations. This relieves the physician of any uncomfortable feeling of mercenary interest in the patient's subsequent visits, insures more adequate follow-up, and enormously improves the friendly relationship between the patient and the doctor.

CHRONIC DUODENAL STASIS*

A SYNDROME WITH NEUROLOGICAL SYMPTOMS

By Frederick Leet Reichert, M.D.
San Francisco

Discussion *by Nelson J. Howard, M.D., San Francisco; John Homer Woolsey, M.D., Woodland.*

THE clinical entity of chronic duodenal stasis was evolved some thirty years ago from an awakened interest in the seriousness of acute gastric dilatation. At that time, the reports of careful postmortem examinations witnessed by alert surgeons reëmphasized a pathological condition that had been mentioned sporadically in the literature since von Rokitansky,[1] in 1863, clearly described the acute gastric and duodenal dilatation from pressure of the mesenteric root on the third portion of the duodenum.

DISCUSSIONS IN THE LITERATURE

In Glenard's [2] classical presentation of enteroptosis, in 1889, a constriction in the duodenal-jejunal region is described as being caused by the traction produced by an acutely dilated stomach.

Fagge's [3] report, in 1873, on acute dilatation of the stomach, called attention to the relief experienced by the systematic use of the stomach tube, and the washing out of the gastric cavity with Vichy water, as suggested by Kussmaul [4] in 1869.

Schnitzler,[5] in 1895, in a case of acute gastric dilatation, believed due to mesenteric obstruction, reported a successful outcome by changing the patient from the dorsal to a ventral position.

Both Glenard [2] and Kundrat [6] felt that persistent, uncomplicated obstruction of the duodenum by the root of the mesentery was not uncommon, and that it led to gradual dilatation of the stomach and duodenum.

The mesenteric traction producing duodenal occlusion was thought to be due to the displacement of collapsed intestines into the pelvis. By this displacement, tension was put on the mesentery, thereby changing the cord-like superior mesenteric vessels into a constricting band that obliterated the lumen of the duodenum (Figs. 1 and 2). Albrecht's [7] paper, in 1899, strongly supported this theory.

Thomson,[8] in 1901 and 1902, discussed the different theories and favored the belief that, in a majority of the cases, a primary paralysis of the stomach was the underlying cause since, in his examinations, he found that the constrictions of the duodenum occurred at various levels, which would not be expected if the obstruction were due to compression by the superior mesenteric vessels.

Thomson's neuromuscular theory, of acute gastric dilatation, found further support in Laffer's [9] paper, in 1908, in which his experimental, clinical and pathological evidence indicated a primary disturbance of innervation affecting the gastric nerves, or their centers in the brain or cord. The recent

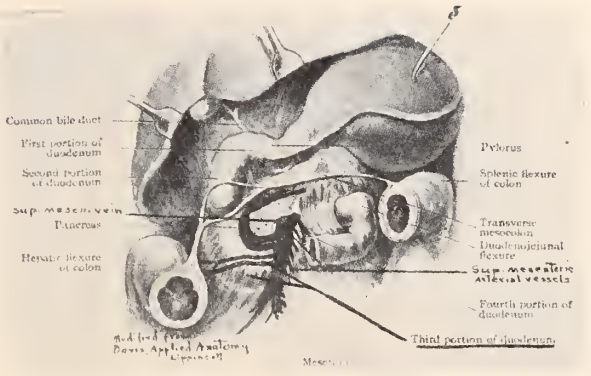

Fig. 1.—The duodenum, showing its course and relation to the surrounding organs. Compression of the third portion of the duodenum by the superior mesenteric vessels.

experimental work of Dragstedt, Montgomery, Ellis, and Matthews,[10] in 1931, again revealed that acute gastric dilatation was due to reflex inhibition of the peripheral motor mechanism through efferent impulses reaching the stomach by way of the vagi and splanchnics. They have postulated that stimulation of either visceral or somatic sensory nerves might produce such reflex gastric inhibition, and attributed the cause of death to failure to resorb the gastric and pancreatic juices and the inorganic elements, especially sodium and chlorin. The failure to resorb was dependent upon the inability of the atonic stomach and duodenum to propel the secretions into the lower intestines. In certain cases the occurrence of a secondary mesenteric obstruction to the inferior horizontal portion of the duodenum provided a further obstacle to the passage of secretions.

At the time of publication of Zade's [11] article, in 1905, on postoperative acute gastric dilatation or gastromesenteric ileus, as he termed it, the American surgeons were becoming aware of the seriousness of acute dilatation of the stomach, with Ochsner,[12] Finney,[13] and Bloodgood [14] reporting their observations. Finney felt that acute dilatation of the stomach and gastromesenteric ileus could not be differentiated; but Lewellys F. Barker,[15] in his discussion of Finney's reports, in 1905, advanced a differential diagnosis by the examination of the gastric contents for pancreatic ferments. It was also his suggestion that duodenojejunostomy be substituted for gastro-enterostomy, which had been found unsatisfactory.

Chronicity of this condition with clinically acute exacerbations was described by Bloodgood [16] in 1907, when he also proposed duodenojejunostomy as the proper operative procedure. The first duodenojejunostomy for chronic gastromesenteric ileus was performed by Stavely [17] in 1907, and reported by him, in 1908, as having been successful (Fig. 3).

Bloodgood in 1907, Stavely and Codman [18] in 1908, described and emphasized the chronic and more common condition of obstruction of the duodenum, and it is this time period which marks the recognition of a clinical entity termed chronic gastromesenteric ileus, chronic duodenal stenosis, chronic duodenal stasis or ileus, chronic intermittent duodenal obstruction and unstable or irritable duodenum.

Since 1908 the subject of chronic duodenal stasis has been kept before the medical profession, but little has been added to the earlier observations of symptoms and treatment. Papers by such authors as Wilkie,[19] McKenty,[20] Higgins,[21] Shattuck and Imboden,[22] and Friedenwald and Feldman,[23] are worthy of study.

AUTHOR'S PRESENTATION

My purpose in again presenting this subject is to emphasize the fact that certain symptoms may be so prominent that their cause is sought for elsewhere than in the toxicity of obstructed duodenal contents. I refer to those cases of chronic duodenal stasis with symptoms suggesting migraine.

or facial and cervical neuralgia, or even intracranial involvement.

I have abstracted the protocols of three illustrative cases which were referred because of neurological symptoms. A careful history in each case, a review of the physical and laboratory findings, and the confirmation by roentgenographic studies of the condition of chronic duodenal stasis led to the proper medical and postural treatment with relief of all symptoms, including the paramount neurological complaints.

REPORT OF CASES

Case 1.—Mrs. L. A. M., A-277, age fifty-six, was admitted to the Stanford University Hospital on May 8, 1930, with the complaint of burning in the stomach for fourteen months, following an attack of influenza. The convalescence was prolonged with gastric distention, sour eructations, anorexia, nausea and vomiting, constipation, vertigo, tinnitus, severe headaches, and loss of fifty pounds in weight. Appendectomy a year ago brought no relief. Examinations of the patient, and of the urine and stools were negative. The Wassermann was negative. Her blood pressure was 125/85. Impression: possible migraine or gastric neurosis and psychoneurosis. Gastric analysis showed normal acid and low volume. Gastro-intestinal roentgenographic series showed chronic duodenal stasis (Fig. 4). The gall-bladder visualized normally. Treatment in the hospital consisted of frequent feedings, followed each time by the knee-chest position for fifteen minutes, and bed rest with the foot of the bed elevated. Gastric and neurological symptoms improved in three days, and the patient was discharged after a week of postural therapy with frequent feedings of selected bland diet. A belladonna and bromid mixture was prescribed and used in the hospital as well as at home, where bed rest was continued for a month. A report seven years later stated that she had experienced no return of symptoms, and had regained the fifty pounds in weight.

* * *

Case 2.—Miss M. M., was seen by her physician in 1933, complaining of a bad headache, present for a period of years and, apparently, of a familial type. Two attacks of giant urticaria during the previous year were attributed to an allergic type of migraine. The headaches recurred every two to three weeks and were associated with nausea and vomiting. The day before the headache occurred she would be particularly hungry, and thirty hours after eating the headache would be intense, and she would vomit all the food she had taken. Thyroid extract was given for a low basal metabolic rate, but without relief, and the attacks became became more frequent and severe. Roentgenologically, an ulcer on the greater curvature was seen. However, on exploration, the stomach was normal, though the jejunum appeared to be pinched at the ligament of Treitz, and the constricting band was cut. Convalescence was uneventful, and the patient had no further trouble for a year, at which time the attacks recurred. I was asked to see her because of the severe headaches. Roentgenograms of her upper intestinal tract at this time revealed chronic duodenal stasis (Fig. 5). Relief was secured by dietary and postural measures.

* * *

Case 3.—Miss E. M. K., A-59261, age sixteen, in the fall of 1936 complained of dizziness, headaches, vomiting, and some abdominal pain. A year before, a right radical mastoidectomy was followed by an uneventful convalescence of three weeks. A month later dizziness developed, and tinnitus appeared in the right ear. Nausea, with vomiting, occurred after meals, no matter how small the amount of food taken. Occasional colicky pains in the right lower quadrant were accompanied by tenderness in this region. Recently the mild bitemporal headaches became severe and bursting in character. Vestibular tests showed evidence of bilateral labyrinthitis, but there was no spontaneous nystagmus, nor other neurological signs. Impression: brain abscess and subacute appendicitis. However, these complaints in a thin, asthenic type of patient suggested chronic duodenal stasis, and this was confirmed roentgenologically (Fig. 6). The proper dietary and postural measures completely relieved the patient of all symptoms.

In four other patients the symptoms led to prompt roentgenological studies of the upper intestinal tract, which showed the characteristic picture of chronic duodenal stasis. Medical and postural measures gave successful results in each case.

Fig. 6.—Roentgenogram, Case 3, chronic duodenal stasis. Visualization of the third portion of duodenum before treatment.

ETIOLOGY

In this paper consideration of the etiological factors will be limited to the form of chronic duodenal stasis resulting from pinching of the third portion of the duodenum between the root of the mesenteric vessels and the aorta. The same clinical features may be produced by congenital anomalies such as atresia, certain duodenal diverticula, annular pancreas, short mesentery and peritoneal bands. Another factor in its production may be the formation of adhesions such as those angulating the duodenum in certain cases of chronic cholecystitis, or chronic inflammatory thickening of the mesentery, or enlarged retroperitoneal or mesenteric glands, or inflammatory thickening of the ligament of Treitz, or the kinking of the duodenojejunal angle.

Spinal deformities, especially lordosis, low position of the duodenum, excessive motility of the colon, and the pelvic position of the intestines in visceroptosis, are also factors that favor compression of the duodenum.

In man, the third and fourth portions of the duodenum lie behind the peritoneal fold, and that portion behind the root of the mesentery has a flattened to ovoid form. Finney's [13] illustrations in 1906 emphasized the duodenal compression by the root of the mesentery in the erect posture, whereas the anatomical relations of these structures are best suited to the postures assumed by quadrupeds, as illustrated by Codman.[18] McKenty [2] felt that a loose cecum with an elongated parietocolic fold, having its support from the mesentery of the small bowel, is the important factor in the mesenteric occlusion of the duodenum.

SYMPTOMS

The stasis of duodenal and gastric secretions present a variety of symptoms, some of which are due to the toxicity of the duodenal contents. Indigestion and flatulency frequently are experienced one to three hours after meals. If the pylorus is tonic there may be pain, frequently burning in character, in the epigastrium; but if the pylorus is atonic and patulous, the duodenal contents regurgitate into the stomach, and vomiting, without pain, is a common symptom. The vomitus may be copious and, when it contains bile and pancreatic juices, suspicion of a dilated duodenum is aroused, especially in a visceroptotic patient.

Stavely,[17] in 1908, as well as subsequent authors, emphasized the lassitude, malaise, and particularly the headaches, usually frontal or temporal, frequently intense and dominant. Temporal, facial, cervical and scapular pains may be severe and suggest an atypical neuralgia. An associated vertigo may be present. The vomiting, headache, vertigo and other neurological symptoms, are suggestive of migraine or increased intracranial pressure.

After copious emesis, the so-called "bilious attacks" with their toxic symptoms are relieved. The patient quickly associates the taking of food with the onset of symptoms and fears to eat, thus producing a vicious circle, with ensuing loss of weight, anemia, and associated abdominal symptoms that may suggest cholecystitis or appendicitis. Constipation is the usual condition, but it may be accompanied by intermittent diarrhea when some of the toxic contents pass through into the lower intestines.

SIGNS

Examination reveals that most of the patients belong to the asthenic type with evidence of visceroptosis. Some show epigastric tenderness, slight secondary anemia, low blood pressure, and evidence of vasomotor instability.

Gastric analysis is not very helpful, but the roentgenological evidence is well defined and characteristic, permitting a definite diagnosis. Increased motility with duodenal peristalsis, and antiperistalsis and regurgitation of the barium into the stomach are seen by fluoroscopy. Four hours after the barium meal the dilated portions of the duodenum are usually visualized, particularly if the roentgenograms are taken with the patient in the upright position, front view and profile, then lying down, first in the ventral and then in the dorsal position.

TREATMENT

The majority of cases respond to medical therapy and postural treatment. In the case of acute dilatation of the stomach the repeated use of the stomach-tube is supplemented by postural treatment, including the prone position, the knee-chest position and the left lateral position, with the hips elevated. Likewise, in the treatment of chronic duodenal stasis dietary measures are supplemented by bed rest and the same postural treatment just mentioned.

Certainly, bed rest, with the foot of the bed elevated one to two feet, avoidance of the dorsal decubitus, and use of the lateral position, right or left, as frequently as possible, and the knee-chest position for fifteen or more minutes after meals, will overcome the stasis produced by compression of the duodenum by the root of the mesentery. Frequent feeding, every two to four hours, of a

bland, low residue diet, with high caloric and high vitamin value, will increase weight and, in time, deposit fat in the mesentery and improve the visceroptosis.

Abdominal exercises are instituted to strengthen the recti muscles. When the patient becomes ambulatory, a supporting corset or girdle is applied before arising, and worn when in the erect position to overcome the traction of the mesenteric pedicle and of the stomach.

Phenobarbital or bromids should be employed, and liquid petrolatum and agar used for constipation.

A small group of patients may not respond to such medical and postural measures. They usually show subsequent roentgenological evidence of duodenal stenosis, either from obstruction at the duodenojejunal angle, or duodenal fixation from adhesions, with gastric retention. In these patients conservative surgical measures will bring relief, such as division of constricting bands to the duodenum, or separation of adhesions of the mesentery in the pelvis, or suspension of the cecum and ascending colon or, where the cause of the mesenteric compression cannot be discovered, duodenojejunostomy. The postoperative care of these patients is important, with the employment of suitable diet, massage, postural treatment, and an abdominal belt during convalescence.

SUMMARY

The recognition of a clinical entity of chronic duodenal stasis thirty years ago was intimately associated with the recognition and treatment of acute dilatation of the stomach.

Compression of the third portion of the duodenum by traction on the mesentery containing the superior mesenteric vessels is a frequent cause of chronic duodenal stasis.

Symptoms of toxicity of the duodenal contents, lassitude, malaise, neuralgic pains, vertigo, and intense headaches may be paramount to the general symptoms of abdominal discomfort, indigestion, flatulency, vomiting, and constipation. When certain of these neurological symptoms are prominent, the picture may suggest migraine, atypical neuralgia, or even brain tumor.

Bilious attacks, with copious vomitus containing bile and pancreatic secretions, associated with headache and constipation, in an asthenic individual suggest chronic duodenal stasis.

The diagnosis is confirmed by roentgenological studies that reveal active peristalsis and antiperistalsis in a dilated duodenum.

The majority of cases will respond to medical and postural treatment, which include rest in a bed with its foot elevated one to two feet, frequent lateral and prone positions, the knee-chest posture for fifteen minutes after each meal, high caloric, high vitamin bland food taken every two to four hours, exercises to strengthen the abdominal wall, and the application of a supporting belt (which must be put on while the patient is in a recumbent position) when ambulatory.

Conservative surgical measures, as the last resort, include division of bands and adhesions, fixation of a mobile colon, or duodenojejunostomy.

DISCUSSION

Nelson J. Howard, M. D. (2957 Divisadero Street, San Francisco).—We are indebted to Doctor Reichert for his review of the anatomical and physiological factors producing occlusion of the third part of the duodenum through extraduodenal pressure. The symptom-complex of periodic severe headache, followed by copious vomiting usually of bile-stained material, deserves the reëmphasis given by Doctor Reichert. Awareness of this syndrome, and the

possibility of chronic duodenal stasis, will help the physician solve diagnostic difficulties, and with the conservative treatment outlined, the patients may be spared years of discomfort and ill health.

One personal experience:

Miss M. H. suffered for seven years from headache and insomnia. She was under treatment in the Stanford Clinic and had her teeth extracted, a nasal septum operation, glasses corrected, without relief. Laboratory investigation revealed no abnormal findings. Spinal puncture showed no increased pressure or pathological changes in the fluid. X-rays finally revealed what was interpreted as a large diverticulum of the second portion of the duodenum. By this time the patient had developed vomiting; severe, constant abdominal pain, and tenderness. Operation showed a duodenal stasis from encirclement of the duodenum by an annular pancreas.

Particularly is Doctor Reichert to be commended for showing us the effectiveness of simple conservative measures in most cases of chronic duodenal stasis.

*

John Homer Woolsey, M.D. (Woodland Clinic, Woodland).—Chronic duodenal stasis is without doubt a clinical entity. It has been in the past recognized more often by a process of elimination than by direct diagnosis; but with the symptomatology better understood, it will become a condition more often thought of and, therefore, should be more promptly diagnosed. It is by the x-ray in competent hands that these clinical entities are being definitely demonstrated, and then proper treatment instituted. It follows, therefore, that the rule—that any patient with a gastro-intestinal complaint which does not respond to treatment under three weeks of proper and adequate diet and rest should have an adequate study of the gastro-intestinal tract by a competent roentgenologist—is most worth while.

As regards treatment, I am heartily in accord with conservative, or dietary and postural measures. Surgery should be employed only for the very severe or obdurate cases, and in those instances where a definite localized block more amenable to surgical correction has been demonstrated.

Duodenojejunostomy, performed according to the method without clamps, and with the mesocolon stitched well back on the duodenum, will, I believe, give a good result; but duodenojejunostomy as done, has not, from my observation, afforded the relief expected and desired.

EAR MANIFESTATIONS FOLLOWING HEAD INJURIES*

By Frank Hand, M.D.
San Francisco

Discussion *by Harold A. Fletcher, M.D., San Francisco; Ben L. Bryant, M.D., Los Angeles; William J. Mellinger, M.D., Santa Barbara.*

INJURIES to the head are of interest to otologists, because many of them affect the ear mechanism in one or both of its divisions. It has been my observation that the severity of the injury often bears no relation to the development of cochlear or vestibular symptoms.

DIMINISHED HEARING

The most common ear symptom encountered following head injuries is a nerve deafness characterized by a decrease in hearing for high tones. The next symptom in order of frequency is labyrinthine vertigo, which is manifested by dizziness and aggravated by quick head movements.

Diminished hearing can easily be demonstrated by means of a careful hearing examination. The addition of the audiometer to our equipment has now greatly simplified this procedure, as well as given us a better record of hearing losses than we were able to obtain by the older methods. I might add also that a malingerer, claiming a hearing loss, may now be more easily detected by repeating this test several times. In a series of hundreds of audiometer tests repeated on coöperative patients, I have found that the readings will not vary more than 2 or 3 per cent.

LABYRINTHINE SYMPTOMS

The presence of labyrinthine symptoms may be demonstrated by quick head movements, or by the more accurate caloric and turning tests. Fortunately for the examiner in some insurance cases, the symptom of nystagmus is independent of the will and it is impossible for a malingerer to stimulate nystagmus.

In testing for labyrinthine symptoms the examiner must remember that these symptoms may be caused by other conditions than head injuries. He may encounter this symptom-complex in patients suffering from syphilis, also in patients with nicotin, alcohol, lead or carbon monoxid poisoning. Toxic labyrinthitis may develop secondary to a focal infection, and labyrinthine symptoms may appear as a manifestation of menopause. When any of these conditions are present, a hearing examination will often reveal the added symptom of nerve deafness.

THREE TYPES OF HEAD INJURIES

Three types of head injuries may produce a hearing loss and labyrinthine symptoms: First, concussion of the brain without skull fracture. Second, concussion of the brain with skull fracture, but not involving the petrous portion of the temporal bone. Third, concussion of the brain with skull fracture which involves the petrous portion of the temporal bone.

CONCUSSION OF THE BRAIN WITHOUT SKULL FRACTURE

Following a concussion of the brain, with or without skull fracture, we often see an increase in brain pressure. The brain substance, cerebrospinal fluid and blood vessels are all affected. The brain substance is compressed and may swell as a result of trauma. The blood vessels of the brain may become dilated and the circulation become sluggish because of a traumatic paralysis of the vasoconstrictor center. Exudate and lymphocytes may go out from the blood vessels into the brain substance. This circulation phenomena may persist after injury, and may be characterized by a concussion neurosis, namely, vasomotor instability, irregular pulse, and poor memory.

If the lateral ventricles are compressed, cerebrospinal fluid is forced into the third ventricle, then through the aqueduct of Sylvius into the fourth ventricle. The increased pressure on the floor of the fourth ventricle may affect the nuclei of the auditory nerve situated there. Degenerative changes may take place in these nuclei causing ear symptoms.

* Read before the Eye, Ear, Nose and Throat Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

An artery from the brain supplies the inner ear. The same sluggish circulation, which is present in the brain following concussion, is also present in the labyrinth. Exudate and lymphocytes may go into the labyrinth the same as into the brain substance. This condition is called serus labyrinthitis, and is produced by vasomotor changes and not by infection. The swelling of the brain substance and increased intracranial pressure may cause pressure on the internal auditory meatus. It also causes pressure on the ductus endolymphaticus, located on the posterior surface of the petrous pyramid, resulting in an increased intralabyrinthine pressure.

It appears, therefore, that ear symptoms, following a concussion of the brain, with or without skull fracture, may be caused by degenerative changes in the ear nuclei on the floor of the fourth ventricle; to sluggish circulation in the labyrinth, with the formation of exudate and lymphocytic infiltration, or to an increased intralabyrinthine pressure.

WITH PETROUS INVOLVEMENT

In the case of a fracture through the petrous portion of the temporal bone, additional symptoms may be encountered. These symptoms will depend on whether or not the fracture is of the longitudinal or crossing type. The typical longitudinal fracture starts in the region of the tegmen and progresses to the roof of the eustachian tube. It is the common middle-ear fracture, and is often combined with fractures in the middle and anterior fossae. This fracture is linear in the majority of cases, and if it has branches they usually extend into the mastoid process or into the superior wall of the bony external canal. The inner ear is not involved. The membrana tympani is ruptured in about 90 per cent of these cases. Blood is usually seen in the external ear canal, and it may be accompanied by cerebrospinal fluid. A step may be seen in the superior wall of the ear canal, and the drum looks black due to the blood in the middle ear. X-ray findings are helpful, if positive, but in some cases the fracture is so fine it cannot be demonstrated. No attempt should be made to clean the blood from the ear canal immediately after a fracture, or to do a careful ear examination, for fear of introducing infection into the middle ear. A piece of sterile cotton should be placed in the ear canal and the patient watched for evidence of beginning middle-ear infection, in addition to other general measures.

Crossing fractures of the temporal bone usually start in the region of the jugular bulb, cross the pyramid and end on its anterior surface. They are often combined with fractures of the posterior fossae. In this type of fracture the vestibule is completely destroyed and the facial nerve is usually involved. The middle ear may or may not be affected. The fracture may extend between the oval and round windows, permitting the introduction of infection from the eustachian tube into the meninges. The drum is usually normal. This fracture is easier to demonstrate on an x-ray film than a longitudinal one. These patients usually die; but should they live they will have a total loss of hearing on the affected side. There is danger of meningitis developing during the remainder of the patient's life, as these fractures do not heal by bony union, but by the formation of connective tissue.

Should a patient have a chronic running ear with bone involvement at the time of the fracture, or develop an acute otitis media with temperature, a radical mastoidectomy should be done at once to lessen the danger of meningitis. A simple mastoidectomy would be worse than useless, as it would not give sufficient drainage.

COMMENT ON CASES

The following are my findings in sixty-seven patients complaining of ear symptoms following head injuries. The most common finding was impaired hearing, which was found in 58 per cent of my patients. The next finding, in order of frequency, was vertigo of labyrinthine origin, which was found in 37 per cent. Nineteen per cent of my series complained of tinnitus. Some of this group complained of a single symptom, although quite a number of them complained of all three. Five of my patients were malingerers.

The technique of vestibular and hearing tests is quite well established. Anyone unfamiliar with these tests can acquaint himself with them by a study of any text on this subject, and a small amount of practice. The interpretation of findings is the most difficult part of this procedure. A good history, taken by the examiner himself, will be found most helpful. I always inquire whether or not the patient was unconscious and, if so, for how long. The patient's memory for events immediately subsequent to the accident will give the examiner some idea as to the severity of the injury. A history of bleeding from the nose will make one suspect a fracture through the anterior fossae, and a history of bleeding from the ears will suggest a linear fracture through the middle fossae. The time which has elapsed since the injury is of the utmost importance in the interpretation of findings and at arriving at a prognosis. The age of the patient is a definite factor. If the patient complains of vertigo, it is important that the examiner have him tell in his own words the exact type of vertigo. Unless a turning or rotary vertigo is complained of, we may suspect that it is not of labyrinthine origin.

I sense, from conversations with other physicians regarding patients suffering from head injuries, that a common false opinion prevails, namely, that unless a hyperirritability of the labyrinth can be demonstrated by means of caloric and turning tests, the patient is a malingerer. They are unaware of the fact that the important point for consideration is not whether the patient has a hyperirritability of the labyrinth, but whether or not there is a difference in the irritability of the two sides. Grove concludes that a decompensation between the two labyrinths, or a decompensation between the two central nuclei, or both, may be responsible for vertigo, which conforms with my experience.

LABYRINTHINE TESTS VARY

I have found that labyrinth tests done soon after a head injury will show a hyperirritability of the labyrinth on one or both sides. The same patient, examined several months later, will more often than not show a hypoirritability of the labyrinth,

but may complain of vertigo as much as when a hyperirritability of the labyrinth could be demonstrated. Brunner contends that in case of damage to the vestibular region, or to the conducting nerves, there is never more than a transitory irritability. He further maintains that any anatomical damage in these regions would cause a decrease rather than an increase in function.

Grove, in his study of three hundred cases of head injuries, concludes that a difference in the irritability of the two sides is of far greater importance in the production of vertigo than hyper- or hypoirritability. He also states that one sign of traumatic vestibular disease is an unequal response to an equal stimulation of the two ears; a disturbance based on a lower irritability of the injured side.

PLACE OF THE OTOLOGIST IN HEAD INJURIES

I believe that patients should be seen by an otologist as soon as practical after a head injury. Furthermore, they should be examined at regular intervals if one expects a true concept of the relationship of trauma to the patient's condition. Hyperirritability of the labyrinth is much easier to demonstrate by labyrinth tests than is a relatively small difference in the irritability of the two sides after a previously hyperirritable labyrinth has become hypoirritable. Unfortunately for the otologist and the patient, these people are usually not seen for labyrinth examinations until several months after the head injury.

Vertigo is so disabling that compensation patients incapacitated by this condition must be regarded as having a degree of permanent disability, for we have no satisfactory treatment for this condition. The vertigo may even become worse in patients with arteriosclerosis. In two of my patients it was so severe and the tinnitus so annoying that it was necessary to have a neurosurgeon cut the eighth nerve for relief.

Loss of hearing for low tones, due to damage in the middle ear, will show some improvement after the absorption of the blood-clot. However, these patients often have some hearing loss due to the development of a chronic adhesive process. Hearing loss in the uppter-tone range is usually due to damage to the basal coil of the cochlea, and is apt to remain permanent or even grow worse in time.

IN CONCLUSION

Summarizing, I find:

1. The most common ear symptom following head injuries is a nerve deafness characterized by a loss of hearing for high tones. The next symptom in the order of frequency is labyrinthine vertigo, which is manifested by dizziness and aggravated by quick head movements.

2. Ear symptoms following head injuries may be caused by degenerative changes in the ear nuclei; to sluggish circulation in the labyrinth or to increased intralabyrinthine pressure.

3. The technique of hearing and labyrinth testing is comparatively simple, but the interpretation of these findings is much more difficult.

4. Hyperirritability of the labyrinth is frequently followed by hypoirritability of the affected side. This is much more difficult to determine than the previously existing hyperirritability.

5. Patients with head injuries should be seen by an otologist as soon as practical after the injury and again at regular intervals if one expects to arrive at a true concept of the relationship of trauma to the patient's symptoms.

6. The findings from vestibular and hearing tests should be more generally used following head injuries. They are often helpful in determining the degree of disability, as well as whether the symptoms are on an organic or functional basis.

490 Post Street.

DISCUSSION

Harold A. Fletcher, M.D. (490 Post Street, San Francisco).—The subject of ear manifestations following head injury is one of great interest to the otologist. Since the formation of the Industrial Accident Commission, head injuries following industrial mishaps have come under much more complete study and care. With the tremendous number of injuries involving the skull and brain, as met with in automobile accidents, further extensive studies have been brought to the brain surgeon. The otologist, in many instances, is able to throw light on obscure points in many of these patients. In many cases both hearings before the Industrial Accident Commission as well as expert testimony in the matter of public liability damage suits, it has become necessary for the otologist to be able to diagnose, analyze, and be able to testify as to his findings. Because of the widespread distribution of both the cochlea and the vestibular nerves in the brain, as well as the importance of the peripheral end-organ findings, many of these cases need careful examination and judgment of the otologist in order to clarify their condition.

From the standpoint of loss of hearing, as Doctor Hand states, most of these head-injury cases which have ear symptoms have, also, loss of hearing of the internal ear or nerve-deafness type. Many times, however, a diagnosis of nerve impairment is made through a definite loss of bone conduction, which is brought out by a test. It must not be forgotten, in this respect, that loss of bone conduction may be present because of a fracture of the skull rather than from a nerve impairment. Without any impairment of hearing at all in most cases of skull fracture, there is a more or less permanent reduction of the bone conduction, which is often marked. It is often very difficult to state whether the loss of hearing is secondary to the injury, or whether it was a progressive form of impairment. Careful study and careful history taking, and careful judgment only on the part of the examiner, will clear up these factors.

The symptom of vertigo in these head-injury cases is one of intense interest, particularly for the otologist who is capable of making a proper vestibular examination, and who is able properly to analyze his findings. Vertigo is a very common symptom following any head injury. This symptom may be a true vertigo, with a definite organic disturbance as its foundation. In the majority of head-injury cases, however, the symptom of vertigo is not a true vertigo, but comes under the head of a functional disturbance, and has no organic lesion behind it. It is the duty and the responsibility of the otologist to distinguish between these two forms. It is of greatest importance that this distinction be correctly made, as in the case of the organic lesion with its symptoms of a true vertigo secondary to intracranial disturbances the vertigo will probably last over a long period of time, and often permanently, and will, therefore, create a definite long-lasting or permanent disability of a fairly high rating. If, on the other hand, the vertigo complained of is shown to be a functional affair with no organic disturbance behind it, these cases come under the heading of a post-traumatic neurosis when the treatment is entirely different, and the symptoms clear up after a few months to a year or slightly more, other things being equal.

The purpose of the otological examination, or rather the neuro-otological examination in this case, is to determine whether we are dealing with a normally reacting labyrinth or not. If the labyrinthine tests show a normally functioning labyrinth, we are safe in assuming that there has been no organic destruction and no organic trouble of

the labyrinth or along the labyrinthine pathways. If the tests show an abnormally functioning labyrinthine apparatus, it is necessary to determine whether the trouble is in the peripheral end-organ, or whether it is of a central nature, along the intracranial pathways. If the trouble is of a peripheral nature, the condition is usually of more or less short duration, and compensation and readjustment take place within a reasonable length of time. If, on the other hand, tests show an intracranial organic involvement of the labyrinthine pathways, the duration will be of a much greater length of time, and probably permanent.

I cannot agree with Doctor Hand that the vestibular examination is one easily and quickly learned from the textbooks. Among the many otologists of my acquaintance, I have found only a very few who are in any way capable of making these tests correctly or interpret them intelligently. There is a wide variation of normal responses, knowledge of which must be obtained through practice and observation. The reflex reactions from both turning and caloric tests are very complicated, and if there is a wide variation of normal in the simple knee-jerks, how much more variation within normal limits might we expect to find in such a complication of reflexes from the various parts of the labyrinth. Doctor Hand is certainly correct in saying that the interpretation of abnormal findings is difficult. Only careful studies of the normal, and knowledge of the labyrinthine apparatus, both as the peripheral end-organ as well as the intracranial pathways, are fundamental in making interpretations of the test. When one adds to this the many different pathological conditions which can influence both the peripheral end-organ as well as the intracranial pathways, great care and study is necessary to properly evaluate one's findings. To me the study of labyrinthine reactions, both normal as well as pathological, have been the most interesting and stimulating of all of my ear work; and particularly interesting have been the cases of head injuries, both those who have been recently injured and those who were injured months or years previously, yet who still have symptoms or vertigo.

❦

Ben L. Bryant, M. D. (2007 Wilshire Boulevard, Los Angeles).—From a medico-legal aspect, the otologist is concerned with no question more frequently than that of subjective symptoms following a head injury, and yet far too seldom is he permitted to see the patient early enough after the injury, and to follow the course of events long enough and with sufficient regularity of examination, to enable him to express an intelligent and dependable opinion. Hence, a paper such as Doctor Hand's, with certain of the points which he has presented, is timely and engaging.

It occurs to me that, although the scope of this paper does not include a consideration of the damage done to the ear by the accidental or intentional introduction of hot liquids or chemicals, there should be some mention made of injury by mechanical agents, such as sudden changes in air pressure. This condition is seen in linemen subjected to an electric "flash," and in caisson workers, divers, and occasionally in aviators. Since the symptoms in these cases are the result of extravasation of transudate and blood into the tympanum and labyrinth (and sometimes even by gas emboli from the blood being deposited there), they have some aspects in common with the type of cases under discussion.

In the actual concussion cases, the importance of examining the patient as soon as possible was emphasized even by Politzer, who wrote on this subject before the physiology and pathology of the areas in question were understood as well as they are at present, and it has been reiterated by many writers since. He counseled further against giving a definite opinion too early, because of the apparent paradoxes, for at times an individual who seems to be very badly injured will make a surprisingly rapid and complete recovery, whereas another who seems to have only a slight injury will subsequently develop symptoms which are more and more marked. It is always necessary to utilize every source to determine the patient's condition and state of health previous to the accident, and particularly whether any cochlear or vestibular symptoms had ever been present.

H. Beyer, in a recent article in the *Zeitschrift für Hals-Nasen- und Ohrenheilkunde*, in discussing concussions of the head, elaborates on the subsequent disturbances of the eye muscles which he feels are often overlooked in a consideration of the vestibular symptoms. He cites a number of instances in which he feels that the patient's visual symptoms were due to the inequality in speed and extent of the movements of the two eyes. His patients had marked vasomotor symptoms. He describes, as have others, a variety of findings that are similar to those found in tumors of the pons and medulla, and concludes that they are due to circulatory changes in the brain stem, in the form of alternating spasms and dilatations of the vessels.

These conclusions concur with a part of those previously reached by Linthicum, whose work on this subject has done much to clear the mist that for so long surrounded it. Linthicum's careful and exhaustive study of a series of concussion cases brought him to emphasize particularly that the injury was to the inner ear and the intracranial pathways, or to these pathways alone, convincing evidence being found in the anomalies noted between past-pointing and nystagmus, between postural vertigo and nystagmus, between the severity of symptoms and spontaneous phenomena, between vestibular derangement and auditory function, and between spontaneous vertigo and induced vertigo. Abnormalities in the past-pointing reactions were the most constant findings.

Although Linthicum was not able to group the postconcussional labyrinthine findings into a definite symptom-complex, he did find that disturbances of equilibrium arising in the end-organ are more apt to readjust themselves than those of central origin, and, therefore, he has given us a further aid to prognosis, if we can determine, when we examine the patient, whether peripheral or central involvement is preponderant.

No longer can crude and superficial tests be accepted as sufficient in these cases, particularly when the question of compensation and insurance is so often in the foreground, and we have come to realize that no postconcussional patient can be dismissed as neurotic or as a malingerer until he has been subjected to careful neuro-otologic tests.

❦

William J. Mellinger, M.D. (1725 State Street, Santa Barbara).—This most timely paper suggests to me for discussion our responsibility as medical men in the determination of the degree of damage in patients with head injuries. The extent and location of the physical injury and the surgical management of the cases are, I believe, very well understood, but I am quite sure that the psychic and neurological phases of the problem are sadly neglected. Many patients are insurance cases, and settlements are made following the testimony of physicians who are not aware of or at least do not take into account the possibility of delayed effects resulting from infection, and trauma of the brain and the sense organs. These delayed effects may manifest themselves in altered mental behavior of serious consequence, and a failure to consider this possibility may result in gross injustice to the patients involved. The legal profession seems intent upon getting quick settlements for clients in accident cases and may not be so earnestly determined to secure justice for all concerned. The injured are often unable to secure proper legal advice and competent expert testimony. Expert testimony may not always be based upon careful study and analysis of the cases under consideration, and may overlook entirely possible developments which may occur within the next few weeks or months. An annoying tinnitus, a persistent headache or ocular disturbances may be accompanied by, or even produce, certain neuroses resulting in mental deterioration which may eventually reduce a useful citizen to a state of invalidism or even to being a public charge. I would, therefore, plead for a more careful neurological study of patients with head injuries, and urge that more careful records be kept over more extended periods of time. These would enable us in the future to be better qualified to pass judgment on the probable consequences of head injuries.

The author calls attention to the fact that transverse fractures of the pyramid of the temporal bone always involve the labyrinth and may result in defects in hearing and vertigo; and that the fracture never heals by bony union, so that the patient is in great danger of cranial involvement for the rest of his life, particularly in the event of an upper respiratory infection. This should always be borne in mind in estimating the probable results of head injuries involving the pyramid of the temporal bone, and the patients involved should be made aware of the possibilities and instructed to take the necessary precautions to prevent, so far as possible, upper respiratory infections.

ANOMALIES OF THE SPINE*

A CORRELATION OF ANATOMICAL, ROENTGENOLOGICAL, AND CLINICAL FINDINGS

By Wilbur Bailey, M.D.
AND
Ray A. Carter, M.D.
Los Angeles

Discussion *by Paul E. McMaster, M. D., Los Angeles; Harold E. Crowe, M. D., Los Angeles.*

FROM an anatomical standpoint the spine is such an exceedingly complicated structure, and consists of so many individual parts, that one might almost expect to find abnormalities of development as the rule rather than the exception. As a matter of fact, as many as 67 per cent of spines do show some such variations.

Since abnormalities are so frequent and of so many varieties, it is of considerable importance, from a clinical standpoint, to know which types may be properly regarded as likely to produce symptoms, and which types may safely be considered as without clinical significance. Of equal interest is the fact that certain anomalies may present an appearance which must be differentiated from old or recent injury.

DEVELOPMENT

Since all anomalies are directly traceable to developmental errors, a brief recapitulation of this process is in order. This discussion may begin at the embryonic period in which the neural canal and notochord have formed, and the mesoderm is dividing transversely to form the somites. The mesoderm by this time has differentiated so that a mesodermal paraxial mass lies on each side of the neural canal and notochord. This structure will form the future spine. Guided by dorsal intersegmental arteries, the paraxial and adjacent mesodermal masses divide transversely into segmental blocks, or somites. The blocks so formed are called the scleratomes, and are the anlage of the vertebrae. Segments are laid down for the three fused vertebrae which form the occipital bone, as are seven cervical, twelve dorsal, five lumbar and five sacral, and eight to ten caudal vertebrae. The caudal segments later degenerate, three or four coccygeal segments remaining. Variations in the number of vertebrae arise at the stage of somite division, or later by variations in the number of caudal vertebrae which degenerate.

However, a vertebra is not developed within the somite. A change occurs by which sclerotomes of two adjacent somites participate in the formation of a vertebra, and by which it thus comes to be located opposite an intersegmental septum, rather than in the somite itself. Appreciation of this point is necessary to comprehend certain anomalies and to understand the relation of the vertebra, with its processes and ribs, to the muscular structures.

Each sclerotome divides transversely into a caudal dense, and a cranial looser portion. These separate and reunite with the adjacent portion of the neighboring sclerotome. In this process the intersegmental arteries, which originally lay between adjacent sclerotomes, now come to lie within them, as is shown diagrammatically in Fig. 1.

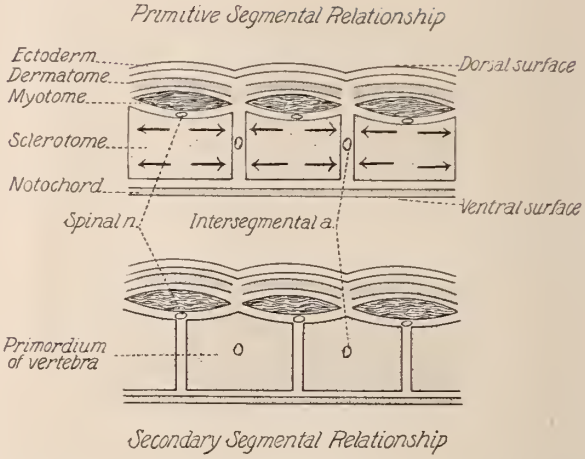

Fig. 1.—Fusion of adjacent halves of the sclerotome (as indicated by arrows), encloses the intersegmental artery within the future vertebra and brings the vertebral body opposite an intersegmental septum.

By growing to enfold the neural tube and notochord, the paired sclerotomes form the vertebrae. The neural or dorsal processes grow dorsally about the neural tube to form the neural arch. Paired medial processes enfold the notochord to become the body. Ventrolateral processes form from the costal processes. Secondary buds from the neural processes form the transverse and articular processes. Loose mesodermal tissue, not incorporated in the sclerotome, forms the intervertebral disc. The notochord in the center of the disc persists as the nucleus pulposus. Within the vertebral body it disappears. The costal processes, transverse processes, and ribs grow from the sclerotomes into the intersegmental septa, lying between adjacent somites.

The foregoing description concerns the membranous or blastemal stage of development. Varied deformities may be caused by injurious influences at this period. Nondevelopment of the neural bow will result in spina bifida. Inhibition of a ventral process will produce hemivertebra and absence of corresponding processes and ribs. Disturbances of the division, and recombination of the sclerotomes, may result in various irregularities, including unilateral supernumerary segments, or an alternation of segments in which hemivertebrae on one side lie opposite an intervertebral disc on the other. There may be associated fusion of ribs. The aberrations may be numerous and the pattern of development very disorderly. Gross deformity, particularly scoliosis, may be produced, or the multiple defects may compensate each other quite well, as in Fig. 2. More or less complete fusion of two or more vertebrae may occur. This may be related to the fact (Bardeen [1]) that at one period the mesodermal anlage of the intervertebral disc is very thin. (See Fig. 3.)

During the second, or chondrogenous stage of development, the original blastemal structures are transformed to cartilage. At this period the vertebral bows meet to complete the neural arch. Failure of development at this stage results in spina bifida.

* Read before the Industrial Medicine and Surgery Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

Fig. 2

Fig. 3

Fig. 2.—Infant spine showing multiple developmental abnormalities, including hemivertebrae, fused vertebrae, and divided vertebral bodies. (The latter result from failure of fusion of the two centers of ossification in the body.) Numerous rib anomalies are present.

Fig. 3.—Fused vertebrae. The third and fourth cervical vertebral bodies are fused together, only faint evidence of an intervertebral disc being present. The complete fusion of the spinous processes indicates a developmental etiology.

The third, or osseous, stage of development is initiated by the appearance of centers of ossification. One forms in each neural arch and two in the body. These latter normally fuse quickly, but may remain separate so that the body ossifies from two centers. We have one case (Fig. 2) in which these centers failed to fuse, the vertebral body remaining as two separate lateral halves. Similarly, one lateral half of a body may fail to ossify and, therefore, remain cartilaginous.

The neural arch of the fifth lumbar vertebra may ossify from two centers, the cartilaginous interval lying between the superior and inferior articular processes. This weakness may permit separation, allowing the body to slide forward without support, producing spondylolisthesis.

Nothing has been said about the chronology of these stages of development, since its details are not material to this presentation. The osseous phase begins about the seventh week and prolongs itself through adolescence, so that variations of it may occur until there is complete osseous maturity. The blastemal phase begins in the earliest weeks of pregnancy with the appearance of the sclerotomes. The chondrogenous phase begins in the sixth week, and the cartilaginous neural bow is complete in the fourth month. There is thus much overlapping of the stages of development.

FUSED VERTEBRAE AND HEMIVERTEBRAE

The development of these types of anomalies has just been considered. These defects may occur at any level. In the cervical region they may be present in combination with complete absence of some segments in the neck in the so-called Klippel-Feil syndrome. Hemivertebrae often produce a marked scoliosis. The diagnosis is easily made by a radiographic examination, and there is a general agreement that such a scoliosis may produce symptoms. With the exception of small supernumerary segments it is not likely that hemivertebrae would be mistaken for fracture, and the main interest, therefore, lies in the presumably weak anatomic structure which they cause.

Fused vertebrae may have an appearance suggesting an extinct disease process which has destroyed the intervertebral disc or an old injury. Often the normal stature of the bodies or the complete coalescence of some portion, such as the spinous process, as in Fig. 3, will make possible a differential diagnosis.

SPINA BIFIDA

Failure of fusion of the spinous processes is particularly common in the lumbar and sacral regions. Unless accompanied by an actual protrusion of the soft tissues, this finding is generally considered as not significant. Cushway and Maier [2] found 156 instances of spina bifida occulta in examining the backs of 916 supposedly normal men who were applying for railroad work, and we find the incidence equally high. We are in accord with the general agreement in the literature that there is no practical or theoretical reason why minor variations or actual failure of fusion of the spinous

processes in this region should be productive of symptoms.

SPONDYLOLISTHESIS

As mentioned earlier, the primitive neural arch of the fifth lumbar vertebra occasionally ossifies in two centers instead of one. Under such circumstances, the cartilaginous interval or "isthmus" lies between the superior and inferior articular processes.

The vertebral bodies in the lumbar region are subjected to an unusual shearing stress because of their position at the weight-bearing lower end of the spine. This stress tends to make the bodies slip ventrally. Ordinarily this ventral movement is checked by the inferior articular and spinous processes. When the structure connecting these processes with the remainder of the body gives way, however, which may readily happen if it is only cartilaginous, spondylolisthesis may occur.

Out of thirty-eight cases picked at random from our material, in two the spondylolisthesis was between the fourth and fifth lumbar vertebrae instead of at the usual location, between the fifth lumbar and first sacral bodies. In these cases the separation at the "isthmus" was not so clearly seen. It is to be hoped, with the recent improvements in equipment, that six- and nine-foot lateral films will be possible. These should greatly reduce magnification and improve detail in the lumbosacral region.

TRANSITIONAL VERTEBRAE

The formation of the normal number of seven cervical, twelve thoracic, five lumbar, five sacral, and four coccygeal segments has been discussed. Variations from this formula occur in about 20 per cent of skeletons. At occipito-cervical, the cervicothoracic, thoracolumbar, and lumbosacral junction, the so-called transitional vertebrae occasionally appear, which share some of the characteristics of both groups.

The seventh cervical vertebra, for instance, may show ribs of varying lengths articulating with or, more usually, actually fused with its transverse processes. There is no doubt that cervical ribs, even when partly fibrous, may produce very definite symptoms in the upper extremities because of pressure on the brachial plexus. The great majority of the cervical ribs which come to our attention, however, are discovered as incidental findings, no symptoms referable to them being present. On the contrary, when cervical rib is suspected clinically, only in about one out of ten times is this anomaly actually found.

At the dorsolumbar junction, the twelfth dorsal vertebra may have such short ribs, or the first lumbar vertebra may have such well-developed ribs, that it will be hard to differentiate between the first lumbar and last thoracic vertebra. Under such circumstances, or when a similar question arises in the lumbosacral region, the differentiation can generally be made, when important, by examining the entire spine.

Lumbar ribs occur in about 10 per cent of spines, and sometimes cannot be distinguished from persistent epiphyses opposite the transverse processes. It is much more important, however, to differentiate these two anomalies from fracture than from each other. Any lumbar segments may show such anomalies.

The lumbosacral transitional vertebrae are characterized by the occurrence of enlarged transverse processes (the so-called costotransverse processes) on one or both sides. (See Fig. 4.)

These enlarged transverse processes may not be sufficiently large to reach either the sacrum or the ilium, but at times they articulate with the sacrum or even the ilium on one or both sides. Sometimes there is actually unilateral or bilateral fusion of these processes with the sacrum. In deciding whether large transverse processes are in contact with the sacrum, it must be remembered that the usual anteroposterior film of this region shows it at a considerable angle. If the angle of projection be changed by flexing the patient's thighs or changing the position of the tube, the effect of overlapping may disappear, and a definite space may be seen between the large transverse process and the sacrum.

If the twenty-fourth vertebra (normally the fifth lumbar) becomes united with the sacrum by bilateral bony union, the process of sacralization is complete. This may result in a six-piece sacrum. Conversely, complete lumbarization of what is normally the first sacral segment may occur—a finding which should result in a four-piece sacrum. Actually, a segment is often lost to, or borrowed from the coccyx, so that the sacrum maintains its usual quota of five pieces. By this means the actual level of transition from lumbar to sacral spine may be anywhere from the twenty-fourth to the twenty-sixth segment.

To what extent clinical symptoms are caused by lumbosacral transitional vertebrae is a much debated point. From a physiological aspect the lumbosacral articulation serves as the junction point between the rigidly fixed pelvis and the mobile lumbar spine. From the clinical aspect the frequent occurrence of low-back pain following comparatively mild trauma indicates that the lumbosacral region is a point of decreased resistance. The point of interest here is whether congenital anomalies represent additional factors of decreased resistance.

Complete lumbarization of the first sacral vertebra lengthens the lumbar spine to six segments, and therefore allows slightly increased mobility, which would, theoretically, make the spine structurally weaker. If there are two well-formed lumbosacral transverse articulations present, because of sacralization of the last lumbar vertebra, the lumbosacral junction may be strengthened, but periarthritic changes at these transverse anomalous articulations may occur, which are said to be productive of pain. Radiographically, sclerotic reactive changes are frequently found surrounding such anomalous articulations.

The incomplete and the unilateral types of enlarged costotransverse processes, many authors agree, are occasionally the cause of low-back pain and other symptoms. Those who, on the contrary, believe these anomalies cause no symptoms argue that they have been present from birth; yet symptoms do not develop until adult life, usually in the

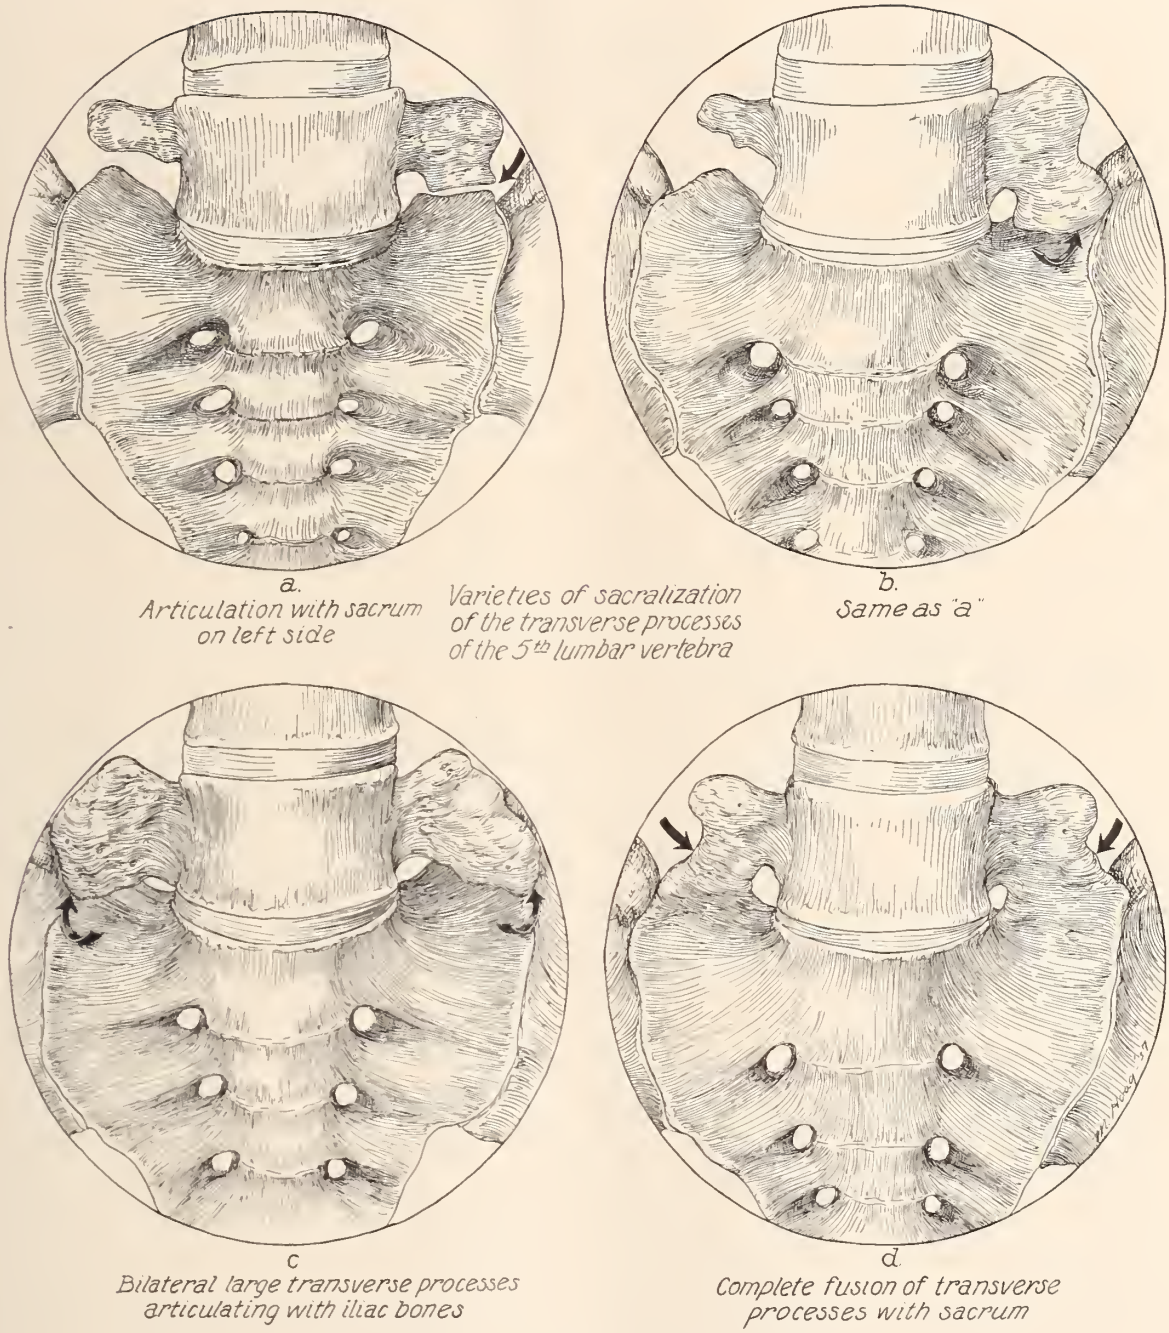

Fig. 4.—Types of lumbosacral transitional vertebrae.

third decade. Furthermore, during routine examination, the condition is found in many patients who have no symptoms. Opposing this viewpoint stand the arguments that in early life the process is mostly cartilaginous and, therefore, not likely to produce symptoms till ossified; that even though patients are found who are symptom-free, this anomaly may, nevertheless, indicate a point of weakened resistance; and that, from a mechanical standpoint, trouble might be expected. Such trouble would be caused by an enlarged process which, though not actually in contact with the sacrum, might impinge on it during lateral bending and thus nip the intervening soft tissues and periosteum.

A large unilateral process may serve as a fulcrum when motion is in its direction, so that abnormal stretching of the ligaments on the opposite side is caused. The arthritic changes (Mitchell)[3] which may be present around these anomalous joints not only produce pain themselves, but may be sufficient to involve the adjacent nerves by encroachment on the intravertebral foramina. In fact, Wagner[4] shows a number of cases in which referred pain in the lower extremities has been limited to the distribution of the lower lumbar and upper sacral nerves. He believes the cause to be directly traceable to various types of transitional lumbar vertebrae.

It seems likely that the question of whether these anomalies produce symptoms will continue to be disputed, and that the outlook of different authors will vary according to whether they have an industrial practice in which many cases of low-back

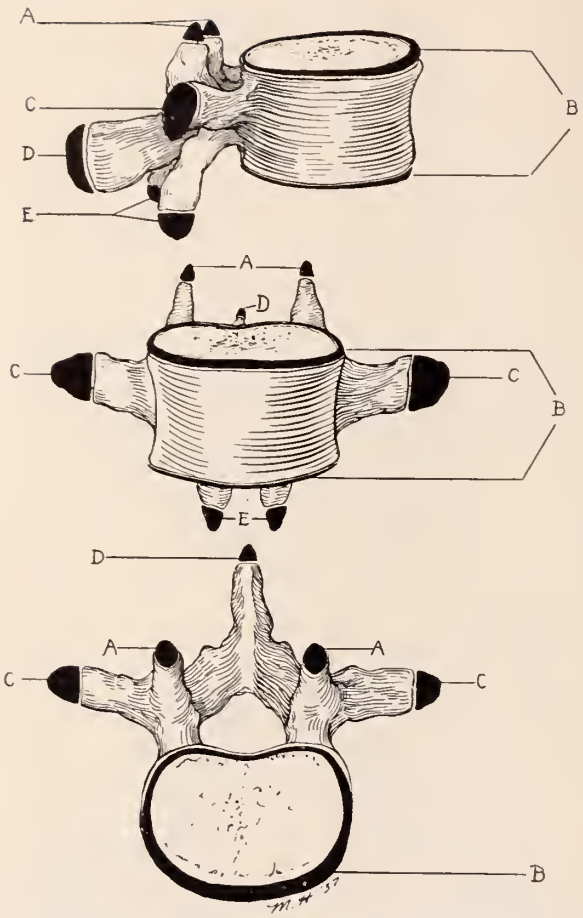

Fig. 5.—Possible locations of persistent epiphyses. (A) Superior articular processes. (B) Rim-like secondary epiphyses around vertebral body. (C) Transverse processes. (D) Spinous process. (E) Inferior articular processes.

pain are radiographed, or whether they note these anomalies incidentally in films made for examination of the urinary tract or some similar purpose.

Far more conclusive than much of the speculation which has appeared on the subject is the report of Bohart,[5] who made radiographic examinations of the entire spines of one thousand switchmen on the Belt Railway Company of Chicago. These switchmen have particularly hazardous work, which practically requires that they be trained athletes. In the year before routine examinations of the entire spine were instituted, there had been forty-seven back injuries. After the examinations were started, all persons with arthritic lipping or spur formation were not employed, but those with anatomical variations and anomalies were accepted, if the man was otherwise physically strong.

The results were astonishing. In the two and one-half years following the examinations there were only two litigations in cases of low-back pain in contrast to the forty-seven in a single year before such examinations were started. Since no anomalies of the spine had been weeded out, Bohart concludes that anomalies play no part in making men more susceptible to injury. In fact, his patients with cervical ribs were injured, but there were no complaints relative to their cervical ribs. Likewise, some of the men with spina bifida occulta

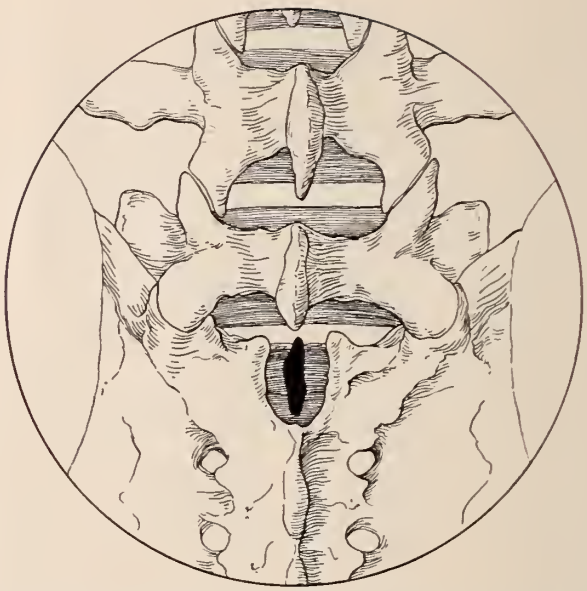

Fig. 6.—Persistent epiphysis of the spinous process of the first sacral segment. Fusion has not resulted because of a concomitant spina bifida.

and sacralized vertebrae had serious falls from the tops of freight cars moving at high speeds, but they had no complaints relative to their anomalies.

Our experience is in close accord with these findings. While we find marked osteo-arthrosis or obesity frequently associated with low-back pain, the incidence of lumbosacral transitional vertebrae is not appreciably higher in such cases than in films made for other purposes.

PERSISTENT VERTEBRAL PROCESS EPIPHYSES

While an absence or irregularity of primary centers of ossification will produce the defects just discussed, the secondary centers, or epiphyses, which frequently appear during the growth period opposite the tips of any of the vertebral processes, may fail to fuse at the usual time. The possible locations of these "persistent" epiphyses appear in Fig. 5. The ossicle which is thus formed is more than a pathological curiosity, for it may be wrongly interpreted as fracture.

Secondary epiphyses occur with regularity opposite the uppermost thoracic vertebra and, according to Gråberger,[6] a "persistent epiphysis" at this point is found in 0.7 per cent of all individuals. No diagnostic difficulties are experienced when this anomaly is bilateral, because the two sides are symmetrical. Unfortunately, from a diagnostic standpoint, unilaterality is the rule.

The spinous processes may also have small persistent ossicles opposite their tips in later life. The appearance of these epiphyses is especially strange when the spinous process has not fused properly (Spina bifida occulta), as frequently occurs with the first sacral vertebra. Under these conditions a small ossicle, about the size of the tip of a spinous process, is seen lying in the fissure between the ununited spinous process, as in Fig. 6. This ossicle is completely free from any of the surrounding bones, and is united only by soft tissue to the portions of the spinous process with which it would

normally have fused completely. Persistent spinous process epiphyses are usually distinguishable from fracture by (1) their multiplicity, (2) their location at the tip of the process instead of at the mid-portion where the structure is weakest, and (3) by the points later to be described common to all of the process anomalies.

Similar unfused centers of ossification opposite the inferior articular processes of the lumbar vertebrae are not rare, while more seldom the superior articular processes show this phenomenon. In a previous communication,[7] the literature on this subject was reviewed, and emphasis laid on the necessity for differentiation from fracture. Unlike the transverse processes, however, isolated fractures occur in the articular processes only with rarity, and are not only disabling because of the amount of pain produced, but usually have a definite antecedent history of a sudden bending or rotating motion while the spine was locked in flexion or extension.

In general, the radiographic appearance of persistent epiphyses of the vertebral processes may be differentiated from fracture because:

1. The anomalies are often bilateral or multiple. Multiple fractures may occur, but lack regularity.
2. The margins of the persistent epiphyses have a sharp cortical outline, while a typical fracture line is serrated and small comminuted fragments may be present.
3. The epiphyses are often larger or show some irregularity of shape which would not be expected in a fracture fragment.
4. Fracture fragments are nearly always displaced by ligamentary or muscle pull, and do not appear in close apposition to their base with the bone cortices completely parallel, as is the case with the anomalies.

The rim-like secondary epiphyses occasionally fail to fuse, thus leaving a triangular piece of bone at the vertebral body margin.

They can be differentiated from fractures of the vertebral margins by (1) the separation between the epiphysis and body which is occupied by space-taking epiphyseal cartilage; (2) the lack of compression of the body; (3) the absence of "offset" of the fragment; and (4) the fact that the persistent epiphysis does not change position when the spine is flexed or extended, which is almost invariably the case with a fracture fragment not in contact with the vertebral body.

SUMMARY

An attempt has been made to correlate the anatomical, roentgen, and clinical findings in the more important developmental abnormalities of the spine in an effort to show how such abnormalities can be differentiated from fracture and from which a variety of symptoms may be expected.

DISCUSSION

Paul E. McMaster, M.D. (1930 Wilshire Boulevard, Los Angeles).—The authors have discussed some important and practical points from a clinical and diagnostic standpoint. These are particularly pertinent in attempting to correlate the importance of anomalous lesions of the spine with certain symptoms. One of the features, as was pointed out, is the need to determine what effect or relationship, if any, such lesions might have to injuries, and especially those with an associated compensation factor. Quite frequently an examiner is called upon to estimate disability of spinal injuries in which cases roentgenograms reveal anomalies. Are these causative of the symptoms? Are they producing a prolongation of symptoms? The authors called attention to the fact that many of these lesions without symptoms are discovered, incidentally, to routine examinations. Thus, care should be exercised against indiscriminately attributing symptoms to an anomalous condition in the spine, unless other pathological conditions are ruled out first.

Congenitally fused vertebrae cause, as a rule, no significant symptoms. Hemivertebrae often give rise to scoliosis, which may be well compensated and without symptoms. Attempts have been made to remove these with variable success, due probably to technical difficulties. A spinal fusion would appear to be more feasible in the presence of symptoms.

Simple spina bifida occulta without herniation is not uncommonly encountered, and usually causes no symptoms.

Spondylolisthesis results from a congenital maldevelopment and frequently may produce low-back pain with an associated sciatic distribution often appearing after either a single severe or repeated minor injuries. Although an injury may be contributory in precepitating these symptoms, it is problematical as to how much importance an examiner is to place on the injury and how much on the congenital malformation, particularly in those cases with a compensation factor.

Transitional vertebrae are quite often the sites of anomalous development and, although a number of these may remain "quiescent," some, such as cervical ribs and others as abnormal transverse processes of fifth lumbar vertebrae fusing or articulating with sacrum or ilium, or both, are important in causing symptoms which at times are severe. Stereoscopic as well as oblique roentgenograms of the lumbosacral region are at times advisable, and may show an existent gap where, on routine anteroposterior views, a fusion or articulation of fifth lumbar transverse process to sacrum or ilium seemed to be present. Surgery usually offers relief in these cases.

*

Harold E. Crowe, M.D. (2417 South Hope Street, Los Angeles).—It is very frequent that areas of abnormal mobility, especially in the low-back region, will not only produce symptoms but produce changes in the bone which can be visualized by x-ray; and when these areas are seen at surgery during spinal fusion operations the abnormal motion and the sclerosing changes in the bone may be grossly visible. However, the problem of low-back conditions, like all other medical problems, is prone to be subject to waves of enthusiasm, and at the present time the tendency is to feel that the actual seat of pain in low-back conditions is in the soft tissue structures, especially ligaments and fascia associated with the skeletal low back. Since undue tension on ligamentous structures over a period of time will produce symptoms, the study of the statics of

the low-back becomes just as important as the study of the bony structure on the discovery of bone disease.

X-rays taken in the standing position, while they are often not adequate to give actual bone detail, will very frequently explain the symptoms in these cases and lead to remedial measures which produce complete relief, simply through the change of the habitual stance of the patient. Where such postural faults are found associated with skeletal anomalies, it is undoubtedly true that the symptoms are aggravated by the skeletal weakness and the two findings may work together in producing the chronic pain.

As the study of the problem of pain of this sort grows more extensive, it becomes more and more obvious that there must be many explanations of backache and that no examination is complete which overlooks the numerous possible factors in any individual case, among which the points brought out by Doctors Bailey and Carter are of extreme importance.

THE LURE OF MEDICAL HISTORY†

PURKINJE'S PIONEER SELF-EXPERIMENTS IN PSYCHOPHARMACOLOGY*

By P. J. Hanzlik, M.D.
San Francisco

PART I

INTRODUCTION

IF we agree with George Eliot that "Genius is an immense capacity for taking pains," then this definition exempts that immortal of biology and medicine whose work I propose to discuss tonight. Impatient with infinitesimal detail, intolerant of triviality, extraordinarily original, masterful interpreter of natural phenomena, unusually apt in spotting the right thing at the right time, pacemaker of experimental physiology, medicine and psychology—that was Johann Evangelista Purkinje, the scientist. Endowed with a vivid imagination, a keen philosophical mind, a prophetic vision, a tolerant spirit, a sympathetic nature, and a clear understanding of human affairs, and a man with the highest ideals who led a full and beautiful life—that was Purkinje, the man, the humanitarian, and the statesman. He was indeed unusually talented and remarkably ingenious, especially in the biological sciences.

Yet, in a recent paper (1933) on the history of physiology and physiologists, by an American physiologist,[1] Purkinje's name is barely mentioned. Purkinje is only alluded to as a contemporary with Liebig and Bunsen, as being the first to establish laboratories in anything like the modern sense. Purkinje is credited with some influence on Ludwig, who is suspected of having been affected, in planning his laboratory, by the example of Purkinje and these two noted chemists. So it is with many other physiologists—that Purkinje's name seems all but forgotten. His multitudinous activities have all but faded from the memories of scientists. Nevertheless. Purkinje was the pioneer of all modern physiology as it has developed to the present time. He was the forerunner of all great physiologists of modern times. For he antedated practically all the great experimental physiologists. To mention only a few: "Johannes Müller was just developing; Claude Bernard was six years old; Brown-Séquard and Carl Ludwig were infants; Brücke was uttering his first cry; Helmholtz and Huxley were yet unborn, when Purkinje published his thesis in 1819" (Robinson).[2] He preceded, by seventy years, Francis Galton in making use of finger-print identification; in fact, first proposed the idea scientifically. He established at Breslau, in 1839, the first laboratory of experimental physiology in Germany, and only Magendie had made previously a similar effort, in France. He originated the first course in experimental physiology in Breslau in 1824. He created, in 1850, at the age of sixty-three, another institute of physiology in Prague. Probably his best-known pupils were Valentin, Pappenheim, Czermak, Sachs, Gregr, and Fritsch. He found physiology a speculative subject and left it an experimental science.

Fig. 1.—Johann Evangelista Purkinje (1787-1869). Oil painting by Maixner.

If some physiologists are to be called the masters of physiology, it would seem appropriate to speak of Purkinje as a supermaster (Figure 1). Therefore, one reason why I propose to discuss Purkinje is that he is an undeservedly forgotten experimental physiologist. Another reason is that he is even more obscure as a pharmacologist, although he made some remarkably original experiments on himself which have never been discussed. Before considering these self-experiments, I may summarize his qualifications as an experimental biologist by citing his discoveries and achievements in biology and medicine, even at the risk of repeating some things which may be known.

†A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

PURKINJE'S BIOLOGICAL AND MEDICAL DISCOVERIES

The following is a rather categorical summary of outstanding items of Purkinje's discoveries in biology and medicine, which have been collected from various sources, but especially from a list of the original works of Purkinje in a report by Eiselt in 1850[3]:

Protoplasm: he coined the word.

Animal cell: he described it two years before Schwann, who is credited with the discovery.

Cambium: he coined the word.

Nucleus of animal egg (germinal vesicle in birds): he coined the word "nucleus."

Axone cylinder: he coined the words.

Nerve plexuses.

Corpora amylacea of brain tissue: Virchow credits him with these names.

Ganglion cells of the brain: these were named after him—"cells of Purkinje."

Muscle fibers in the heart: these were named "Purkinje fibers," after him.

Gastric glands and nature of gastric digestion.

Sweat glands and their ducts in human skin.

Stripes of volar and plantar skin surfaces (the scientific basis of dactyloscopy).

Idea of the threshold of stimulation.

Cilia in oviducts, gills, inner brain cavities, and respiratory passages, and their functional independence of the central nervous system. This work was done with Valentin, a brilliant young medical student, who later became a professor of physiology in Switzerland.

Fertilization of the ovum by the spermatozoön, that is, the mechanism of the sperm's migration toward the ovum with the aid of ciliary motion. This discovery was made also with Valentin.

Physiological optics: Purkinje's figures (Fig. 2), Purkinje's images, Purkinje's phenomenon; methods of measuring the curvature of the lens and cornea and of lighting the retina. This work attracted Goethe's attention. Purkinje's work on subjective phenomena of vision was repeated and confirmed, and much that was new found in it by E. Thomsen of Copenhagen in 1917.[13]

The microtome and microphotography were first used by him. He introduced certain histological technique, and a "phorolyt," useful in physiological demonstrations, a predecessor of the kymograph.

Physiology of speech.

Psychological phenomena: physiology of dreams, topology of senses, acoustics, "Tartini's tone," auscultation phenomena.

The following discoveries were made jointly with students working under his guidance, often published briefly under a student's name, but sometimes jointly with Purkinje:

Fertilization methods in plants.

Formation of skin of cucumber plants.

Symbiotic infusoria living in the stomach of ruminants.

Descriptions of rhizopods and nautilus.

Embryology of tadpoles.

Development of human teeth (two hard dental substances).

Photometry.

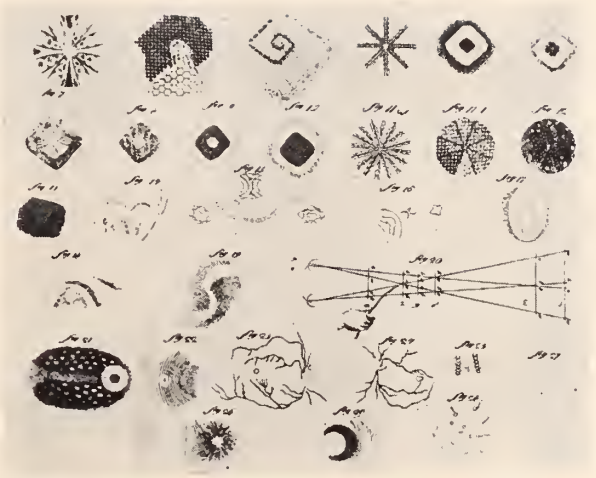

Fig. 2.—Figures in field of indirect vision: Results of pressure on eyeball and galvanic stimulation (Purkinje, 1825).

That the deaf and dumb can hear through the bones of the skull.

Production of vertigo, which paved the way for an understanding of nystagmus.

Artificial and natural digestion; influence of bile.

Original descriptions of bone, cartilage, blood vessels, and fibrillar structure of uterus.

Purkinje is also credited with being the founder of modern histology and microscopic anatomy. "The Breslau Institute was the cradle of histology" (Schrötter).

I submit that a man who could do all this in a single lifetime, making so many outstanding and original discoveries by objective experimental methods, was more than an ordinary mortal. John Stuart Mill's definition of genius would seem to be applicable to Purkinje: " . . . in its true sense, originality in thought and action." . . . But how his genius was developed is another matter. Carlyle stopped all guessing about this human attribute when he said, "Genius is ever a secret to itself."

Accordingly, Purkinje would be expected to have his feet on the ground as a psychopharmacologist. By that I mean that he would use carefully controlled and reproducible methods in testing subjective phenomena. And indeed, Purkinje was a monastic philosopher who turned from speculation to objective investigation and used himself as an experimental subject. As a teacher, he was opposed to lecturing, as against experimenting and demonstrating. That is why he developed physiology as an experimental science, a method scarcely appreciated when he appeared on the scene at Breslau. We may now turn conveniently to his self-experiments in psychopharmacology, where he observed both subjective and objective phenomena.

SELF-EXPERIMENTS IN PHARMACOLOGY

It is interesting to consider why Purkinje undertook experimental work in pharmacology. In a sense, he was a therapeutic nihilist, as he was rather skeptical of the therapeutic claims and practices of his time. He deprecated the idea that pharmacology should be only a handmaid of clinical therapeutics. He advocated physiological experimentation with therapeutic measures and remedies, so as to estab-

lish a rational basis for indications and uses of drugs, as against the guesswork of empiricism. Although he regarded pharmacology as a branch of physiology, he prophesied that some day pharmacology would achieve an independent status. Toward this he himself contributed materially by actually undertaking experiments with drugs and interpreting the results physiologically. In this he antedated, by some thirty years, Buchheim (1856), the generally accepted founder of modern experimental pharmacology. Purkinje's studies of belladonna and digitalis on the vision were published in 1823.[4] and his work on physiological pharmacology, in 1829. A part of his work in physiology and pharmacology was almost contemporary with Magendie's experimental work on the absorption of food and drugs (1816), and description of actions and uses of drugs in his *Formulary* (1821). However, Purkinje, in turn, was antedated some twenty years by Sertuerner (1803 and 1817), who made scientifically controlled animal- and self-experiments with opium and morphin, the first alkaloid to be isolated (by him) and which gave the correct explanation of the narcotic action of opium. While, of course, all this early pharmacologic experimentation was rather limited, it was done systematically and with some of the most important drugs of the therapeutic armamentarium. Pharmacologists of today may only regret that modern experimental pharmacology, so auspiciously begun by these great masters some 130 years or so ago, has not always kept pace with developments in biological science. But this has not been always the fault of pharmacologists. There are institutions today in this opulent country of ours where pharmacology is not encouraged to keep pace or develop with its sister sciences. Thus, Purkinje's fondest hopes of an independent status for this subject have not yet been realized in some of our otherwise best university medical schools. Perhaps these best schools hope for the adoption of Purkinje's method in pharmacology which, as already indicated, was self-experimentation. However, this is a kind of clinical pharmacology, which lacks a universal appeal for obvious reasons. Purkinje's reason for choosing the method of human experimentation is well appreciated by present-day pharmacologists, but the practicability of it for general adoption in teaching is seriously questioned. Even in research the method has great limitations. True, Purkinje regretted that experiments with drugs were made commonly on animals. He said that this was done somewhat according to the old dictum, *"Fiat experimentum in corpore vili,"* make the experiment on the lowly, the vile, or the criminal. However, this reveals only the objective or vegetative part of a drug's action. The surest way was by cautious experimentation on oneself. Thus, an experiment carried out *"in copore nobili"*—on a noble body—he thought, is of the greatest value, especially as to subjective reactions. Of course, Purkinje was always interested in subjective phenomena. Indeed, it has been said of him that he was always experimenting on himself, being especially interested in an idiosyncrasy of his own—that is, nausea—which sometimes lasted for days. For instance, he reported once that a mere look at a gray color, like that of emetin, caused him a sustained nausea (Eiselt, 1859). He had made extensive experiments on himself with emetin and ipecac, in which he determined the effective doses of these drugs, and the time of onset, symptoms, and seat of nausea. It has been said that medical scientists investigate their own diseases. Was nausea Purkinje's disease, hobby, or his nemesis? We shall probably never know, but it could hardly have been a recreation. However, a nauseant or emetic action did not always occur with the drugs which he examined on himself. One of these was belladonna, which I may discuss first.

EXPERIMENTS WITH BELLADONNA ON THE EYE

English writers had previously compared the actions of belladonna on the eye to presbyopia. However, Purkinje was not convinced of this analogy, since he believed the effects did not coincide. Therefore, he undertook experiments on himself, using an aqueous extract of belladonna instilled into the eye. In two hours the pupil dilated, and then, using a special viewing tube, he observed in the field of vision peculiar stellate figures, which appeared as complete stars only by divergence of rays, while in presbyopia the stars appear only by convergence. His explanation of the drug's effect on vision was based on a peculiar distribution of the light. The seat of the effects producing these stellate figures was in the lens, which, under belladonna, was more completely exposed, due to retraction (relaxation) of the iris, and flatter, due to the cycloplegia, resulting from the paralytic actions of the drug. The mydriasis resulted in considerable blinding and some pain due to too much light. The striking chromatic figures, which he also observed, were explained on the same basis, *i. e.,* the lens acted as a prism and dispersed the light. The eye under belladonna was not more sensitive to light than the normal eye; but more light entered the medicated eye, due to the mydriasis. The resultant figures and images varied with the conditions of testing the vision. The medicated eye did not see any better in the dark. Purkinje made some self-experiments with internal administration of belladonna, and recorded systemic symptoms from the drug. These will be mentioned later. His self-experiments with drugs on vision were limited, but the most interesting were those with digitalis.

DISTURBANCES OF THE VISION BY DIGITALIS

No such observations or experiments with digitalis had been made before Purkinje. His experiments are not mentioned in any of the special monographs on this drug or in textbooks on pharmacology, therapeutics, and medicine. However, exactly one hundred years after Purkinje's description of the effects of digitalis on vision, three physicians in Boston—Doctors Sprague, White, and Kellogg, observed independently and described in 1925,[5] the same phenomena in digitalized patients. A short time before Doctors Sprague and White wrote me about their observations, I had trans-

lated Purkinje's original description of his self-experiments with digitalis and published it the same year (1925).[6] As Purkinje's description is too long for presentation here, I have selected a few interesting and important passages, which will suffice to indicate the exactness of his observations and the scientific interest in his own reactions to the drug, as well as the explanations of the peculiar flickering he experienced. He states:

"My personal experience with various specific and subjective disturbances of the vision, however small, have led me to suspect that behind the common, indefinite expressions of glaring, flickering, sparkling, etc., something more definite and somewhat more specific could be demonstrated by closer observation. Likewise, the statements of patients about flickering before their eyes after taking *Digitalis purpurea* were never satisfactory to me, and I could not resist the temptation to look for a more exact explanation of the phenomenon. Therefore, I took an aqueous extract of digitalis (three grains daily) during four days and experienced practically no general effects from this small dose. However, on the second day, I noticed a very soft flicker before my left eye, but could discover no regular conformation in the distribution of the lights and shadows. It appeared as if the lens trembled with each look, whereby the altered refraction caused a rapid and fleeting distribution of light and shaded spots on objects. The luster also led me to believe that such a mechanical change in the images might determine the phenomenon. On the third day the flickering was somewhat more pronounced, and it was not only present during winking, but also each time I looked from a light (the window space) to a dark place in the field of vision. This led me to suspect that it was not the mechanical motion but rather the sudden transition from light to dark that was one of the most important conditions of that phenomenon. I then turned the eye toward the bright sky and, without closing and moving it, covered it quickly with my hand and the flickering appeared as markedly as before.

"Frequently the same thing occurred after running a race with someone, and I do not doubt that also others have observed the same thing under similar circumstances. This indicates that the flickering is sympathetic, and may have its idiopathic seat in the pulmonary and cardiac branches of the vagus nerve. In order to convince myself of this, and perhaps to obtain a still clearer demonstration of the flickering, I made a more pretentious experiment some weeks later."

"At about 8 o'clock in the morning, and one hour after a full breakfast, I took a concentrated decoction of the leaves of *Digitalis purpurea* (two drams to half a quart, boiled for half an hour). Toward 10 o'clock I became nauseated, and the pulse, whose ordinary rate was between 60 and 70, had slowed down to 54, missing many times, and I felt a sensation of oppression with each beat, as if the heart had been seized by the hand; otherwise I felt invigorated."

"At noon I ate the ordinary amount without appetite, and expected to correct the neausea with this. During the afternoon the condition remained the same. At about half-past eight in the evening I had an attack of the so-called 'heart worm' (cardiac distress) with intermittent pulse, congestion in the head, especially in the back and toward the left, and a desire to vomit. I stimulated vomiting several times by mechanical irritation of the back of the tongue and the pharynx, this resulting in the expulsion of a large quantity of saliva with mucus and acid food, but not a trace of the decoction of digitalis. During the night I awoke three times from a peaceful, dreamless sleep, being aroused by violent sneezing, which arose from the esophagus as a mild sensation of nausea, and relieved itself in the nervousness during sneezing. Toward 5 o'clock in the morning of the following day there was spontaneous vomiting, which removed no food residue and only a quantity of the unchanged decoction. Now for the first time flickering developed in the left eye: nausea, cardiac oppression, a sensation of weakness and muscular tremor lasting the entire day. I was not disposed to leave the bed, my appetite was poor, and I took only some clear soup off and on, in order to suppress the unnatural vomiting which the digitalis still produced.

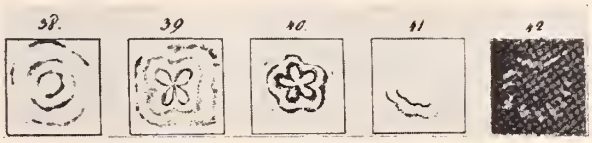

Fig. 3.—Visual disturbances after digitalis (Purkinje, 1825).

"During this entire time the brain was not affected in the least (as, for instance, after opium, camphor, or datura).

"A habitual cough, which I had for several weeks, disappeared entirely during this time, and later did not return.

"I come now to a more detailed consideration of the beautiful forms of light that were observed. [Illustrations in Figure 3, this paper by author.] Figure 39 represents them as they appeared on the second day, and Figure 40 shows an exaggerated form of the same thing on the third day. Toward the last, when the flickering had subsided and practically disappeared, a fragment still showed up off and on, and as indicated in Figure 41, but it was inconstant as to location and behavior. Without further description and allusion to the figures, I shall call these forms flicker roses (rosettes). The light itself is a subjective one, analogous to the sensation of blinding which remains after the effect of a strong external light in the eye."

"One can best illustrate the same thing to himself by making similar streaks with an oily solution of phosphorus on a surface in the darkness, and then, as they begin to disappear, if air is blown on them they show a similar brilliance, a waning and kindling of the light, with disappearance and reappearance of it as is observed subjectively. The two types of light images are not constant throughout in their contours, which indicates an inner relation to the structure of the retina, as can be the case with octagonal radial rays and with rectangular spiral forms (described by the author in Book I)."

"The foregoing suggestion, that flickering after the use of digitalis is more sympathetic than idiopathic, depends on affections of (changes in) the vagus nerve, as confirmed by the latter experiment, sneezing, and the action on the heart and lungs, indicate a marked stimulation of this nerve."

"I do not doubt that a similar flickering can appear in other affections, for instance, after the administration of other nauseants."

STATE MEDICAL ASSOCIATION AND OTHER REMINISCENCES

By Douglass W. Montgomery, M.D.
San Francisco

PART II*

MEDICAL SCHOOL OF THE UNIVERSITY OF CALIFORNIA

I HAVE seen the University of California grow from a crossroads academy to its present proportions, and I have seen its Medical School develop from a lecture hall, just existing and momentarily on the point of being snuffed out, to what it is today.

In 1886 the Medical School was in a building, the gift of Dr. H. H. Toland, situated near the northern extremity of Stockton Street. The active city had grown away from it. It was in a backwater in which it was impossible to develop a clinic, while its rival, the Cooper Medical School, was in the line of the city's development, with excellently appointed and well-manned clinics. Even the

* Part I appeared in June issue, on page 446.

2/9535

County Hospital, in the neighborhood of which our building had been constructed, had been removed to a site as distant as possible. This bad turn was said to be the work of a member of our own faculty, Dr. R. Beverly Cole, of whom more hereafter. We managed to exist through our association with the Dental School, which bore part of the expense of the dissecting room. But the presence of our comrade institution narrowed our quarters to the extent of nearly pushing us out onto the street. Our immediate neighbor to the south was the Inebriate Asylum, superintended by a lively, hospitable man, named Doctor Jewell. I often wonder we did not all, in our extremity, retire there.

OBSTETRICAL TEACHING

The human being, however, when cornered, has many resources, and it is often true that the real advance of a corporation is made in hard distressful times. It is then that measures are taken that bear fruit when the fruitful years come. We were so poor in resources that we had no obstetrical facilities, and our students often graduated without ever having seen a woman in labor. But they had an opportunity to see Beverly Cole. He was an excellent actor, and before all the students, with the aid of a manikin, would go through all the motions of labor exactly and seriously. It may sound ludicrous that a man—and an elderly man at that—and a professor in a school, would give such a representation, and in a less consummate actor it would have broken down into a farce. The demonstration was carried out too seriously, however, to allow of levity.

BEVERLY COLE

Cole was by far the most picturesque figure and, in many respects, the ablest of our faculty. I knew him only as an impecunious, elderly man, at the end of his career, but even then he was a remarkable individual. His practice had gradually receded, partly through age and partly through that extraordinary revolution in surgery brought about by antiseptic methods and the discoveries of Louis Pasteur. Elderly as he was, however, he carried the convention of the American Medical Association in a meeting in Baltimore in 1895, and was elected president, one of three from the Pacific Coast who have held that high honor, the others being Thomas M. Logan of Sacramento, elected in 1873, and President Ray L. Wilbur of Stanford, elected in 1922.

The night before Cole went East to this meeting, several members of the San Francisco County Medical Society adjourned to the University Club, then on Sutter Street. On parting for the night, Cole was heard to say to Doctor MacMonagle: "Now, Mac, you will do all you can for me?" To which MacMonagle answered, "Of course." On Cole's return he telegraphed to the senior class, who met him on the Oakland Mole. Cole made a short speech, in which he said that the honor of being made president of the American Medical Association was all the greater as being unsolicited and unexpected. Those who knew Cole's astute energetic and persuasive electioneering abilities heard this "unsolicited and unexpected" with doubting ears.

As a young man, Cole had the reputation of being strikingly handsome. When I knew him, his raven-black hair and clear complexion had blanched, but his features were still beautiful, and age could not quench his vivacity.

Cole was one of the most sentimental men I have ever known. He longed for sympathy and would get your attention if he had to slap your face to secure it. This longing for attention was accentuated where women were concerned. If a woman entered the room, Cole's mind, no matter what he was engaged in, was instantly diverted to obtaining her attention. This peculiarity sometimes led to embarrassing situations, as under this influence he was not a responsible being, especially not responsible for his tongue. Under this influence he would sometimes act outrageously and, curiously enough, his victims seemed subsequently to be as anxious to forgive as he was to secure forgiveness. There was one exception to this rule of mutual forgiveness for past sins.

Levi C. Lane was one of the finest, ablest men we have ever had in San Francisco. He was a steadfast friend, but a Juno to his enemies. Cole and Lane were at one time associated, and Lane, it is said, construed one of Cole's erratic actions as a defection, which it probably was. As for Cole, one of the delights of his declining years was to estimate that the threshold of the front door of the new Medical Building, which he regarded as his own front door, was higher, as he could see it across the city, than the roof of Lane's school.

Cole had some right to think that the beforementioned door was his own. We shall presently speak of the active part he took to secure the appropriation from the legislature for the erection of the buildings, and of the deft way he steered the enterprise along its early precarious way. Besides the view he enjoyed of Lane's school, he could look into Golden Gate Park. In the infancy of the city, while a civic official, he had had the imaginative ability to drive out with a horse and buggy into the barren sand hills to secure that tract, which was afterward so beautified by W. W. Stow and John MacLaren.

W. E. TAYLOR

Another picturesque member of the faculty was one of our surgeons, W. E. Taylor. He had previously served in the United States Navy, and this training, together with a natural carelessness in monetary matters, eminently unfitted him for civil life. He was a Southerner, and chewed tobacco copiously; and while lecturing would stride back and forth before the students and, having reached the extreme distance between himself and a spittoon, would turn and project a stream of saliva, which always hit the mark. The students, noting his success, would roar with applause.

MOVING DAY FOR THE UNIVERSITY OF CALIFORNIA MEDICAL SCHOOL

There came a day in the old quarters on Stockton Street when the dental school moved to a building

on Market Street, and with it even went one of our professors. The space, which had previously been narrow, now looked as empty as a barn. We had room for clinics, but we had few patients. This was partly due to the number of clinical departments being too small to get a large enough amount of material for each, but principally to our being in a neglected corner of the city. Dr. John M. Williamson, who was always enterprising and a good executive, extricated us from these doldrums. We moved into the second story of a frame building on the corner of Twenty-second Street and Potrero Avenue, where we took advantage of the overflow of patients from the County Hospital. We instantly secured excellent material for demonstration and study, and achieved a saving of time for the students, as much of their work lay across the street. Soon we found that these quarters were too narrow, and Williamson again made a move, this time down to a building of the Sharon estate on New Montgomery Street near Mission. We were here in the midst of a densely inhabited district, and not too far removed either from the school building or from the hospital. We had a good room for a laboratory, a large enough lecture room, and several clinic rooms. It is true that the building was old. It had been the quarters of the National Armory, later famous for its prizefights, and when we entered it the building itself could have been compared to a pugilist whose day had passed but whose frame was still sound. We had, however, plenty of patients, good light, and high ceilings.

We had an excellent staff of young men, among whom were J. M. Williamson, Herbert Moffitt, Leo Newmark, H. A. L. Ryfkogel, H. B. A. Kugeler, G. E. Caglieri, George W. Merritt, Washington Dodge, T. B. Leland, W. G. Hay, and George D. Culver.

WILLIAM WATT KERR

I think we all were imbued with the same just spirit that animated William Watt Kerr, who was the clinical professor of medicine in the hospital. He always said that although we received no remuneration for our services, the students had paid their often hard-won money for instruction, and that they should receive value for it. It must also be said that through the influence of William Osler and his associates in Johns Hopkins University, and through the then recent discoveries in medicine, a change was taking place in medical teaching throughout the entire United States and, in fact, throughout the world.

OTHER FACULTY MEMBERS

Ryfkogel was enthusiastic, young, and able, and gave an excellent clinical laboratory course. But Robert A. McLean, our dean of Scotch descent, used to complain of his bills for material. Enthusiasm, however, although one of the intangibles, is frequently so valuable as not to admit of repression. So thought Williamson and I, who were on the Clinic Committee.

George W. Merritt was associated with Dr. George H. Powers in the eye, ear, nose, and throat work. He was one of the best teachers on the staff, and seemed to have a natural aptitude for keeping the students interested, and for giving them practical instruction.

Kugeler was able and industrious, and he and Newmark used to scour the city for brain tumors, and, curiously enough, died with one himself. Kugeler was a bit boastful. Boastfulness in a lazy man is repugnant, but in a man who does his work it may even serve as an additional touch of human nature.

Washington Dodge, who afterward left medicine for politics and became assessor for San Francisco, was an able man and a good teacher. He had a large table covered with glass, and under this glass the formulae of his favorite prescriptions. It gave the students a good opportunity to study the formulation of prescriptions, and as he was an excellent pharmacist they got a good course in this important branch.

Leo Newmark, then as now, was the most learned man of us, and the most persistent mimicker of the peculiarities of his friends. He had also an uncontrollable desire to favor the advancement of any lame-duck he might know.

W. G. Hay, my associate, had a nimble mentality, and a lovable nature. It was from a patient in this clinic that Hay and I secured the material to demonstrate the presence of sebaceous glands in the mouth.

George D. Culver and I were associated for over twenty-five years, when untimely death removed him from one of the pleasantest associations ever granted to me.

EARLY STEPS TOWARD PRESENT MEDICAL CENTER

In the course of time it was determined to apply to the legislature for a grant for buildings to house the medical, dental, pharmaceutical, and law departments of the University. In presenting this petition I got my first experience in lobbying. Cole was in Sacramento at the same time and on the same errand, and it was easy to see how able and well-fitted he was for his task. As for myself, my contribution to the success of the measure was probably small, but to my surprise I found the legislators earnest, courteous men, evidently anxious to weigh the merits of any proposition laid before them and not at all engaged, as I had anticipated, in frivolously scattering the people's money. I received then a lesson in representative government I have never forgotten. I found that, with all the apparent scandal and inefficiency incident to this form of governing, the public business is, as a rule, transacted well and that the prosperity of California, and also of the United States, is no accident. One day, however, I tried to do politics. I became acquainted with a man in the Golden Eagle Hotel bar, who I thought was a member of the legislature. After spending time, and something else, on him I learned he was an undertaker, with his place of business on Mission Street, San Francisco, and that he also was on a lobbying expedition. On finding that I was a doctor, practicing in his city, he said confidentially: "Anything you throw

in my way I'll make all right with you." A vision of throwing bodily through the air the remains of a former patient so that it might alight, like a well-directed quoit, on a certain spot on Mission Street arose before my eyes. I tried no more politics at that session, and confined myself to simple exposition.

After getting the appropriation through both branches of the legislature, the bill had to be signed by Governor Budd. The outcome was doubtful. At a large dinner at the Palace Hotel, given, as I remember, by the faculties interested, Cole managed to jockey Governor Budd into a public assent. The hurdles we had to jump, however, seemed to be infinite. The bill provided for buildings, but not for ground. We had two offers for sites—one secured from John Center, of a lot on Potrero Avenue, not far from the hospital, and favored by Dr. W. F. McNutt; the other, the present site, was offered by Adolf Sutro, and favored by Cole. I was distinctly on McNutt's side, both on account of the clinic that I always had on my mind, and on account of the proximity to the hospital. I felt that the Sutro site was too far removed, both from the city population and from the hospital. Cole thought little of the laboratory, clinical or bedside teaching, as he had been trained and had achieved his successes under the lecturing system. I soon saw, however, that the Sutro site was so superior, both as granting sufficient space for all the faculties and on account of its magnificent situation, that contention had to cease.

A word about the donor. Adolf Sutro was a striking figure wherever he might be. He had bushy white hair, white whiskers, and a strong handsome profile. He had a vigorous body and an active step. He wore a broad-brimmed, white, soft felt, wide-awake hat. He told me that once in Paris a cabby, on catching sight of him, called to a comrade: "Voilá c'est Buffala Bill!" The comrade answered: "Non, ce n'est pas Buffala Bill, c'est le père de Buffala Bill." He certainly looked as if he might have been the father of Buffalo Bill. Adolf Sutro had ability and imagination, and could foresee what San Francisco was to become and he staked his large fortune on the event. I believe that at one time he owned one-sixteenth of the total area of the county. He had an eye for situations, and he located his residence at Sutro Heights. I have seen Miramar, the castle of Maximilian, the one-time emperor of Mexico and, charming as it is, it does not compare with Sutro Heights, with its view of the Golden Gate, the Pacific Ocean, and the Beach. He chose another site, an elevated shelf sunk in a vast amphitheater, with a view north over the city and the Park and, far in the background, Tamalpais. This he intended for his library, an area of twenty-seven acres. What a dream it was! He agreed to let the Faculties have one-half of this amphitheater, reserving the other half for the library.

Having secured the appropriation and the site, we still had a few very considerable difficulties ahead of us, of which the furnishing of the building was not the smallest. This we did with our own money. Then the earthquake came, and with the change from a school building into a hospital, and the entrance of the school and the buildings into a new phase, the history of which others than I may sketch.

Again I wish to thank you, my colleagues, for the honor you have accorded me and for the opportunity afforded of recalling many pleasant recollections of the men and institutions I so long and so happily lived with.

450 Sutter Street.

CLINICAL NOTES AND CASE REPORTS

HUMAN MYIASIS

(HYPODERMA BOVIS DE G.)

By G. D. Billingsley, M.D.
Los Altos
AND
H. J. Templeton, M.D.
Oakland

THE drama of the sudden emergence of a small worm from a lump beneath a patient's skin, coupled with the rarity of such an occurrence, prompts us to report briefly the following case:

REPORT OF CASE

The patient, M. B., white, male, age five years, was seen on December 6 for treatment of a slight painless swelling of the left subauricular region which developed about twenty-four hours previously without apparent cause. History and examination of the patient did not reveal the cause, and the mother was advised to apply hot fomentations for a few days. Three days later she brought the patient in with another bluish-red, painless swelling of the lobe of the left ear. The original swelling of the subauricular region was subsiding. Hot fomentations were again used on the ear for a few days. The second swelling gradually subsided during a period of about three weeks. On December 23 the mother reported that a small papule, about one millimeter in diameter, had appeared at the site of the original subauricular swelling; upon squeezing it she had expressed a small worm, which she brought in. She said it did not appear alive at the time she pressed it out; and when examined it was somewhat dried, about 1 by 5 millimeters in size, and of a light brown color. After being placed in water for about an hour or so, and examined under the low power of the microscope, it appeared similar to a blowfly maggot. Transillumination of the left ear lobe during the time of the swelling and discoloration there revealed what seemed to be a foreign body of very slight density, and about the size and shape of the larva mentioned. Incision and search for it by dissection was without results. The supposed foreign body was probably a cartilaginous process, as later a very similar shadow was seen upon transillumination of the other ear lobe. The wound healed promptly, and to date there have been no other complaints.

At no time could we obtain a history of insect bites, recent wounds, illness or similar previous condition of the patient or other members of the family. The child had lived on a farm in the vicinity of Los Altos, California, all his life, except for a few trips to Vallejo, California. No maggot infestation of the stock on the farm where he lived had been noted; but we have been told by the local veterinarian that such infestation of cattle by the Hypoderma bovis is fairly common around Los Altos.

COMMENT

The worm, measuring about 10 by 2 millimeters, was sent to W. B. Herms of the University of California. He reported that it was a larva, the ox warble, Hypoderma Bovis De G. Herms had previously reported a case occurring in California. His patient was bitten by a fly about the end of July. Several days later soreness and swelling developed. The swelling migrated down the leg, up again, across the groin, then up the trunk to the scapular region where, in October, the worm finally emerged through the skin. Thus, the total period of its migration was approximately three months. There was no history or evidence of migration of the worm in our patient.

ANAL RESECTOSCOPE

By CHELSEA EATON, M.D.
Oakland

GOLF scores are due to technique, but surgical results are due to technique plus good exposure. In surgery, good technique can be employed only when exposure is adequate. However, the cost of adequate exposure in many instances is too great. The endeavor to visualize and deal with pathological conditions often leads to inordinate traction and retraction of tissues. An unjustifiable degree of trauma is the direct result of these manipulative processes.

That this type of trauma is the usual accompaniment of anorectal operations is well known. Here, where the sphincter is divulsed, where the mucous membrane is retracted and everted from the anus, where the vessels of the hemorrhoidal plexus are ruptured, and where blood is extravasated into the perianal tissues, a considerable degree of damage is produced.

As a result of this traumatism, there is a distortion of demarcative lines between normal and pathological tissues. Furthermore, valuable landmarks, which should serve as guides in the operation, are lost. If it is true that the results of anorectal operations are more unsatisfactory than those of any other ordinary procedure that the surgeon is called upon to perform, this factor of traumatic exposure may well be considered.

Fig. 3.—Ligating the blood supply above the dentate line, preparatory to excision. The patient is in the prone position, and the resectoscope is opened sufficiently to expose the hemorrhoid in the anterior right quadrant.

To provide adequate exposure and avoid unnecessary trauma was my purpose for devising the anal resectoscope—so called because it is a surgical instrument, in contrast to an anoscope, which is usually employed for examination.

The instrument is composed of two hemicylinders of tempered steel—the inner piece being encompassed by the outer—and an obturator. After inserting the instrument (as an ordinary anoscope) and withdrawing the obturator, an arc of the anal canal, varying from zero to 180 degrees, may be exposed by rotating the handles which are attached to the hemicylinders. The length of the instrument is 6 centimeters, and it has a uniform diameter of 3.5 centimeters.

Sufficient space is exposed by the resectoscope to permit ordinary anal surgery. Hemorrhoids, hematomas, fissures, and anal infections are effectively removed with facility. Furthermore, the accuracy of the surgical procedure is greatly enhanced because important anatomical landmarks, such as the intermuscular septum, the anorectal junction, and the dentate line, are not distorted.

The necessity for acquiring a slightly increased dexterity of surgical technique will be amply rewarded by the increased welfare of the patient.

CORNEAL TRANSPLANTATION

By Max Fine, M.D.
San Francisco

THE recent outbreak of sensational newspaper accounts of corneal transplantation will result in a flood of inquiries to the profession from the blind and near-blind throughout the country. The recent statement in an Associated Press release that 250,000 blind may have their sight restored, has already brought forth a voluminous correspondence from the friends and relatives of unfortunates, blind from advanced glaucoma, optic atrophy, and other hopeless conditions. It is important, therefore, that every physician should be acquainted with the possibilities and limitations of the operation.

Corneal transplantation was first attempted a little more than one hundred years ago. The first description in the English language was written by S. L. Bigger in the Dublin *Journal of Medical Sciences* in 1837. In the absence of anesthetics, aseptic technique, and adequate instruments the early attempts were universally unsuccessful, and the transplantation of corneal tissue, with maintenance of transparency, was regarded as impossible until Von Hippel in 1878 described a technique which resulted in a number of temporarily transparent grafts. The first permanently successful transplant was described in 1907. Since that time, with constant improvements in technique, and with experimental work to determine the conditions necessary for successful transplantation, it has become possible to state that such transplantation undertaken in suitable cases is a practical procedure.

The conditions for which such an operation may be performed are very limited and constitute only a very small percentage of the causes of all blindness. The conditions *under* which such an operation *should* be performed further limit this small group. The transplantation of cornea is useful only in those individuals in whom the cornea has become opaque through disease or injury and in whom the remaining ocular structures are in good condition. This excludes the large number of blind with glaucoma, detached retina, atrophy of the optic nerve, inflammatory diseases of the retina, and choroid and pupillary membranes following severe iritis. The presence of a cataract is not in itself a contraindication to transplantation of the cornea, but makes the operation much more difficult and naturally reduces the chance of success. The operation should not be done in an individual who has one sound eye and should not be done, in my opinion, in a one-eyed individual whose vision is 1/10 or better, since the resultant visual acuity is in the majority of successful cases only 1/10. It is, then, an operation to be reserved for a small number of desperate cases. One could estimate that in San Francisco and its vicinity not more than a dozen such individuals would present themselves.

Several hundred such operations have now been performed in all parts of the world, and it is possible to state what results may be expected. The transplanted tissue will take in 80 per cent of cases (those eyes in which it does not take are usually lost). About 25 per cent of all grafts which take remain transparent with improvement in vision from 1/10 to 9/10. The remainder become opaque. It may be said, in general, that a properly selected case has a 25 per cent chance of getting useful vision and a 50 per cent chance of improvement. The best results are obtained in cases of corneal opacity following interstitial keratitis, in which as high as 75 per cent successful transplants have been reported. In opaque leukomas, due to other diseases, the incidence of improvement after transplantation is less than 10 per cent. It is generally recognized that the more normal corneal tissue there is present in the bed the greater the chance of success. The more fibrous tissue the less the chance of success.

Corneal tissue for grafting may be taken (1) from living eyes enucleated for such reasons as intraocular tumor, severe injuries, patients in whom the cornea is healthy; (2) from eyes of stillborn infants; (3) from the eyes of cadavers. In the last two cases the eye must be used within an hour after death or may be preserved by freezing at 3 degrees centigrade for use within three days. It is believed that the younger the donor the better the tissue is for grafting, and that the cornea of a stillborn has greater viability than that from other sources. This fact, together with the greater ease of obtaining and preserving the tissues of infants makes this source the most desirable if suitable living eyes are not available. Compatibility of blood groups appears to have no bearing on the outcome. If one considers the fact that the number of candidates in this country is very small, and that at least two grafts may be taken from any one eye, the need for preserved material does not appear great.

Numerous techniques have been advocated. The one which is finding general acceptance at present is that of partial penetrating keratoplasty. In this operation a square or disc, about 4-5 millimeters in diameter and of the entire corneal thickness, is removed from the center of the opaque cornea and replaced by a corresponding section from the donor cornea. The graft is held in place by conjunctival flaps or by fine silk bridle sutures which are anchored in the surrounding cornea and merely pass over the graft to prevent its displacement. Beveling the margins of the graft inward provides a broader nutritional surface, and at the same time prevents the graft from falling into the anterior chamber. Vascularization of the graft disposes to its opacification. An avascular graft which takes is apt to remain clear. The grafted tissue is for a long time insensitive and must be protected much like an anesthetic cornea. The period of hospitalization is usually three to four weeks, and during at least the first week special nursing is needed to prevent any exertion or sudden movement on the part of the patient which might dislodge the graft. The financial burden is, therefore, considerable.

If a graft has taken but has become opaque, a second graft may be attempted after a suitable interval. It sometimes happens that the first graft becomes partly opaque, but at the same time provides a more suitable ground for a second transplant, which will give improvement in vision.

490 Post Street.

INFLUENZAL BRONCHOPNEUMONIA*

BILATERAL ALTERNATING PNEUMOTHORAX

By Bernard E. McGovern, M.D.
San Fernando

AND

Leon A. Frankel, M.D.
Philadelphia, Pennsylvania

THE pneumothorax treatment of nontuberculous pneumonia and lung abscess is beset with many limitations and contraindications; but since this case presented so many unusual and enlightening features, we feel that a report of it may elucidate some of the problems connected with this form of therapy.

REPORT OF THE CASE

The patient, a white female thirteen years old, consulted one of us (L. A. F.) on December 1, 1934, because of acute rhinitis, with a temperature of 101 degrees Fahrenheit. She was much improved on the next day; but on December 3, 1934, she suffered a severe chill followed by prostration, a hacking cough, chest pains, headache, general cyanosis, a temperature of 105 degrees Fahrenheit, a pulse rate of 140, and a respiratory rate of 40 per minute. She was admitted to the medical wards of St. Luke's and Children's Hospital on December 4, 1934, with a diagnosis of beginning pneumonia. She then presented a blood pressure of 88/62 millimeters mercury; crackling râles in the left midscapular line between the second and third intercostal spaces, and between the seventh and eighth intercostal spaces in the right midscapular line; bronchial breathing beneath the left scapula; bronchial breathing and areas of dullness over the right lower lobe posteriorly. An influenzal type of pneumonia was suggested by the white cell count (Table 1), which remained low until December 11, 1934, about the time the multiple lung abscesses and a small purulent effusion of the left pleura became evident.

The patient had been hospitalized previously for three days (May 9, 1934 to May 12, 1934) because, beginning August, 1933, and continuing during the winter of 1933 to 1934, she developed amenorrhea, anorexia, loss of weight (from 135 pounds to 90 pounds) (May 9, 1934), emotional instability, colicky abdominal pains, weakness and fatigue, frontal headache, and purulent nasal discharge. The findings during this hospitalization were mainly: restlessness; general muscular atrophy; long slender extremities; extensively pitted fingernails; cold hands and feet with marbled vasomotor cyanosis; dry skin and hair; height, 66 inches without shoes; weight, 90 pounds in kimono; internal strabismus; slight congestion of the nasal mucous membranes with thickening, spurs, and deviation of the septum, which caused pressure on the middle turbinates; injected lymphoid follicles on the posterior pharyngeal wall, and small lymphoid tufts in the tonsillar fossae; a number of palpable cervical glands; a few post-tussive râles in the left lower posterior axillary region, persisting after deep breathing and coughing; a blood pressure of 92/65 millimeters mercury. Genital examination (made by Dr. Charles Dunn) showed lack of pubic hair; underdeveloped external and internal genitalia; atrophic breasts, chiefly the left; some pigmentation about the right areola. The temperature ranged from 97.8 degrees Fahrenheit in the morning to 100.2 degrees Fahrenheit in the evening. The basal metabolic rate was normal; and the intracutaneous tuberculin test, and Wassermann reaction for lues were negative. Dr. Charles Dunn,[1] a consultant, diagnosed the condition as Simmond's disease; but we felt that there was an infection present which was depressing a naturally weak endocrine system; and after first considering incipient pulmonary tuberculosis, we decided that there was an upper respiratory infection (nose and throat) causing a mild chronic pneumonitis.

On December 17, 1934, five cubic centimeters of thick yellow fluid were removed from the left costophrenic sulcus; and besides this, the usual treatment for pneumonia, including oxygen and digitalis for circulatory weakness, was employed without apparent result until December 20, 1934, when pneumothorax was begun. Within sixteen hours after left-sided pneumothorax was instituted (Table 2), her temperature dropped from 104 to 100 degrees Fahrenheit; and the general improvement, including lessened cyanosis and circulatory collapse, was in accordance with the fall in temperature (Table 3). Following the induction of right-sided pneumothorax (Table 2), the temperature fell from 100.5 to 99 degrees Fahrenheit within one hour; and from this point onward her recovery was rapid.

The probable presence of dense adhesions between the pleural surfaces posteriorly and laterally was suggested by a negative rise of the manometer, without further oscillations, when we first attempted to give pneumothorax in these regions. The stretching and tearing of cobweb adhesions in the more anterior pleural spaces were suggested by a gradually widening circle of pain about the puncture sites when induction was first done more anteriorly on each side. This tendency to obliterative pleuritis, combined with a very mobile mediastinum, necessitated keeping the air in both pleural cavities well balanced to prevent the adherence of one or the other lung to the chest wall. However, this tendency of the mediastinum to bulge to one or the other side apparently permitted enough collapse in the side, containing the least air, to be of benefit to that side.

From December 4, 1934, to February 6, 1935, inclusive, six sputum smears showed pneumococcus once, short chain

December 29, 1934	Left	−5, −10	−4, −8	100
December 31, 1934	Right	−7, −11	−6, −10	150
January 4, 1935	Left	−6, −12	−4, −7	250
January 5, 1935	Right	−8, −12	−7, −11	125
January 8, 1935	Right	−6, −13	−4, −10	150

The pneumothorax was continued after the above fashion until April 26, 1935.
* The difference between the tops of both columns of water was taken as the manometer reading.

streptococcus four times, micrococcus catarrhalis four times, and an abundance of pus cells at all times; a sputum culture showed short chain streptococcus on December 12, 1934; no tubercle bacillus, Friedlander's bacillus, spirillae, fusiform bacillus, yeast or mold organisms were found at any time. Urinalysis (December 4, 1934) was negative. Mantoux tuberculin test (using O. I. mgm. O. T.) was negative after forty-eight hours on December 17, 1934, and January 14, 1935. Red cell sedimentation test was positive (thirty minutes) on December 17, 1934.

Roentgenograms of the chest (Dr. Joseph Post) revealed: December 5, 1934, slight elevation of left diaphragmatic leaflet; thickened pleura with early pneumonic infiltration in the lower part of the left side; compensatory emphysema of the right upper lobe. December 8, 1934, a pneumonic process involving about the lower three-fourths of the left lung, the right lower and middle lobes, and the lower part of the right upper lobe; pleural thickening between the right middle and lower lobes, and over the lower right lateral chest wall; compensatory emphysema in most of the right upper lobe. December 15, 1934, decreased area of consolidation in the right middle lobe with beginning central softening; mottled infiltration of the lower three-fourths of the left lung with increased density of the left costophrenic sulcus. December 19, 1934, multiple small cavities (largest not over six or seven centimeters in diameter) throughout the lower three-fourths of the left lung; right lung field unchanged. December 21, 1934, a pneumothorax on the left side apparently partly emptied the abscess cavities; beginning cavitation in the right middle lobe; a small cavity in the lower portion of the right upper lobe. December 26, 1934, a small left-sided pneumothorax with lessened infiltration, partial closure of the cavities, and a mediastinal shift to the left; the right side showed moderate pneumothorax, two fissural pleura adhesions between the middle and lower lobes and extending to the chest wall, persistence of the middle lobe cavity, and absence of the upper lobe cavity. January 2, 1935, increased collapse of the upper left side, less infiltration, and more cavity closure; the right hemothorax exhibited less pneumothorax, the persistence of the cavity and fissural pleura adhesions. January 8, 1935, almost complete absence of bilateral pneumothorax, but less infiltration and cavitation of both lungs. January 10, 1935, satisfactory bilateral pneumothorax, lessened infiltration and marked cavity closure in both lung fields.

The patient was discharged from the hospital on February 7, 1935, with our final diagnosis of influenzal bronchopneumonia with multiple streptococcal lung abscesses. Her weight was then 105.5 pounds; her cough and expectoration were slight; her other symptoms had disappeared. The pneumothorax was continued in the out-patient department until April 26, 1935, then stopped. Since her improvement had been progressive and no tuberculosis was found, no attempt was made to combat the steadily developing obliterative pleuritis by the use of pressures less negative. Her weight was 114¼ pounds on April 28, 1935; and beginning on this date, three successive daily sputum examinations showed no tubercle bacilli. An x-ray film (April 30, 1935) revealed a small bilateral pneumothorax, and considerable linear fibrosis in both lung fields, especially in the lower lobes.

TABLE 3.—*Peak Variations of Temperature, Pulse and Respiratory Rates*

Dates	Temperature, Degrees F.	Respiratory Rates, Per Minute	Pulse Rates, Per Minute
12/4/34	104.4	32	120
12/11/34	99.4	28	104
12/20/34	104	40	140
12/28/34	100.4	38	148
1/3/35	98.2	28	116

After January 3, 1935, the temperature, pulse and respiratory rates rapidly stabilized toward normal.

COMMENT

The case report presented is of a patient who had influenzal bronchopneumonia, complicated by multiple, bilaterally distributed lung abscesses of probable streptococcal origin. When all orthodox treatment had failed and the patient was rapidly approaching moribundity, bilateral pneumothorax resulted in prompt reduction of toxin absorption with loss of temperature, dyspnea, and cyanosis; clearing of infiltration, closure of cavities, and recovery rapidly followed. An obliterative pleuritis, combined with a very mobile mediastinum, made it difficult to preserve a satisfactory pneumothorax and to keep the chest contents from shifting to one or the other side. Such shifting might have resulted in complete adherence of either lung to the chest wall.

Our aim was to gradually produce a moderate collapse of the lungs, and to maintain it by giving small amounts of air at short intervals because too much collapse might have lowered the vital capacity

too greatly; rapid administration of large amounts of air could have prevented absorption of the alveolar air between refils, resulting in lowered vital capacity, distortion and shifting of the chest contents with resultant bending and crowding of the cardiovascular apparatus and bronchi, and blocking of abscess drainage.

The use of pneumothorax for lung abscesses, especially for large thick-walled abscesses, is extremely limited and entails the danger of spreading the infection to contiguous tissue. Our fortunate results in this case were due largely to the fact that the abscesses were small and still in the acute, thin-walled stage. If pneumothorax is used when the abscess is close to any pleural surface, adhesions may prevent collapse of the cavity, or tear the lung and cause bronchial fistula and empyema. Adhesions of any part of the lung or pleura may distort the lung and block the abscess drainage if pneumothorax is used.

The status of pneumothorax in the treatment of nontuberculous pneumonia is not yet established; and we know of no other case of bilateral nontuberculous pneumonia wherein it has been successfully tried before. It would seem that our good results in this case were due mainly to the collapsibility of the involved tissue. Also the discrepancies reported in the literature, concerning the results of pneumothorax in nontuberculous pneumonia, may be partly explained by the collapsibility or noncollapsibility of the infiltrated areas.

CARDIOSPASM

By GUNTHER W. NAGEL, M.D.
San Francisco

IN a recent publication,[1] we reported the good results of hydrostatic dilatation for cardiospasm. Since this report several other patients have been treated with equal success. One of these cases presented the following unusual sequence of events.

REPORT OF CASE

A woman of sixty-two years of age had increasing difficulty in swallowing for a period of four years. In the beginning, liquids caused as much trouble as solids. Her condition gradually became more marked and she regurgitated her food frequently. She described the regurgitated material as never having entered her stomach. Her weight decreased thirty pounds in a few months. Six months ago she had a sudden, severe epigastric pain, and was unable to retain any food. A diagnosis of complete obstruction at the lower end of the esophagus was made elsewhere and a gastrostomy was done.

The patient came to us after having been fed for six months through a gastrostomy tube. X-ray pictures showed a typical cardiospasm with dilatation of the esophagus. The spastic esophagus was dilated with a Plummer hydrostatic dilator, using a previously swallowed thread as a guide. Within twenty-four hours her eating was normal, and in a few days her gastrostomy opening closed. In a recent check-up on this patient, we found that she has gained fifteen pounds in four months and has been entirely free of all former symptoms since hydrostatic dilatation was performed.

1 Nagel, Gunther W.: Cardiospasm, Calif. and West. Med., Vol. 45, No. 3 (Sept.), 1936.

Fig. 1.—Cardiospasm, showing dilated esophagus.

COMMENT

In the majority of cases the diagnosis of cardiospasm is easily made. This patient's age and the story of complete obstruction requiring gastrostomy, together with the x-ray films she brought with her, suggested a malignant stricture of the esophagus. Against this was the long duration of symptoms and our own x-ray findings. The complete relief of this patient, and her return to normal habits and manner of eating, emphasizes two points: the importance of considering cardiospasm as a cause of esophageal obstruction, and the good results obtained by hydrostatic dilatation.

2000 Van Ness Avenue.

Carbuncle.—Berman believes that a study of the microscopic anatomy of the skin on the back of the neck and on the face clearly explains the behavior of carbuncle and definitely establishes carbuncle of the face as a distinct entity. He studied 125 cases of severe carbuncle, eighty-three in men and forty-two in women. The majority occurred on the back of the neck in both men and women, but carbuncle occurred twice as commonly on the face of women, whereas it was more common on the scalp of men. The face is a dangerous place, for four of the nine deaths occurred in facial carbuncle. Most carbuncles occurred in patients without debilitating disease; this was more noticeable in women than in men. Obviously the "picking" of cutaneous infections is an important causative factor. Of all associated diseases, diabetes is most frequent. Carbuncle of the face should be treated conservatively. The general mortality in facial carbuncle was 40 per cent. Carbuncle elsewhere on the body, associated with severe debilitating disease, must also be treated conservatively. Five of the nine deaths occurred in this group. The general mortality was 18 per cent. Carbuncle not on the face and not associated with severe disease should be treated by surgical intervention. This may be by excision or incision. The general mortality in this group was 1 per cent.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

BONE TUMORS

I. SYMPTOMS AND DIAGNOSIS

George J. McChesney, M. D. (450 Sutter Street, San Francisco).—There is no more important and often difficult problem that may suddenly confront the general practitioner and specialist than the proper diagnosis of an abnormal bony mass. Usually a very careful history, use of laboratory aids and especially good x-rays will establish the nature of the tumor satisfactorily. This is not always the case, however. Osteomyelitis, tuberculosis, and syphilis may present masking symptoms which can cause considerable chagrin when the pathologist has made his report. Of even more importance is the question of malignancy with possible amputation of a limb. Here let me plead for the greater use of a biopsy in such doubtful and important cases. It has never been proved that such a procedure has disseminated a malignancy, or that cases so handled have metastasized more rapidly. With a properly done biopsy (and this means removal of an adequate amount of tissue, not a punch biopsy, with access to a skilled pathologist), one can do whatever is indicated with the feeling that all possible precautions have been taken. The pathologist is the court of last resort, but even he may have trouble in deciding upon certain varieties of sarcoma. As an additional precaution an x-ray treatment can be given before the biopsy and another afterward, if the pathologist's opinion is delayed while the specimen is being decalcified.

In bedside study and diagnosis, the all-important question is that of possible malignancy. The most practical way to answer this is to keep in mind the benign tumors and their symptoms. If the tumor can be classified under any one of them, while at the same time osteomyelitis, tuberculosis, syphilis, and even callus, following fracture, can be ruled out, the problem is solved.

Benign Tumors.—The most common benign tumors are:

1. Exostoses or osteochondromas, characterized by fairly constant age limit of ten to twenty-five years, lack of pain, location near ends of long bones, and attachment by a broad base or pedicle. The x-ray shows fairly normal bone structure.

2. Chondromas, occurring from twenty to thirty years, usually in phalanges of hands and feet, occasionally in ribs and sternum. In x-ray show as a central cyst with expanded cortices. Soreness is slight and growth gradual.

3. Bone cysts, usually between ages of ten to fifteen, rarely over twenty. Distribution is pretty constantly in upper halves of the humerus, femur and tibia in order of frequency. The cortex is expanded and thinned, with a resultant tendency to pathologic fracture. Soreness is negligible and growth slow.

4. Giant cell sarcomas occur usually after thirty, grow faster with some pain, and may be related to trauma. They are most common in the epiphyses of long bones ending in knee and wrist joints, have a thin bony shell which is soon perforated.

Malignant Tumors.—Turning now to the malignant tumors, we have several forms of sarcomata, all with a very useful diagnostic clue, viz., periosteal changes in the x-ray. Primary chondrosarcomas occur at ages of fourteen to twenty-one, usually about the knees and with pain. Secondary chondrosarcomas occur in adults, about ribs and sternum, and are slow and painful. Sclerosing osteogenic sarcomas occur between the ages of fifteen and twenty-five, usually in the region of the knee, and run an acute, painful course. Osteolytic osteogenic sarcomas differ only in running a slower course. The main identifying characteristic is, as above, periosteal growth shown in x-ray.

One form of sarcoma, however, the so-called Ewing tumor, presents diagnostic difficulty in its resemblance to chronic forms of osteomyelitis. Both may have pain, fever, and leukocytosis in the same age groups. The x-ray is more helpful, especially as the tumor does not form an involucrum. Here biopsy may help, but must go deep enough to get the cells in the center of the tumor.

Multiple myelomata can be recognized by incidence after age of sixty, multiplicity, punched-out x-ray appearance, etc.

Metastases from carcinoma arise principally from disease of the prostate and breast. Hypernephroma is third in frequency. Pain is usually marked, fracture can be expected and involvement is most frequent in spine, pelvis, and femur. X-ray picture is essentially of a destructive character.

To give the differential diagnosis between these tumors and the familiar diseases of osteomyelitis, tuberculosis, and syphilis, is beyond the limit of this discussion; but if the cardinal and well-known symptoms of these diseases are kept in mind, their separation from the tumors is not usually difficult, except in the case of the Ewing sarcoma.

* * *

II. PROGNOSIS AND TREATMENT

Robert L. Carroll, M. D. (Orthopedic Hospital, Los Angeles). *Benign Types.*—Benign bone tumors are usually very slow-growing, and since they do not metastasize cause local trouble only. Without treatment they will probably enlarge some. Osteochondromas usually grow most during the rapid growth of bones in adolescence or even earlier, while other bone tumors may continue to grow in adult life.

Osteomas and osteochondromas may cause mechanical blocking of the near-by joint, or tendons may ride over them, causing a snapping sensation when they ride over the crest of the tumor, and in doing so may cause some pain. If discomfort is great, the mechanical obstruction should be removed by excision of the tumor. There is a moderate tendency to recurrence after excision, particularly in the osteochondromas; hence postoperative irradiation is advisable. Geschickter and Copeland report that 7 per cent of osteochondromas become malignant.

Although *endochondroma* is a benign tumor, the larger the tumor the more potentially malignant it becomes and is probably best treated by irradiation. The smaller ones are best treated by complete curettage of the tumor mass, but if too large for complete removal irradiation should follow the surgery, especially in the long bones—as the tibia—though they occur here rarely. There is a definite tendency to recurrence.

Bone cysts may increase in size until they begin to destroy the cortex of the bone enough to allow a pathological fracture, following which there may be a spontaneous cure. Bone cysts usually respond well to irradiation or curettage. If curettage is done it should be as complete as possible, and the cavity should be filled with bone chips. There is a moderate tendency to recurrence.

Considerable discussion has arisen, and there is voluminous literature concerning *giant cell tumors*. All agree that this tumor is essentially benign. Some dogmatically state that it is always so, whereas others equally dogmatically state that the viability and aggressiveness of the tumor cells may change toward the malignant type and may metastasize to the lungs though extremely rarely. Each side presents its arguments not without some justification, and it would seem logical to assume that a complete correct answer has not yet been found. The treatment of these tumors has changed considerably in the last few decades from radical to more conservative, and in place of amputation resections have given many good results. Then curettage of the tumor in the early stages was found to be satisfactory and did not leave the deformity that resection would cause, and now the treatments appear to lie between curettage and irradiation. Even though irradiation has not been accepted as the method of choice by all, it has given some good results. More time and study of these cases will doubtless eventually clear up some of the points not thoroughly understood at present. Without treatment they usually continue to grow, and sometimes with treatment. No one set rule can be given for treatment of all giant cell tumors. All the data must be considered before the decision is made. In many of the cases early irradiation will prove quite satisfactory. Also complete removal by curettage and filling the cavity with bone chips will usually give good results. There is approximately 20 per cent recurrence following curettage. If curettage is selected as the method of treatment, Kolodny states that it should be continued, even with recurrences, rather than change to irradiation, and that it is even better to amputate before changing from repeated curettage of the same tumor to irradiation of it, as there seems to be good reason to believe that the irritation from surgery, together with irradiation, may make the tumor cells more viable and aggressive, and the possibility of malignant change and metastasis becomes greater. When the tumors are found early, irradiation usually gives good results. If a tumor is seen for the first time in the advanced stage, complete removal may not be practicable; but even though it is considered a benign tumor, if amputation would give better practical results there is no reason why whatever method that will do so should not be used. Also, in the very large tumors, if they are curetted, there is the danger of hemorrhage which has been reported in some cases to be fatal. Also, if they are packed open, there is the danger of infection with subsequent osteomyelitis, and in such a case it can be clearly seen that an amputation, if this were about the ankle or the knee, and if the tumor were very large, may give a better practical result. With adequate treatment of the tumor in the early stage there should be a good prognosis.

Malignant Types.—Malignant bone tumors have a grave prognosis, although a few five-year cures have been reported. Usually the patient may live anywhere from a few weeks to a few years, depending upon the rapidity of the growth and the degree of malignancy of the tumor. It has been noted that the nearer the trunk the greater the degree of malignancy appears to be and, consequently, the worse the prognosis. Whenever the diagnosis is in question, the patient should have the advantage of irradiation until the diagnosis is established. Since the prognosis is grave, whatever makes the patient's remaining life most comfortable and most useful should be used. The first thing requiring attention usually is relief of pain, together with prevention of increased pain in the future, for which irradiation is desirable, as well as for the prevention of growth of the tumor. If it were possible to amputate before there are any metastases, this should affect a cure. Since it has been proved that metastasis to the lungs has occurred by the time the primary growth was discovered, although it was in so early a stage that it was barely discernible by x-ray, amputation should be approached, not with the idea of preventing metastasis entirely, but to relieve the patient of pain which may become almost unbearable with a rapidly growing tumor, some of which may become so vascular that prevention of ulceration and hemorrhage becomes a problem. Also, the foul discharge from such an ulcerating tumor mass would probably be more unpleasant than the sight of an amputated leg. Most surgeons experienced with malignant bone tumors in the lower extremities prefer amputation, and this should be done between two tourniquets, the proximal one for hemostasis, and the distal one to prevent a possible dislodgment of tumor cells into the blood stream. Even if biopsy is done, this precaution should be taken so that the amputation may be done if the pathology confirms the diagnosis. Some of the cases with least discomfort and most useful lives have been those of bone malignancy in the lower extremities, recog-

nized apparently in the extremely early stage with immediate amputation, and later satisfactory artificial leg, which allows the patient to regain satisfactory function of the lower extremity and live a useful, comfortable life for a while even though death may occur years later from pulmonary metastasis. Resections have been done at times, but are not as much in favor with our present advancement in prosthetic surgery as amputations. Disarticulations of the proximal joints has also been done with the hope of trying to avoid metastasis, but the end-results have been apparently no better than with amputation, even though the malignant tissue may involve the marrow cavity of the bone at site of amputation without being apparent in x-ray. Hence, amputation, preceded and followed by irradiation, for malignancies in the lower extremities, seems to give the best practical result. Amputations and disarticulations in the upper extremities have not proved as satisfactory as in the lower extremities. Here irradiation usually is the method of choice where it can be skillfully applied to alleviate the pain and retard the growth of the tumor. It is not without its disadvantages, however, because insufficient irradiation may stimulate the new growth, whereas too much irradiation is dangerous and may ankylose the near-by joint by sclerosing the soft parts. The psychic shock to the patient is probably greater in amputation of the upper extremities than in the lower. Malignancies of the trunk are best treated by irradiation.

Osteogenic sarcomas are more frequently found in children, and are usually more malignant and more rapid in growth than in adults, and their expectancy as to life is not so long. This seems logical when we remember that these tumors are most frequently seen in children, not only in areas where the growth is most intense, but also at an age when the growth is most rapid. Treatment is as outlined above.

Primary chondrosarcomas and chondromyxosarcomas are extremely malignant and amputation is the treatment of choice. In spite of the fact that these tumor cells are radiosensitive, irradiation seems to be of little benefit except as a palliative measure, again showing that radiosensitivity and curability are not synonymous terms. Such secondary tumors are much less malignant, and their growth is much less rapid. Hence, the prognosis is better for longer life, though treatment is as above.

Ewing's tumor or endothelioma has practically the same prognosis and requires the same treatment as osteogenic sarcoma, except that it responds very readily to irradiation; and if the average span of life is considered, the chances for longer life are better on an average with the former.

Myelomas seldom are amenable to surgery, since they rarely occur singly in areas readily accessible to surgery, hence irradiation is the method of choice. Some support, or even absence of weight bearing, may become necessary, particularly in involvement of the spine, to prevent pathological fractures and collapse. The average span of life is usually a little better with these cases than with osteogenic sarcomas.

Neurosarcomas and fibrosarcomas, though not bone tumors, may invade bone. The former is extremely malignant; the latter grows much less slowly, and should be treated as sarcoma.

Soft tissue tumors, metastasizing into bones, such as cancer, have to be considered largely in a palliative manner, as practically nothing from a therapeutic standpoint can be expected except alleviation of pain by irradiation, which may also give some restraint to the new growth. In the advanced stage complete recumbency may be necessary to prevent collapse, particularly of the involved vertebral bodies.

Summary.—Since benign bone tumors do not metastasize and cause local trouble only, usually in a mechanical way, excision of the tumor mass should give a good prognosis and relieve the local disturbance. Malignant bone tumors have a grave prognosis, and life's span, though definitely limited, may be unquestionably prolonged, and the patient made more comfortable, by adequate measures such as irradiation or amputation, especially in the lower extremities.

* * *

III. X-RAY DIAGNOSIS OF BONE TUMORS

KENNETH S. DAVIS, M.D. (St. Vincent's Hospital, Los Angeles).—The demonstration of a bone tumor on the roentgenogram is usually easily done, but the interpretation of these findings in terms of pathology presents a good example of the limitations of the x-ray in diagnosis. It should always be remembered that the x-ray has no microscopic attachment.

In the roentgenological analysis of bone tumors certain x-ray findings should be given special consideration:

1. The location of the tumor.
2. The point of origin of the tumor—medullary canal, cortex, periosteum, metaphysis or epiphysis.
3. The condition of the bone cortex—thickened, thinned, expanded or destroyed.
4. Presence or absence of periosteal bone production.
5. The invasion of surrounding bone or soft tissues.
6. Is the tumor single or multiple?
7. The presence or absence of metastasis in other parts of the body.

Clinical and laboratory data of aid to the radiologist in the differential diagnosis of bone tumors:

1. The age of the patient (important).
2. Duration of symptoms. (This gives an index of the rapidity of growth of the tumor.)
3. History of trauma.
4. Pain. Unexplained pain in the region of a bone or joint, with or without history of trauma, should call for repeated x-rays at suitable intervals until a definite diagnosis has been made.
5. The size and appearance of the tumor on physical examination.
6. Loss of weight and strength.
7. Anemia.
8. The finding of the primary tumor in cases of suspected bone metastases.

9. Systemic reactions. Fever, leukocytosis, etc., are more apt to occur in the rapidly growing malignant tumors than in benign tumors.

10. Wassermann, especially useful in differentiating between Ewing's tumor and syphilis.

11. Other laboratory data, especially the hemoglobin, the white count, and the urine analysis for Bence Jones albuminuria.

12. Biopsy.

The differential diagnosis between primary benign and malignant bone tumors:

1. Benign tumors are sharply delimited and their borders are smooth, whereas the borders of malignant tumors are hazy and indistinct due to the fact that they infiltrate into the surrounding tissues.

2. Benign tumors which are medullary in origin are slow-growing, taking the path of least resistance, so that they tend to grow up and down the medullary canal rather than toward the cortex. This gives them an oval shape. Eventually they cause an expansion and thinning of the cortex which, however, is always intact.

In malignant tumors the tumor spreads by infiltrating and destroying the cortex instead of expanding it. Their shape is more or less spherical, as they grow equally in all directions.

3. Other findings, such as the presence of metastases in other parts of the body, rapidity of growth, etc., will aid the roentgenologist in the differentiation.

Exostoses.—Exostoses are not true bone tumors, but are simply an irregular extension of normal bone into the surrounding soft tissues. They are characterized by their slow development, by the fact that their structure is that of normal bone and that they blend into the bone at their point of origin, with no break in the continuity of the cancellous bone markings. They may appear in any part of the skeleton, but are most commonly found near the ends of long bones. They are divided into two general groups, depending on their shape: (1) the table top, which is broad and very dense; and (2) the pencil type, which is more or less elongated.

Osteochondroma.—A true bone tumor, containing variable amounts of bone and cartilage. These tumors are attached to the cortex by a pedicle and have a typical cauliflower shape. The typical tumor is sharply delimited, and shows no tendency to invade the surrounding soft tissues.

Multiple Cartilaginous Exostoses.—In this bone affection there is found multiple osteocartilaginous outgrowths from the ends of long bones and from the flat bones. It is probably due to a disturbance in the proliferation and ossification of the bone-forming cartilage. It is a hereditary affection.

Chondroma (Enchondroma).—Benign bone tumors; their origin probably being due to misplaced cartilage cells. They are both medullary and cortical in origin. They cause an irregular, asymmetrical enlargement of bone, are usually multiple, and are most common in the hands and feet. These tumors are less dense than normal bone, are circular-shaped and sharply delimited.

Bone Cysts.—Solitary bone cysts usually occur in the long bones and in the jaw. They are characterized by sharply defined, rounded or oval-shaped areas of rarefication which may or may not be trabeculated. The tumor is generally medullary in origin, causing a thinning and expansion of the cortex which, however, is always intact.

Cysts never occur in the epiphysis: an important differential point from giant cell tumors.

Solitary bone cysts are seldom due to hyperparathyroidism, but before the latter is definitely excluded other bones should be x-rayed.

Giant Cell Tumor.—A benign tumor, usually occurring as a central, single tumor in the ends of long bones, characterized on the roentgenogram by its asymmetrical spherical shape and its tendency to be located in the epiphysis. The cortex is markedly expanded, and in some instances may be perforated; but there is no invasion of the surrounding soft tissues. The tumor is of less density than the surrounding bone and is trabeculated. Its borders in most cases are sharply delimited.

Osteogenic Sarcoma.—Bone sarcoma is a rapidly growing, highly malignant bone tumor, appearing generally as a single lesion in the shaft of a long bone in a relatively young individual. The tumor metastasizes early, usually through the blood stream.

The Bone Tumor Registry recognizes several "anatomic" types of osteogenic sarcoma, although certain of these groups cannot be distinctly differentiated on the roentgenogram.

1. Osteolytic sarcoma: A destructive tumor arising in the region of the marrow cavity in the shaft of the long bones, characterized on the roentgenogram by a central, more or less spherical area of bone destruction, the tumor dissolving the bone cortex without expansion.

2. Sclerosing sarcoma: A type of osteogenic sarcoma characterized on the roentgenogram by the formation of dense new bone which obliterates the normal osseous markings. This is usually associated with periosteal new bone formation.

3. Periosteal osteogenic sarcoma: This subdivision is still recognized by the Bone Tumor Registry, although there are very few cases in which the periosteum is the only point of involvement. On the roentgenogram there is seen a tumor completely surrounding an intact bone shaft. The tumor remains encapsulated by the periosteum for some time. Erosion of the cortex occurs only in the later stages of the disease. The diagnostic feature is the presence of strands of osseous material radiating throughout the tumor at right angles to the shaft, producing a characteristic "sun ray" appearance.

4. The Undifferentiated type: Characterized by irregular patchy areas of bone destruction. This form closely simulates certain types of bone metastases.

Ewing's Tumor.—This tumor, as seen on the roentgenogram, is most often diffuse and situated near the mid-shaft region of a long bone. There is usually noted an expansion of the shaft with periosteal new bone formation, which in structure resembles onion peel. Later the cortex becomes thickened and shows an increase in its density. Ninety-five per cent of all reported cases are between four and twenty-five years of age.

The exact diagnosis in most of these tumors is seldom made without a biopsy.

Multiple Myeloma.—A rather uncommon form of primary bone tumor characterized by the presence of many foci in the bone marrow of adults. The ribs, skull, spine, pelvis, and the upper ends of the humerus and femur are sites of predilection. The typical roentgenographic findings consist in multiple, small areas of rarefication which are circular in shape and usually sharply defined. As the disease progresses it becomes more and more similar to metastatic carcinoma in its appearance. Bence Jones albuminuria in the urine occurs in 60 per cent of these cases. In the skull there are often found multiple "punched out" circular-shaped areas, different in appearance from bone metastases.

Bone Metastases.—There are two types of metastases to bone recognizable on the roentgenogram:

Osteoclastic (osteolytic) metastases characterized by irregular multiple bone destruction, with a normal bone outline and no evidence of invasion of surrounding soft tissues.

The one exception is in the metastases from hypernephroma, in which invasion does occur.

Osteoplastic metastases: A form of metastasis of slow development, characterized by production of dense bone around the growth. This type is usually primary in prostatic carcinoma. The bones most commonly involved are the pelvis, sacrum, and lumbar spine.

"*Sight Begins at Forty.*"—Properly cared for, the eyes of the middle-aged may be as efficient as they ever were in youth, Dr. Ellice M. Algar points out in an article entitled "Sight Begins at Forty," published in *The Sight-Saving Review*, quarterly journal of the National Society for the Prevention of Blindness. Doctor Alger is professor of ophthalmology at the New York Postgraduate Medical School and the winner of the 1938 Leslie Dana Gold Medal for his lifelong work for the prevention of blindness and the conservation of vision.

"Most people enter the period of middle life with a feeling of profound discouragement," says Doctor Alger. "They are increasingly conscious that they can no longer do things as well or as easily as they once did, and the joy of accomplishment has gone out of them. Ambitions have failed of realization or have proved disappointing. Health itself, instead of being effortless and automatic, requires a conscious or subconscious attention that it never did before.

"One of the most discouraging things about the whole period is the gradual failure of the eyes, which are a very essential factor in a contented and useful middle age. For age brings its own eye problems quite different from those of youth. The eyes tire sooner than they did and vision is not so automatically clear. The acute inflammations and infections are not so common as in youth, but they have a greater tendency to become chronic.

"But the picture is not by any means as drab as it seems. As a matter of fact, much can be done to mitigate these discomforts and postpone these changes and cure these diseases. Properly cared for, the eyes of the elderly are often more efficient and less troublesome than they ever were in youth.

"The young child has the keenest of distance vision and at the same time he can thread a tiny needle or read the finest print held within three or four inches of the eyes. He can do this because he has a lens in his eye as clear as crystal and as elastic as live rubber, so that it adjusts to near or far vision without effort. As he gets older the lens remains transparent, but it becomes more and more inelastic. He still sees perfectly at a distance, but his near point recedes steadily.

"By the time he is forty-five he can just about read fine print. He begins to hold his book farther away than is comfortable, and laughingly says that his eyes are all right but his arms are too short. He requires stronger and stronger light. If he is compelled to use his eyes too much, they get tired—he goes to sleep over his book and blames his dinner; or he gets an eyeache or a headache. There is a long list of aches and pains that follow the forcing of tired eyes.

"To this universal physiological inability of the aging eyes to focus, we give the name 'presbyopia,' or 'old sight.' Ordinarily it begins some time in the early forties, but if one is farsighted or astigmatic, it comes earlier. If one is nearsighted it may not come at all. The eyes of the farmer, or the sailor, or laborer, with little near work to do, may function efficiently long after forty; while ill health or overwork brings it on much earlier.

"But sooner or later most of us have to wear convex glasses which 'magnify' the print and bring it 'nearer' and, in doing so, make near vision sharp, without fatigue. If one is farsighted or astigmatic, the presbyopic correction must be added to that of the distance. There are many persons, especially ladies, who are quite determined that so long as they show no other indication of advancing age they are certainly not going to admit it by wearing glasses. Each year sees a new crop of lotions, drops, tonics, and reading lamps advertised as substitutes for glasses, which are sold to these people.

"One of the great compensations for the onset of 'old sight' is that it results or should result in a complete and careful examination of the eyes, perhaps the first the patient has ever had. There should be a lot more to it than the mere examination for glasses, for the list of diseases that commonly occur in aging eyes is a rather long one. Some of them are rare and some of them very common; some are trivial and self-limited, others are painful and tend to get worse. Some of them threaten sight alone, while a few threaten life itself.

"There is no argument that applies to the annual physical examination of the body which does not apply with equal force to the eyes. The only person who is competent to make this kind of an examination is the eye physician. He has been trained to know and treat diseases whether they involve the eyes alone or the body behind the eyes. His work overlaps on many other specialties. He must have a knowledge of eugenics, pediatrics, neurology, and general medicine. He must always have in mind syphilis, tuberculosis, the toxemias, and the focal infections, and even the various tumors.

"When the sight begins to fail the thing that the average adult dreads more than anything is cataract. He has seen it among his elders, and fears the impairment of vision and perhaps an unsuccessful operation at the end. Many people are as depressed about cataracts as they would be about cancer. And yet in many cases it is not such a terrible thing. It is not necessarily conspicuous and, unless complicated in some way, it is never painful. It occurs in many forms, some due to disease like diabetes or to accident; but for the most part it is the result of perfectly natural senile opacities in the crystalline lens. One of the first things to arouse the physician's suspicion is that, in the beginning, the lens, while still perfectly transparent, swells and makes the patient nearsighted. He often finds that he can again read without glasses, and is very proud of his so-called 'second sight.'

"Perhaps the most serious of eye diseases which threaten people as they grow older is glaucoma. While it is not nearly so common as cataract, it is much more difficult to recognize in its beginning, and it often results in complete blindness in spite of the most careful treatment.

"A careful routine examination of the eyes by one who knows how often reveals unsuspected conditions, like Bright's disease, diabetes, brain tumor, or locomotor ataxia, while there is still time to do something about them—before sight has been irretrievably damaged or the possibility of recovery gone forever."

There is always a certain amount of communicable disease lurking in a community; thus disaster conditions such as recently occurred in the midwestern flooded area throw the door wide open for its spread.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

LOWELL S. GOIN.....Speaker
KARL L. SCHAUPP.....Council Chairman
GEORGE H. KRESS.....Secretary-Treasurer

HOUSE OF DELEGATES MINUTES*

Minutes of the Thirty-Fifth Annual Session of the House of Delegates of the California Medical Association

Held at Hotel Huntington, Pasadena, California, Monday, May 9, 1938, and Wednesday, May 11, 1938

FIRST MEETING

Monday, May 9, 1938

1. **Call to Order.**—The opening meeting of the House of Delegates of the California Medical Association was called to order by Speaker Lowell S. Goin of Los Angeles, in the Ballroom of Hotel Huntington, Pasadena, California, at 8:30 p. m., Monday, May 9, 1938.

Secretary Warnshuis stated that he held signed attendance slips of delegates, and on motion of Eric Larson of Los Angeles, seconded by Edward Pallette, the signed slips constituted the roll call of the House.

* * *

2. **Announcement of Personnel of Reference Committees.**—The Speaker announced the appointment of the following reference committees: *Credentials Committee*, S. J. McClendon of San Diego (chairman), Frank R. Makinson of Alameda, D. T. Caruso of Los Angeles. *Committee on Reports of Officers and Standing and Special Committees*—Dewey R. Powell of Stockton (chairman), Jacob Geiger of San Francisco, Bon O. Adams of Riverside. *Committee on Report of Council and Secretary-Treasurer*—George G. Reinle of Oakland (chairman), Elbridge Best of San Francisco, E. Vincent Askey of Los Angeles. *Committee on Resolutions, New and Miscellaneous Business, and Amendments to the Constitution and By-Laws*—Eric Larson of Los Angeles (chairman), Alson R. Kilgore of San Francisco, Frank MacDonald of Sacramento.

* * *

3. **Address of President Howard Morrow.**—President Howard Morrow then addressed the House, discussing the venereal disease program, the Relief Administration's Farm Security Program, and the completed Medical-Economic Survey. . . .

Action Taken.—Speaker Goin referred the address of the President to Reference Committee No. 2.†

* * *

4. **Report of the Council.**—Chairman Morton R. Gibbons stated that, in accordance with the Constitution and By-Laws of this Association, the Council submits the following as its annual report to the House of Delegates.

The Council has caused the minutes of its many meetings to be published in several issues of the Association's official journal. The Council, therefore, tenders this report in abbreviated form and respectfully refers our delegates to the recorded minutes for specific details. The House will be informed on other counts of business by special committees appointed by the Council for dealing with such subjects. Meetings: The Council held six regular meetings and two special meetings. Minutes of these meetings and the actions recorded are available to reference committees and to the delegates during this session.

ASSOCIATION AFFAIRS.

The Council respectfully directs the attention of the delegates to the following major affairs of the Association. Detailed particulars can be secured from the Council's official minutes.

(a) *Basic Science Law.*—Existing conditions did not justify placing such an initiative on the ballot. The special committee is continued.

(b) *County Hospital Administration.*—The many important problems in this connection have received careful study and consideration by a special committee. This committee is working on a county hospital policy which will be applicable to all counties of the state. The many problems encountered required the appointment of two additional special committees. The Council feels that this issue is of utmost importance to the profession and that these committees should be continued.

(c) *Dog Pound Initiative.*—The important subject, related to medical research, has been given most careful study.

(d) *Hospital Insurance.*—The policy established by the House of Delegates has been observed. The Committee on Public Relations has reviewed proposed plans and the Council has approved three plans:

1. Insurance Association of Approved Hospitals.
2. Associated Hospital Service of Southern California.
3. The Inter-Coast Hospitalization Insurance Association.

(e) *Postgraduate Education.*—The Council has applied the instructions of the delegates. The committee will present a detailed report.

(f) *Venereal Disease Control.*—The Council has cooperated with the State Department of Public Health. President Morrow and a special committee will present a complete report.

(g) *Farm Bureaus and Supervisors' Associations.*—Contact has been established with these organizations upon matters of mutual interest. Two Council committees are now engaged in conferences.

(h) *Pacific Coast Conference.*—The Council initiated and sponsored this conference. Representatives attended from Washington and Oregon.

(i) *Allied Organizations.*—The Council contemplates a fall conference for the discussion of mutual interests. Details are being discussed with hospitals, nurses, druggists and allied groups.

(j) *Malpractice Insurance.*—This vital problem has been the constant concern of the Council. A special committee will report and Mr. Peart has been requested to address you on this subject.

(k) *County Secretaries' Conference.*—This was held in October and was of great value to the county societies and to your officers. It is proposed to hold a yearly meeting.

(l) *Standing Committees.*—The Council has rendered all possible assistance to the Association's standing committees. They are all rendering individual reports.

(m) *Miscellaneous Matters Arising in the Association.* Miscellaneous matters in which the Association was concerned and had Council consideration have been numerous.

* Secretary's Note.—The following is an abstracted digest of the stenographic record of both meetings of the House of Delegates. The official record, in complete detail, is on file in the Secretary's office for further consultation and information.—F. C. Warnshuis.

† Reference Committee No. 2 is the Committee on Reports of Officers, Standing and Special Committees.

(n) *The Economic Survey.*—In compliance with the instructions of the House of Delegates the Council received the report and complied with the federal and state requirements to conclude this Association project.

(o) *Legal Service.*—The Council provided legal counsel service where the Council determined that Association interest deserved intervention.

(p) *Golden Gate International Exposition.*—In joint activity with the American Medical Association the Council has, through a special committee, exercised advisory direction.

THE EXECUTIVE COMMITTEE.

The Executive Committee has held four meetings in the past year. It has supervised the application of the policies of the House of Delegates and the work of standing committees. It has interested itself and given attention to minor matters and to business affairs of the Association. A digest of the meetings has been published.

ADMINISTRATION.

The annual reports of the Secretary-Treasurer and the Auditor convey to you details relating to membership, finances, and the administrative operations conducted through the Association's headquarters, and with which the Council has maintained close contact and supervision.

RECOMMENDATIONS.

The Council submits the following recommendations:

1. The *adoption of clarifying amendments to the disciplinary provisions* of the by-laws as outlined in the appendix of this report. I will read these various recommendations and then turn to the Appendix and read the recommendations in detail.

2. The election of Joseph P. Widney, M.D., to *honorary membership.*

3. That the Association delegates to the 1938 session of the American Medical Association be instructed to introduce the resolution appended to this report: to obtain a *revision and amplification of the principles of medical ethics.*

4. That this House of Delegates declare it to be a policy to be observed by county societies and by members that there be *no sponsorship, endorsement, promotion, or operation of any plan or plans, method or methods, designed to provide or render medical care or services to communities, organizations, industry, or special groups* until such plans and proposals shall have been referred to the Committee on Public Relations, reviewed by that committee, and that committee's findings have been approved by the Council or House of Delegates. The House of Delegates has fixed such a policy with regard to hospital insurance, and the Council believes that a similar plan should be adopted and applied to plans for medical care and service.

5. The Council recommends that the *annual dues for 1939* be fixed at $10 per member.

CONCLUSIONS:

Again the Council invites your attention to the unselfish devotion to duty of county officers and committeemen. No individual has been asked to be relieved of any assignment without cause. Committee work has entailed hardships on committeemen, yet all tasks have been faithfully performed. They, one and all, deserve your thanks. CALIFORNIA AND WESTERN MEDICINE continues to be the outstanding state journal of the country and your editor the most interested and valuable worker for this Association. The General Counsel and his associates have been most active in your behalf. A vast amount of work and detail and personal service with which few of you are acquainted come from his office. The office of the Association has carried on your work smoothly and efficiently. The Secretary-Treasurer and his staff are efficient, prompt, and effective. In fact, your Council repeats, that all of your appointees deserve the appreciation and thanks of the California Medical Association. Permit us to refer now to specific recommendations.

* * *

Amendment to By-Laws.—First, is an amendment to Section 3, Subsection A, Paragraph 6, Chapter 2, of the By-Laws:

Resolved, That Section 3, Subsection A, Paragraph 6, Chapter 2, of the By-Laws of this Association, California Medical Association, be and is hereby amended as follows:

By striking out the second paragraph of said paragraph 6 and *inserting in lieu thereof the following*:

"Either the Council or the Executive Committee of the California Medical Association, whenever it shall come to the attention of either thereof that a disciplinary proceeding is pending before any component county society, may of its own motion, and shall, upon the request of such component county society or of the member or members thereof the subject of any such disciplinary proceeding, appoint a referee who may, but need not be, a member of the California Medical Association, and shall cause the Secretary of the California Medical Association to notify the secretary of such component county society of such appointment. The referee so appointed shall preside at the hearing of said charges and shall make all decisions concerning the admission or rejection of testimony or other evidence and procedure. The referee shall not, however, have any voice nor participate in any manner in the determination by the Board of Directors of the disposition of the charges. During the hearing the referee shall perform all duties normally performed by the presiding officer of the Board of Directors."

* * *

Amendment to By-Laws.—Amendment to Section 3, Subsection 8, Paragraph 7, of Chapter 2 of the By-Laws.

Resolved, That Section 3, Subsection 8, Paragraph 7 of Chapter 2 of the By-Laws of this Association, California Medical Association, be and hereby is amended as follows:

By striking out all of said paragraph 7, reading as follows:

"(7) *Record of Proceedings: Shorthand Reporter Discretionary; Duty of Secretary to Preserve Board Records; Right of Accused to Copy.*—The secretary shall preserve the original of said charges with a certificate of personal delivery or of mailing of a copy or copies thereof, as the case may be, the original notice of the time and place set for the hearing with a certificate of personal delivery or of mailing of a copy or copies thereof, as the case may be, and the original of the answer filed by any member accused if an answer be filed. At the hearing, the Board of Directors may, in its discretion, and at the expense of the Society, employ a competent shorthand reporter to record and transcribe into typewriting testimony adduced on behalf of the accuser and the accused. If the Board shall decide not to employ a reporter, then the secretary of the Society shall be present and shall keep and prepare a summary of all testimony adduced. The original charges with certificate of service thereof, the original notice of time and place for hearing with certificate of service thereof, the answer or answers, may be filed, if any be filed, all documentary evidence introduced at the hearing, all typewritten transcript of the testimony or the secretary's typewritten summary, and the written decision of the Board of Directors shall constitute the record of the entire proceedings. The secretary shall, upon receipt of a sum sufficient to defray the cost thereof, cause a copy of such record to be transcribed and furnished to the accused. The secretary shall keep such record and, in the event of an appeal to the Council of this Association, shall, upon the request of its secretary, transfer said record to the Council."

And by inserting in lieu thereof the following:

"(7) *Record of Proceedings; Shorthand Reporter; Duty of Secretary to Preserve Board Records; Right of Accused to Copy.*—The secretary shall preserve the original of said charges with a certificate of personal delivery or of mailing of a copy or copies thereof, as the case may be, the original notice of the time and place set for the hearing with a certificate of personal delivery or of mailing of a copy or copies thereof, as the case may be, and the original of the answer filed by any member accused if an answer be filed. At the hearing the Board of Directors shall, at the expense of the Society, employ a competent shorthand reporter to record and transcribe into typewriting testimony adduced on behalf of the accuser and the accused, and all rulings made. The original charges with certificate of service thereof, the original notice of time and place for hearing with certificate of service thereof, the answer or answers, if any be filed, all documentary evidence introduced at the hearing, the typewritten transcript of the testimony and the written decision of the Board of Directors shall constitute the record of the entire proceedings. The secretary shall, upon receipt from the accused of a sum sufficient to defray the cost thereof, cause a copy or copies of such record to be transcribed, certified, and furnished to the accused."

Amendment to By-Laws.—Amendment to Section 4 of Chapter 2 of the By-Laws.

Resolved, That Section 4 of Chapter 2 of the By-Laws of this Association, California Medical Association, be and is hereby amended as follows, *by striking out* all of said Section 4, reading as follows:

"Section 4. *Procedure for Appeal to Council.*—A member of a component county society censured, suspended, or expelled by his county society may appeal from the action of such component county society to the Council of this Association within the period of two months succeeding the date of such censure, suspension, or expulsion. Appeals shall be in writing and be filed within the said period of two months in the office of the secretary of this Association. Upon the filing of an appeal the secretary shall present it to the first subsequent meeting of the Executive Committee or the Council. Appeals shall be heard by the Council only after reasonable notice of not less than ten (10) days, in writing, of the time and place of the hearing of the appeal has been given to the appellant member and the president and secretary of the component county society as provided in Section 3 hereof."

And by inserting in lieu thereof the following:

"Section 4. *Procedure for Appeal to Council.*—A member of a component county society censured, suspended, or expelled by his county society may appeal from the action of such component county society to the Council of this Association within the period of two months succeeding the date of such censure, suspension, or expulsion. Appeals shall be in writing and be filed within the said period of two months in the office of the secretary of this Association. Said appeal shall be accompanied by a copy of the record of the entire proceedings before the component county society, duly certified by its secretary, provided the chairman of the Council may, in his discretion, extend the time of the appellant to file said record. Upon the filing of an appeal the secretary shall present it to the first subsequent meeting of the Executive Committee of the Council. Appeals shall be heard by the Council only after reasonable notice of not less than ten (10) days, in writing, of the time and place of the hearing of the appeal has been given to the appellant member and the president and secretary of the component county society as provided in Section 3 hereof."

* * *

Amendment to By-Laws.—An amendment to Section 20, Subsection 2 of Chapter 5 of the By-Laws.

Resolved, That Subsection (a) of Section 20 of Chapter V of the By-Laws of this Association be and is hereby amended by inserting after the phrase "the Committee on Postgraduate Activities," and before the phrase "and the President" in the first paragraph of said subsection, the following: "The Committee on Medical Defense."

* * *

Resolution.—This is a resolution which is provided for in the recommendation of the Council looking toward an alteration improvement in the Code of Medical Ethics of the American Medical Association.

WHEREAS, The Principles of Medical Ethics is the foundation of professional conduct for physicians; and

WHEREAS, Changing times alter tendencies toward interpretation of all ethical rules, although the nature of ethics remains unchangeable; and

WHEREAS, A careful study of the Principles of Medical Ethics makes it apparent that there exists a pressing need for clarification, codification, and amplification of these tested and time-honored rules of conduct; therefore be it

Resolved, That this House of Delegates shall, and hereby does, direct and instruct its delegates to the American Medical Association to prepare and introduce on behalf of the California Medical Association *the resolution attached hereto* calling for the appointment of a special committee to attempt the redrafting, codification, and amplification of the Principles of Medical Ethics, and directing the said committee to report to the House of Delegates of the American Medical Association at its annual session of 1939.

* * *

Resolution:

WHEREAS, The House of Delegates of the California Medical Association has ascertained that, after examination made by the Board of Medical Examiners of the State of California, such boards ascertained the impossibility of verifying credentials of graduates of many foreign medical schools; and

WHEREAS, Such board further ascertained that in many of such foreign schools matriculants were not required to actually attend the same percentage of courses for which they were given credit; and

WHEREAS, Such board further found that graduates of foreign schools did not in general receive medical education equivalent to that demanded of graduates of medical schools of America; and

WHEREAS, Such board concluded that under all circumstances the people of the State of California would be better protected by demanding of foreign graduates such character of education as would tend to require of such graduates a familiarity with the English language, and particularly with American institutions, hospital procedure and medical training; and

WHEREAS, The Board of Medical Examiners recommended the enactment of legislation which, in its opinion, would tend to secure protection for the people of California; and

WHEREAS, The legislature of this state thereafter enacted a law requiring graduates of foreign medical schools applying for medical licenses in this state to (*a*) produce a diploma showing graduation after a resident course from a foreign medical school, (*b*) show that they have been admitted to practice medicine and surgery in the country wherein such foreign medical school is located, and that they (*c*) thereafter completed medical work of the final year in an approved medical school located in the United States, or (*d*) served one year as a resident intern in an approved American hospital; now, therefore, be it

Resolved, That this Association approve the recommendation of the Board of Medical Examiners and the subsequent legislation enacted by the Legislature of California, and so definitely express its endeavor to secure better medical service for the people of this state.

Action Taken.—Speaker Goin stated that the resolutions concerning amendments to the By-Laws, the Code of Ethics, and the Board of Medical Examiners would be referred to the Committee on Resolutions, Amendments to the Constitution and By-Laws, New and Miscellaneous Business, and that the remainder of the report would be referred to the Committee on the Report of the Council and the Secretary-Treasurer.

* * *

5. **Report of Trustees Of The California Medical Association.**—The Secretary, at the request of the President of the Trustees, presented the following report of the Trustees Of The California Medical Association, stating: "This is the report of the certified auditors of the California Medical Association, giving the balance sheet of the Board of Trustees Of The California Medical Association at the close of 1937."

REPORT OF THE AUDITORS

Cash on deposit, commercial accounts	$ 559.27
Saving Accounts:	
Crocker First Federal Trust Company	2,028.99
Bank of America	933.61
San Francisco Bank	728.05
Marketable Securities:	
United States Government securities at cost—quoted market price at $53,342.51, present value	49,306.25
Other Assets:	
Loans to the California Medical Association	31,000.00
Accrued interest on bonds	1,149.42
Accrued interest on savings accounts	75.65
Making a total of assets	$85,781.24
The liabilities are:	
Members' contribution to the Endowment Fund	$ 200.00
The net worth and contributed surplus received from the California Medical Association	75,000.00
The balance earned surplus of	8,926.30
The net income for the past year of	1,654.00
Making a total of	$85,581.24

Action Taken.—Speaker Goin stated that the report would be referred to the Committee on Report of the Council and the Secretary-Treasurer.

* * *

6. **Report of the Auditing Committee.**—At the request of the Speaker, Secretary Warnshuis, on behalf of the Auditing Committee, presented the following budget for 1939:

PROPOSED BUDGET OF AUDITING COMMITTEE

I. *Estimated Income*

Dues, estimated	$59,000.00
Advertising sales, estimated	26,000.00
Extra Journal subscriptions	700.00
Reprint sales	3,000.00
Earned interest	250.00
Addressograph service	150.00
Miscellaneous income	5,000.00
Making a total estimated income for the next year of	$94,100.00

II. *Estimated Expenditures*

Appropriations approved by the Council for consideration by the House of Delegates:	
Rent	$ 3,425.00
Telephone and telegraph	750.00
Postage	750.00
Stationery and printing	1,000.00
Office supplies	500.00
Office expense	300.00
Salaries—Clerical	9,000.00
Salaries—Secretary-Treasurer and Director of the Department of Public Relations	12,000.00
Travel Expense:	
Officers	200.00
Council	1,200.00
Executive Committee	500.00
Secretary	750.00
Delegates to the American Medical Association	300.00
To the Department of Public Relations	3,000.00
To the Council general expense	200.00
To the expense of Postgraduate Conferences	4,000.00
To the committees' expense; that is, standing committees of the Association	1,000.00
To the Committee on Legislation and Public Policy	3,000.00
Expense of annual meeting	2,000.00
To the Legal Department—Retainer	4,000.00
Extra fees	300.00
Extra legal expense	300.00
Subscriptions to libraries; that is, Lane Library and the Los Angeles County Medical Association Library	1,475.00
To printing California and Western Medicine	25,000.00
To postage, California and Western Medicine	1,200.00
To advertising commissions	4,000.00
To discounts on bills receivable	250.00
The editor's salary	4,000.00
Editor's postage and office expense	150.00
Illustrations	700.00
California and Western Medicine—Sundries	400.00
Addressograph service	150.00
Reprint cost	2,000.00
Woman's Auxiliary	200.00
Unappropriated balance	6,000.00
Making a total of	$94,100.00

No appropriations, however, have been made for the Committee on Qualifying Certificate, or for an adverse initiative expense on the next election ballot or for the expenses entailed for the entertainment of the American Medical Association.

Action Taken.—Speaker Goin stated the report of the Auditing Committee would be referred to the Committee on Report of the Council and the Secretary-Treasurer.

* * *

7. **Reports of Special and Standing Committees.**—Speaker Goin stated the reports of Special and Standing Committees had been published in the Pre-Convention Bulletin and would be referred to the Committee on Reports of Officers, Standing and Special Committees.

* * *

8. **Report of the General Counsel.**—General Counsel Hartley F. Peart then addressed the House at length upon medical-legal problems confronting the profession, particularly stressing malpractice liability.

Action Taken.—The Speaker referred the report of the Legal Counsel to the Committee on Reports of Officers, Special and Standing Committees.

9. **Animal Experimentation.**—P. K. Gilman of San Francisco addressed the House upon the pending initiative that would prohibit controlled animal experimentation.

10. **Unfinished Business.**—Amendment to the Constitution, Article VII, Section 1—Election of Councilors.—Speaker Goin referred the proposed amendment to the Committee on Resolutions, New Business, and Amendments to the Constitution and By-Laws.

11. **Introduction of Resolutions.***—(a) *Relationship Between Public and the Medical Profession.* Introduced by Dr. E. Vincent Askey, representing Southern California delegation.

Action Taken.—The Speaker referred resolution (a) to Reference Committee No. 2.†

(b) *New Class of Associate Membership.* Introduced by Dr. Earnest Dozier of Shasta.

Action Taken.—Speaker Goin referred resolution (b) to Reference Committee No. 4.‡

* * *

(c) *Criminal Insane.*—Introduced by Dr. F. E. Toomey of San Diego.

Action Taken.—Speaker Goin referred resolution (c) to Reference Committee No. 4.

* * *

(d) *Place of Annual Sessions, Del Monte.*—Introduced by Dr. Edward B. Dewey of Los Angeles.

Action Taken.—Speaker Goin referred resolution (d) to Reference Committee No. 4.

* * *

(e) *Name of Section on Industrial Medicine and Surgery.*—Introduced by Dr. George H. Sanderson of Stockton.

Action Taken.—Speaker Goin referred resolution (e) to Reference Committee No. 4.

* * *

(f) *Study of Fees in Contract Practice.*—Introduced by Dr. William R. Molony, Sr., of Los Angeles.

Action Taken.—With the consent of the House, since the text of the exact resolution was not available, the Speaker referred resolution (f) to the Committee on Resolutions, Amendments to the By-Laws, and New and Miscellaneous Business, without having first been read in full to the House.

* * *

12. **In Memoriam.**—At the request of the Speaker, the House rose in tribute to the late members of the Association who had died during the past year.

* * *

13. **Approval of Minutes.**—The Speaker of the House, the Chairman of the Council, and the Secretary were authorized to edit the minutes of the House of Delegates.

* * *

14. **Recess.**—After announcement of the place of the meetings of the various Reference Committees, the Speaker declared the House in recess until 8 p. m. Wednesday, May 11, 1938.

* * *

SECOND MEETING

Wednesday, May 11, 1938

1. **Call to Order.**—The meeting was called to order by Speaker Goin at 8:15 p. m. Dr. S. J. McClendon, Chairman of the Committee on Credentials, made a final report and recommended that 151 delegates constitute the roll call in the House for this session. This motion was duly supported and carried.

* * *

2. **Place of Next Annual Session.**—The Secretary reported that the Council had recommended that the next annual session be held in Del Monte in 1939, time to be fixed by the Council. Upon motion duly made and supported, this action was approved.

* * *

3. **Election of Officers:**

(a) *President-Elect.*—Dr. George G. Reinle of Oakland placed a nomination for the office of president-elect in the name of Charles Alfred Dukes of Alameda. There being no other nominations, Doctor McClendon moved, and supported by Doctor Shepherd, that the Secretary cast a ballot of the House for Doctor Dukes. The Secretary so cast. The Speaker then declared Charles A. Dukes duly elected to the office of president-elect.

(b) *Speaker.*—Doctor Allison of Los Angeles nominated for speaker, Dr. Lowell S. Goin of Los Angeles. Nomination was supported by several. There being no other nominations, Doctor Remmen of Los Angeles moved that the Secretary cast the ballot of the House for Dr. Lowell

* For convenience of reference, the original resolutions as introduced at the first meeting of the House of Delegates appear in the Reference Committee reports as presented at the Wednesday evening meeting, in order that the action taken by the House thereon may be more easily appreciated.

† Reference Committee No. 2 is Committee on Reports of Officers, Standing and Special Committees.

‡ Reference Committee No. 4 is Committee on Resolutions, Amendments to the Constitution and By-Laws, and New and Miscellaneous Business.

S. Goin. Motion was duly carried, the Secretary did so cast, and the Vice-Speaker declared Dr. Lowell S. Goin elected as speaker of the House for the ensuing year.

(c) *Vice-Speaker.* — Doctor Cushman nominated John Graves for the office of vice-speaker. Nomination was supported by Doctor Nuttall of Los Angeles. There being no further nominations, Doctor Askey of Los Angeles, supported by Doctor Larson of Los Angeles, moved that the Secretary cast the ballot of the House for Dr. John Graves. The Secretary did so cast, and the Speaker then declared Doctor Graves elected as vice-speaker of the House for the ensuing year.

(d) *Councilors.*—On motion, duly supported and ballot legally cast, Dr. Calvert L. Emmons was elected to succeed himself as councilor of the First District. Dr. Axcel E. Anderson was elected to succeed himself as councilor of the Fourth District; Dr. O. D. Hamlin as councilor of the Seventh District; and Dr. Harry H. Wilson of Los Angeles to succeed himself as councilor-at-large; and Dr. Phil K. Gilman of San Francisco, as councilor-at-large to succeed Morton R. Gibbons, whose term of office expired and who declined reëlection.

(e) *Delegates to American Medical Association.*—On nominations duly made and supported, and upon ballots duly cast, the following delegates were elected for a term of two years to the American Medical Association: Dr. George G. Reinle of Alameda County, Dr. E. M. Pallette of Los Angeles County, Dr. Robert A. Peers of Colfax, and Dr. William Molony of Los Angeles County.

(f) *Alternates to Delegates to American Medical Association.*—Nominations duly made and supported, and ballots duly cast, the following were elected as alternate delegates to the American Medical Association: Dr. Frank R. Makinson of Alameda County, Dr. W. H. Kiger of Los Angeles County, Dr. F. F. Gundrum of Sacramento, and Dr. John C. Ruddock of Los Angeles.

* * *

4. **Nominations and Confirmation of Appointments to Standing Committees.**—Secretary Warnshuis reported the following appointments by the Council for membership on standing committees of the Association, and upon motion and ballot duly cast these appointment were confirmed:

Committee on Associated Societies and Technical Groups —Dr. Edwin L. Bruck, term expiring, reappointed.

Committee on Health and Public Instruction—Dr. Fred B. Clark, Long Beach, term expiring, reappointed.

Committee on Hospitals, Dispensaries, and Clinics—Dr. George Dawson, Napa, term expiring, reappointed.

Committee on History and Obituaries—Dr. Frank R. Makinson, Oakland, term expiring, reappointed.

Committee on Industrial Practice—Dr. Morton Gibbons, term expiring, reappointed.

Committee on Medical Defense—Dr. George G. Reinle, Oakland, term expiring, reappointed.

Committee on Medical Economics—Dr. John H. Graves, San Francisco, term expiring, reappointed.

Committee on Medical Education and Medical Institutions—Dr. B. O. Ralston, Los Angeles, term expiring, reappointed.

Committee on Membership and Organization—Dr. E. Vincent Askey, term expiring, Dr. George R. Maner, Los Angeles, appointed to succeed Doctor Askey.

Committee on Postgraduate Activities—Dr. F. E. Clough, San Bernardino, term expiring, reappointed.

Committee on Publications—Dr. Ruggles A. Cushman, Talmage, term expiring, reappointed.

Committee on Public Policy and Legislation—Dr. Junius B. Harris, Sacramento, term expiring, reappointed.

Committee on Scientific Work—Dr. J. Homer Woolsey, Woodland, term expiring, reappointed.

* * *

5. **Presidential Appointments.** — The Secretary announced that President Roblee made the following appointments to the *Cancer Commission*: Orville Meland, A. Herman Zeiler, and Gertrude Moore. On motion duly made and carried, these appointments were confirmed.

6. **Reports of Reference Committees:**

I.

Report of the Committee on the Report of the Council and the Secretary-Treasurer

Dr. George G. Reinle, Oakland, Chairman

(REPORT)

To the Members of the House of Delegates:

Your Committee on Reports of the Council and Secretary-Treasurer submits the following comments on the reports of Council and Secretary-Treasurer, the Editor, the Auditing Committee, Public Relations, and the Trustees Of The California Medical Association.

* * *

Your committee wishes to especially commend the fine manner in which the Council has executed its difficult responsibility during the past year in the performance of the Association duties.

* * *

Your committee notes that the existing conditions made it undesirable to place the proposed *Basic Science Law* on an initiative ballot in November, 1938. Your committee does recommend that a Basic Science Law be pushed to conclusion in the 1940 election if deemed expedient by the Council at that time.

County Hospital Administration.—"The many important problems in this connection have received careful study and consideration by a special committee. This committee is working on a County Hospital policy which will be applicable to all the counties of the state. The many problems encountered required the appointment of two additional special committees. The Council feels that this issue is of utmost importance to the profession of the state and that these committees should be continued."

Your committee recommends adoption of this section of the report.

Dog Pound Initiative.—"This important subject, related to medical research, has been given most careful study."

Your committee notes with gratification that the Council has given this important subject most careful study, and we urge continuous attention to this problem by the Council and each member of this Association.

Hospital Insurance.—"The policy established by the House of Delegates has been observed. The Committee on Public Relations has reviewed proposed plans. The Council approved three plans.

1. Insurance Association of Approved Hospitals.
2. Associated Hospital Service of Southern California.
3. Inter-Coast Hospitalization Insurance Association."

Your committee recommends that this action of the Council be approved.

Postgraduate Education.—"The Council has applied the instructions of the delegates. The committee will present a detailed report."

Your committee has no comment, as the matter will be reported on by another committee.

Venereal Disease Control.—Your committee has no comment, as the matter will be reported on by another committee.

Farm Bureaus and Supervisors' Association.—"Contact has been established with these organizations upon matters of mutual interest. Two Council committees are now engaged in conference."

Your committee notes that attention is being paid to this matter and recommends that this type of activity be encouraged.

Pacific Coast Conferences.—"The Council initiated and sponsored this conference. Representatives attended from Oregon and Washington."

Your committee notes the report of the Pacific Coast Conference of representatives from Oregon, Washington, and California. We recommend that these conferences be continued as deemed wise by the Council.

Allied Organizations.—"The Council contemplates a fall conference for the discussion of mutual interests. Details are being discussed with hospitals, nurses, druggists, and allied groups."

Your committee feels that much good will be derived from a conference of allied groups as contemplated by the Council, and recommends that such a conference be held.

Malpractice Insurance.—"This vital problem has been of constant concern to the Council. A special committee will report, and Mr. Peart has been requested to address you on this subject."

Your committee feels that the Council should give special attention to the study of reducing the incidence of malpractice suits and that the medical defense committee should continue to investigate in conjunction with our legal counsel, with the object in view of having each member of the California Medical Association become a member of the Medical Society of the State of California with the thought that this will in the future be made a qualification for membership.

County Secretaries' Conference.—"This was held in October and was of great value to the county societies. It is proposed to hold one yearly."

Your committee recommends continuance of this policy.

Standing Committees.—"The Council has rendered all possible assistance to the Association's standing committees that are rendering individual reports."

Your committee commends the Council and its efforts, and recommends that they be continued.

California Medical-Economic Survey.—"In compliance with the instructions of the House of Delegates the Council received the report and complied with the federal and state requirements to conclude this Association project."

Your committee notes the report of the Council in regard to the completion of the Economic Survey and recommends to the House of Delegates that this report be accepted as being the final disposition of the matter in compliance with the instructions of the previous sessions of the House of Delegates.

Legal Services.—"The Council provided legal counsel service where the Council determined that Association interests deserved intervention."

Your committee makes no comment on the above as it will be reported on by another committee.

Golden Gate International Exposition.—"In joint activity with the American Medical Association the Council has, through a special committee, exercised advisory direction."

Your committee recommends that this be continued.

Executive Committee.—"The Executive Committee has held four meetings. It has supervised the application of the policies of the House of Delegates and the work of the standing committees. It has interested itself and given attention to minor matters and the business affairs of the Association. A digest of each meeting has been published."

Your committee notes that the Executive Committee has met four times during the interim and we highly recommend this procedure as we feel that frequent meetings of this committee is conducive to the welfare of this Association.

* * *

Recommendation.—"The Council submits the following recommendation: The *election of Joseph P. Widney, M.D., to honorary membership.*"

Your committee recommends the election of Dr. Joseph P. Widney to honorary membership. This suggestion of the Council meets with our hearty approval because of the fact that Doctor Widney is one of the founders of the Los Angeles County Medical Association, Past President of the University of Southern California, an outstanding author, a clergyman of note, and a physician of rare attainments. He has reached the age of ninety-seven years and is still active physically and mentally.

* * *

Recommendation.—"That this House of Delegates declare it to be a policy to be observed by county societies and by members that there be *no sponsorship, endorsement, promotion, or operation of any plan or plans, method or methods designed to provide or render medical care or services to communities, organizations, industry or special groups* until such plans and proposals shall have been referred to the Committee of Public Relations, reviewed by that committee, and that committee's findings and recommendations have been approved by the Council or the House of Delegates. The House of Delegates has fixed such a policy with respect to hospital insurance. The Council believes that similar policy should be adopted and applied to plans for medical care and service."

Your committee recommends adoption of the foregoing.

* * *

Recommendation.—"The Council recommends that the *Annual Dues for 1939* be fixed at $10 per member."

Your committee recommends adoption of the above.

* * *

Conclusions.—Your committee notes that the members of the Council and committees have given of their unselfish devotion to the duties that have been delegated to them and that no individual has asked to be relieved of any assignment without adequate cause and therefore, your committee recommends that the House of Delegates acknowledge their efforts in behalf of organized medicine.

(Motion to adopt as a whole.)

* * *

Report of the Secretary-Treasurer to House of Delegates.—Your committee notes with interest and approval the Secretary-Treasurer's *report on membership,* especially noting that we have gained approximately two members for every one lost, either by delinquency or death. We feel that this is due in great measure to the program of visits to the county associations by general officers of the Association and the councilor of each Councilor District. The committee approves this program and recommends that these annual visits to the county societies be continued.

Your committee recommends that this portion of the report be filed.

* * *

Your committee has carefully reviewed the *Financial Statement submitted by the Council through the Association's Certified Accountants,* Ernst & Ernst, and are gratified to report that the year showed a net operating gain of $30,226.44. This has been accomplished by the reduction in administrative costs to the amount of some $15,000, during the last two years. By reason of this showing, the Council was able to recommend to the House of Delegates the reduction of annual dues from $15 to $10 per year.

Your committee recommends the adoption of this section of the report.

* * *

Your committee calls attention to the members that the headquarters of every member is the office of the Association and the Secretary seeks cause to show service. We heartily endorse the Secretary's expression of appreciation for the loyal, devoted services of all the office personnel. They have been faithful to the duties imposed upon them.

* * *

Your committee hereby suggests that the Secretary's recommendation regarding the permanent headquarters for the Association be given consideration by the Council during the coming year.

* * *

Report of Editor.—Your committee is in accord with the policy of the Publication Committee in emphasizing the function of California and Western Medicine as the expression of organized medicine for the benefit of the medical profession of California.

* * *

Report of Auditor.—After careful consideration of the 1938 budget as presented by the Auditing Committee of the Council, your committee hereby approves its adoption.

* * *

Report of Trustees Of The California Medical Association.—Your committee has examined this report and moves its adoption.

* * *

Report of Committee on Public Relations.—Your committee feels that the Public Relations Department is a very important department in the California Medical Association in disseminating information regarding what medicine is doing for the public.

Your committee notes with gratification the many activities that the Public Relations Department has participated in and we recommend that these activities be continued. We recognize the necessity of creating and maintaining the public good will. Also this committee recommends that, during the Annual Convention, the Public Relations Committee control the release of information which is used for the public press.

* * *

Resolution to Establish a Committee Outlining General Policies of Medical Profession:

In view of the far-reaching changes which are taking place, not only in this country, but throughout the world, in social and economic fields which of necessity touch some matters of health, it seems desirable to make clear some of the general principles which the medical profession regards as of fundamental importance for the safeguarding of the public health and the advancement of scientific medicine.

In a spirit of friendly coöperation with the public, with our law-making bodies, and with our executives, the California Medical Association hopes that it may be of assistance in any proposed modifications of legislation pertaining to matters of health and medical practice:

1. The medical profession has been always and is now not only willing but anxious to do its part in caring for those who are unable to pay for private medical service. Every year hundreds of thousands of dollars worth of medical services are given without any compensation whatsoever, in the general hospitals and other clinics of the State, as well as in their private offices by Doctors of Medicine. The medical profession is anxious to encourage any changes which will improve the quality of services to these low income groups, and only asks that any such changes shall be made in coöperation with the State or county medical societies. There should at all times be available to the private citizen a free choice of physician. The relation of physician to patient is such a personal matter that the best type of service can be rendered only when this relationship is observed.

2. High educational standards are of primary importance in any who practice the healing art. The particular method of treatment is a secondary consideration, provided the practitioner is qualified by adequate training in the fundamental sciences before he undertakes to treat a patient by any means whatsoever.

3. The medical profession is one of the few occupations which is continually attempting to work itself out of a job by discovering the causes of disease and attempting to prevent them. This is accomplished through medical research and for this purpose it is necessary to utilize living beings. Only two choices are available, either humans or lower animals. Since it is obviously impracticable and would be highly undesirable to carry out such experiments on humans, the only alternative is to use animals for such experimental purposes. The prevention and successful treatment of such diseases as syphilis, smallpox, diabetes, and many others too numerous to mention, are directly dependent upon such animal experimentation. Intelligent investigation on the part of the public would reveal the fact that such experimentation is carried out under properly controlled and humane conditions.

4. Since the physical and mental health of an individual is vitally influenced by his economic status, the careful consideration of all proposals for change in our basic economic structure is one of the most important duties of the office of any government official. A reference to history reveals that some of the remedies now suggested for our financial difficulties have been tried in the past and have failed.

5. In an era of profound change and conflicting emotions, it is essential that the progress of medical science shall not be impeded. Perhaps more important than progress is the preservation of knowledge gained through the years.

Therefore, be it hereby *resolved:* That the House of delegates of the California Medical Association instruct the Council of the California Medical Association to prepare at intervals, statements setting forth in general the attitude of the organized medical profession on matters coming within the purview of the State Legislature or under consideration by the people as a whole under initiative and referendum laws. These statements are to be released as the official attitude of our Association in regard to such matters.

Your committee recommends the adoption of this resolution.

George G. Reinle, *Chairman*
Elbridge J. Best
E. Vincent Askey

* * *

II.

Report of the Committee on Officers, Standing and Special Committees

Dr. Dewey R. Powell, Stockton, Chairman

1. *Report of the President.*—The California Medical Association has been most fortunate in having had as its President a man of the fine caliber of Howard Morrow. In spite of many demands on his time—including such important responsibilities as Professor of Dermatology at the University of California Medical School and President of the California State Board of Health, President Morrow has attended every meeting of the Council and Executive Committee and visited eleven county societies. The members of this Association should heed President Morrow's timely warning to carefully consider the motives as well as the soundness of the investigations and conclusions of the sociological experts who would presume to remedy all the existing evils of our social system, and revolutionize the practice of medicine. The President emphasizes the importance of the profession becoming proficient in the diagnosis and treatment of venereal diseases if we are to prevent the taking over of this large and important field by governmental agencies and institutions.

The committee recommends adoption of the report of the President.

2. *Report of the President-Elect.*—The President-Elect, W. W. Roblee, has fulfilled his responsibilities as President-Elect with the same efficiency and thoroughness that he showed as Speaker of the House and member of the Council. We may look forward with absolute confidence to the maintenance of the finest tradition of our profession during the coming year under his leadership.

This committee recommends the adoption of the report of the President-Elect.

3. *Report of the Speaker of the House of Delegates.*—The members of the House of Delegates keenly appreciate the efficient and gracious manner with which Speaker Goin has presided over its meetings. He has also attended every meeting of the Council and Executive Committee and visited many county societies, and fulfilled every duty of his office with his usual thoroughness.

This committee recommends adoption of the report of the Speaker of the House of Delegates.

4. *Report of the Legal Department.*—An unusual number of important legal matters have come before the Association this past year. The Legislature of 1937 enacted the Business and Professions Code. Several sections of which are in effect, a legislative declaration of the public policy which forbids corporations to practice by any means the profession of medicine and surgery.

The legal department has spent much time in the consideration of the legal problems arising in connection with the study of county hospitals; with the legal points involved in the proposed basic science initiative; and in the revision of the By-Laws of the Los Angeles County Medical Association, our largest component county society.

The legal department has prepared many informative and interesting articles for the "Medical Jurisprudence" section of California and Western Medicine, and a proposed Physician's Handbook containing these articles and other valuable information on medical legal problems is in the process of preparation.

Special thought was given during the past year to the study of malpractice insurance and the following important facts seem to be well established:

1. Claims and suits are increasing.

2. The applicable law has broken down in the shifting of the burden of proof to the defendant and the weakening of the bar of the Statute of Limitations.

3. Insurance protection against this risk is more costly.

4. Fewer insurance companies are writing this business.
5. The costs of defense are increasing.

This committee particularly emphasizes the warning of the legal department that every member of this Association engaged in practice should have adequate malpractice insurance protection, and directs your attention to the recommendation that this insurance be obtained in a domestic company, if possible, and if additional coverage is desired, that it be obtained from a reputable broker authorized to write the broad form policy of Lloyd's of London.

The attention of the members of the California Medical Association is directed to the Medical Society of the State of California, an unincorporated association defraying the cost of a personal attorney to such members as desire it who carry at least $5,000 insurance. Additional memberships in this Medical Society of the State of California should be secured to enable it to be of real stabilizing assistance to the insurance companies still doing this business. If continued losses force the remaining carriers from this field the only alternative is formation of an insurance corporation which would mean many legal and financial problems. The recommendation is made that the statutes dealing with expert testimony be carefully revised and that the attention of the Code Commission be directed to changes which would doubtless receive the attention of the Bar and numerous other professional groups and supply trial courts with qualified experts for their direct guidance.

In addition to these more important legal problems just summarized numerous other problems have arisen and legal opinions given. The members of the California Medical Association fully appreciate the importance of its legal department and expresses its appreciation to Mr. Hartley Peart, Hubert T. Morrow, and their associates, for their efficient and gracious coöperation.

This committee recommends adoption of the report of the Legal Department.

5. *Reports of District Councilors and Councilors-at-Large.*—The reports of the District Councilors and Councilors-at-Large give ample evidence that these men have fulfilled their respective duties. The members of the California Medical Association express their keen appreciation of the unselfish service rendered this Association by these councilors.

This committee recommends the adoption of the reports of district councilors and councilors-at-large.

6. *Report of the Executive Committee.*—The Executive Committee of the Council has met monthly during months for which Council meetings were not scheduled. Nine officers and councilors contributed much of their time and judgment in supervising the Association affairs. The Executive Committee has served the Association well.

This committee recommends adoption of the report of the Executive Committee.

7. *Report of Committee on Associated Societies and Technical Groups.*—The Committee on Associated Societies and Technical Groups has done much work contacting dentists, druggists, and other groups. A comprehensive plan has been evolved through group leaders whereby a large number of patients and voters can be quickly contacted in support of legislative measures that our State Association recommends. This Committee has coöperated very closely with the Woman's Auxiliary, whose help is so greatly appreciated and so valuable for our Association.

This committee recommends adoption of the report of the Committee on Associated Societies and Technical Groups.

8. *Report of the Committee on Health and Public Instruction.*—The Committee on Health and Public Instruction directs the attention of the members of this Association to the woeful lack of interest on the part of county society members in any program of public education. They recommend that the House of Delegates direct each county unit to sponsor two or more public meetings each year under the direction of a special local committee charged with this duty. They also recommend that a speakers' group be enrolled and a list of such available speakers and their subjects be maintained by the State Secretary so that they might be assigned to address meetings in their vicinities.

They also recommend that county or local health officers be requested to take suitable steps to sponsor and support public meetings for the purpose of public health education.

This committee recommends that each county unit appoint a special committee to include, wherever possible, the county health officer, or specifically delegate to an existing committee, this important problem of conveying to the public authoritative and scientific health information. We further recommend that this local committee maintain close contact with the State Committee and the Secretary's office so that they may fully avail themselves of accumulative experience in that field and have available the most recent list of speakers and subjects.

This committee recommends adoption of the Report of the Committee on Health and Public Instruction as amended.

9. *A Resolution Introduced by Dr. Vincent Askey* representing a committee from a caucus of Southern California delegates presented a summary of some of the most important problems arising in the *relationship between the public and the medical profession.* It concludes with the resolution that the House of Delegates instruct the Council of the California Medical Association to prepare at intervals, statements setting forth, in general, the attitude of the organized medical profession on matters coming within the purview of the State Legislature or under consideration by the people as a whole under initiative and referendum laws. These statements are to be released as the official attitude of our Association in regard to such matters.

This committee feels that this resolution is most timely in directing the attention of the Council to the necessity of the presentation to the public of the attitude of organized medicine on matters of legislation and public health. Organized medicine too often is put before the public in a purely defensive or apparently obstructive attitude. We should counteract this impression by presenting positive facts and information to more properly present the constructive attitude of our profession in this important matter of conveying to the public correct scientific and medical information.

The committee recommends the adoption of the resolution presented by the Southern California caucus as amended by this committeee.

10. *Report of the Committee on History and Obituaries.* The Committee on History and Obituaries recommends that the Council enlarge the committee so that the State might be divided into districts so that one member of the committee would be responsible for obtaining the history and the proper death notices and obituaries for his particular district.

This committee recommends that the question of getting this data be left to the component county societies in cooperation with the present standing Committee on History and Obituaries. If necessary, the secretaries of the component societies would have special committees appointed for this purpose. Each year the list of those of our colleagues that have passed on brings a keen sense of personal loss as well as an appreciation of the loss sustained by our entire profession and the respective communities in which our departed confreres carried on their activities. The active work of these men is done but the memory and the appreciation will live on.

This committee recommends adoption of the report of the Committee on History and Obituaries as amended.

11. *Report of the Committee on Hospitals, Dispensaries, and Clinics.*—The Committee on Hospitals, Dispensaries, and Clinics has been largely inactive this year, most of the questions arising before it having been considered by the Public Relations Committee.

This committee recommends adoption of the report of the Committee on Hospitals, Dispensaries and Clinics.

12. *Report of the Committee on Industrial Practice.*—The Committee on Industrial Practice calls attention to the decision of the Supreme Court of California which establishes the fact that California Industrial Accident Commission has jurisdiction over all the injuries arising in this State even though the contract of employment was made in another state and even though the employee is only temporarily assigned to work in this State. This obviates any possibility of physicians being required to proceed in other states for compensation for services performed in this State to an employee injured in this State.

This committee recommends adoption of the report of the Committee on Industrial Practice.

13. *Report of the Committee on Medical Defense.*—The Committee on Medical Defense has done a great deal of work in connection with the legal department of our Association in clarifying malpractice insurance policies being offered to the profession in California. Through their efforts the many types of policy offered by surplus line brokers representing Lloyd's of London have now been reduced to one type of policy meeting the full approval of our legal advisers.

The Committee on Medical Defense recommends strongly that consideration be given to the study of causes of malpractice claims as outlined by the Medical Defense Committee of the Los Angeles Medical Society. It is further recommended that there be appointed in every county society a Medical Defense Committee whose duties it shall be whenever a malpractice claim is made or threatened, to investigate the case and advise as to its handling in coöperation with all concerned. The committee recommends that every member of the California Medical Association should be a member of the Medical Society of the State of California, thus assuring full protection of each member's personal interests and strengthening the protection afforded through the insurance carrier.

This committee recommends adoption of the report of the Committee on Medical Defense.

14. *Report of the Committee on Medical Economics.*—The Committee on Medical Economics has been inactive during the year, its problems being referred to the Committee on Public Relations.

This committee recommends adoption of the report of the Committee on Medical Economics.

15. *Report of the Committee on Medical Education and Medical Institutions.*—The Committee on Medical Education and Medical Institutions has considered all matters referred to it by the Association and has coöperated with the Committee on Postgraduate Activities and with the four medical schools in California.

It is the sense of this committee that the matter of postgraduate instruction of the members of the California State Medical Association is of primary importance, and the Committee on Medical Education and Medical Institutions should urge the medical schools of the state to increase the facilities for such instruction accordingly.

This committee recommends adoption of the report of the Committee on Medical Education and Medical Institutions.

16. *Committee on Membership and Organization.*—The attention of the Committee on Membership and Organization has been directed to encouraging the efforts of the various county societies in the continued program of recruiting members. The committee suggests that each county unit make a survey showing the total number of medical men in the county, particularly listing those eligible for membership who do not now belong to our organization. With this knowledge available, it is possible to put on an active campaign to induce these men to join and secure thereby a stronger alliance among all doctors of medicine.

This committee recommends adoption of the report of the Committee on Membership and Organization.

17. *Report of the Committee on Postgraduate Activities.* The Committee on Postgraduate Activities and the Council of the California Medical Association recognize the obligation of this Association to afford opportunity to its members to engage in continuous educational study with a minimum of time and expense. The committee has formulated and prepared a five-year program for graduate study. This program is in the process of revision, as experience shows the need for change and is intended to afford an opportunity to the members of this Association to remain abreast of scientific progress and to apply it in their daily practice.

This committee recommends that the publication of the five-year program as revised be continued.

This committee concurs in the recommendation of Chairman Ruddock that an advisory committee be appointed by the Council, such committee to meet with the Committee on Postgraduate Study at least once a year to properly revise and supplement the program of the Association.

This committee recommends the adoption of the report of the Committee on Postgraduate Activities.

18. *Report of the Committee on Publications.* — The Committee on Publications is in full accord with the physical arrangements of the contents of the official journal and its editorial policy and projected plans.

This committee wishes to emphasize the report of the Committee on Publications in that its comments on the JOURNAL are of particular importance to our membership as to the quality of the articles and the service it renders to medicine. Our official journal has reached an outstanding position in the field of state and regional medical journals, and is giving our membership timely information on economic and political matters as well as scientific information.

This committee recommends the adoption of the report of the Committee on Publications.

19. *The Committee on Scientific Work.*—The Committee on Scientific Work has been responsible for the scientific program for this sixty-seventh annual session. The high quality of the scientific papers and the outstanding personalities of the visiting speakers have contributed to making this a most helpful and instructive session.

The committee renews its recommendations that the House of Delegates give careful consideration to the advisability of selecting places for the holding of annual sessions that provide adequate accommodations for section meetings and scientific exhibits.

This committee feels that it is very unsatisfactory to members of this Association who have assembled from every portion of the state for their annual session to be unable to attend either a general session or section meeting because of the inadequacy of the seating capacity of the meeting place. It is equally unsatisfactory to members who have gone to considerable time and thought to prepare papers and an actual discourtesy to visiting speakers of eminence who have come as our specially invited guests to be compelled to present their papers under conditions that make it difficult for them to be heard and almost impossible to concentrate on the delivery of such paper. Without any reflection whatever upon the Committee on Arrangements of this or previous conventions, the growing size of our organization makes it imperative that the House of Delegates and its Council give most careful consideration for future needs in regard to adequate meeting place for this organization.

This committee appreciates the time and effort spent by the members of the Association who have provided worth while scientific exhibits and urges that medical schools, institutions, and individuals give more attention to providing such exhibits at future sessions.

This committee recommends the adoption of the report of the Committee on Scientific Work as amended.

20. *Report of the Committee on Animal Experimentation.* The report of the Committee on Animal Experimentation is heartily approved.

This committee wishes to emphasize the importance of the report of the Committee on Animal Experimentation and to urge the entire membership of the Association to assist this committee in combating the insidious influences at work against medical scientific investigation. It also approves the motion of the committee that the House of Delegates authorize and instruct each county society composing the California Medical Association to appoint a special committee whose duty it shall be to enlist the support and arouse the interest of all voters in their communities and by proper education cause them to aid in defeating this initiative. These committees, as organized, shall communicate with the secretary of the California Medical Association and the chairman of the Committee on Animal Experimentation for mutual assistance and coördination of activities.

This committee recommends the adoption of the report of the Committee on Animal Experimentation.

21.—*Report of the Cancer Commission.*—The Cancer Commission has done excellent service in bringing to the practicing physicians of the state a comprehensive knowledge of cancer in order that patients may receive the best care at the earliest opportunity. The Cancer Commission may well be proud of its published reports, which have received deserved compliments from national and international authorities. The Cancer Commission recommends that at the present time it appears feasible in California to organize two types of cancer groups. First, a purely diagnostic group in small hospitals and communities, and secondly, a diagnostic and/or treatment group in hospitals and communities where adequate apparatus and equipment

exists. The establishment of such clinics would undoubtedly supplement and make more effective the comprehensive campaign which has long been conducted by the Cancer Commission in the education of the public as to early diagnosis.

This committee recommends the adoption of the report of the Cancer Commission.

22. Report of the Special Committee on a Qualifying Certificate (Basic Science) Law.—This committee calls the attention of the members of this Association to the tremendous amount of investigation and work that has been done in the study of a basic science law for California. This is a progress report, and a continuing study is being conducted by the Committee on a Qualifying Certificate Law. We call the attention of all members of our Association to the importance of this matter and request that they familiarize themselves with the details of the report. We urge that the Council consummate the work of this committee at the earliest possible time, consistent with the legal and financial problems involved.

This committee recommends the adoption of the report of the Committee on a Qualifying Certificate (Basic Science) Law.

23. Report of the Committee on Syphilis.—The report of the Committee on Syphilis calls attention to the Venereal Disease Act passed by the Legislature of 1937, creating the Bureau of Venereal Diseases within the California State Department of Public Health. The system for reporting cases of venereal disease has been simplified and modernized. The policy concerning admissions to clinics has been laid down and general standards of medical care improved. Educational films have been presented to over fifty audiences, and a number of seminars have been held within county societies and distinguished speakers have been provided for continuing education, both of the profession and of the public.

This committee especially emphasizes the importance of the reporting of cases and the adequate investigation of the sources of infection. We recommend the adoption of the report of the Committee on Syphilis.

Respectfully submitted,

COMMITTEE ON REPORTS OF OFFICERS, STANDING AND SPECIAL COMMITTEES.

Dewey R. Powell, *Chairman*
Bon O. Adams
J. C. Geiger

* * *

III.

Report of the Committee on Resolutions, Amendments to Constitution and By-Laws, New and Miscellaneous Business

Dr. E. Eric Larson, Los Angeles, Chairman

Resolution No. 1.—Introduced by F. E. Toomey, San Diego, and

Relating to study of Sections 1026 and 1026a of the California Penal Code:

WHEREAS, The plea of "not guilty because insane" has potentialities for both good and evil; and

WHEREAS, The term "not guilty because insane" may become obnoxious to the thinking public; and

WHEREAS, The claim of insanity may be abused as an "escape" method; and

WHEREAS, The major burden of opinion in proof of insanity devolves upon members of the medical profession; and

WHEREAS, The proof of sanity or insanity usually depends upon very technical evidence; and

WHEREAS, Adverse public regard affects all members of organized medicine; be it

Resolved, By the California Medical Association that a thorough study of Sections 1026 and 1026a of the California Penal Code be instituted by said Association and that recommendations or criticisms be offered in order that the lay public and organized medicine be justly served.

* * *

Your committee recommends that the following substitute resolution be adopted:

WHEREAS, The present provisions of the California Penal Code relating to the plea of "not guilty by reason of insanity" have proved to be of great value in the administration of justice; and

WHEREAS, Experience has proved that the pertinent sections of the Penal Code require still further improvement in order to provide for more thorough and extended examination and observation as a basis for expert medical opinion; now, therefore, be it

Resolved, That the Council is hereby instructed to appoint a committee from this Association and to invite the California Bar Association to appoint a similar committee in order that, through these committees, the two Associations may jointly study Sections 1026 and 1026a of the California Penal Code and that such changes as may appear desirable may be recommended to the legislature.

* * *

Resolution No. 2.—Introduced by George H. Sanderson for Industrial Medicine and Surgery Section, and

Relating to the change of name of the Section.

WHEREAS, The present name of Industrial Medicine and Surgery Section does not truly represent the field covered or desired to be covered by the Section so named; be it

Resolved, That the name of the Section which has been so designated be changed to that of Traumatic and Orthopedic Surgery Section.

GEORGE H. SANDERSON,
Secretary, Industrial Medicine and Surgery Section.

* * *

Since the present title conforms to the Section Organization of the American Medical Association, your committee recommends that the resolution do not pass at this time.

* * *

Resolution No. 3.—*Relating to instructions of the delegates to the American Medical Association, that they introduce a resolution in that House of Delegates, relating to the revision of the Principles of Medical Ethics:*

WHEREAS, The Principles of Medical Ethics is the foundation of professional conduct for physicians; and

WHEREAS, Changing times alter tendencies toward interpretation of all ethical rules, although the nature of ethics remains unchangeable; and

WHEREAS, A careful study of the Principles of Medical Ethics makes it apparent that there exists a pressing need for clarification, codification, and amplification of these tested and time-honored rules of conduct; therefore be it

Resolved, That this House of Delegates shall, and hereby does, direct and instruct its delegates to the American Medical Association to prepare and introduce on behalf of the California Medical Association *the resolution attached hereto* calling for the appointment of a special committee to attempt the redrafting, codification, and amplification of the Principles of Medical Ethics, and directing the said committee to report to the House of Delegates of the American Medical Association at its annual session of 1939.

* * *

The following resolution, referred to above, is to be introduced by our delegates to the American Medical Association:

WHEREAS, The Principles of Medical Ethics is the foundation of professional conduct for physicians; and

WHEREAS, Changing times alter tendencies toward interpretation of all ethical rules, although the nature of ethics remains unchangeable; and

WHEREAS, A careful study of the Principles of Medical Ethics makes it apparent that there exists a pressing need for clarification, amplification, and codification of these tested and time-honored rules of conduct; therefore be it

Resolved, That the Speaker of the House of Delegates shall appoint a Committee of Five to proceed toward the amplification, clarification, codification, and revision of the Principles of Medical Ethics, directing the said committee to report to this House at its session in 1939.

* * *

In view of the rapid changes which are constantly taking place in the field of medical practice, your committee recognizes the necessity for frequent clarification, amplification, and codification of the ethical principles involved in these newer developments for the guidance and advice of physicians in the practice of medicine.

Your committee whole-heartedly recommends that the above resolution pass.

Resolution No. 4.—Introduced by Dr. Earnest Dozier, on behalf of the Shasta County Medical Society, and

Relating to creation of a new class of associate membership:*

WHEREAS, The internal harmony of the California Medical Association and its component county medical societies, and the affection in which they are held by members, and their consequent position in the public estimation, have long been increasingly impaired by continued agitations for and against investigations, endorsements, and coöperative participation by the California Medical Association, its component county medical societies, and its and their members, of and in political forms of so-called "SOCIAL MEDICINE"; and

WHEREAS, The proponents are largely among those elements of the Association that hold, or are directly interested in, professional positions in the so-called "public service," or in full-time teaching staffs of public institutions, where their principal income is legislatively derived from public taxation; and

WHEREAS, The opponents are largely among those engaged in what is commonly termed "the private practice of medicine," with their principal income derived from fees or salaries privately agreed upon between themselves and those who engage their professional services; and such opponents are unalterably convinced that the principal objective of the Association and its component county medical societies should be devotion, in the future, as in the past, to advances in professional harmony and professional ethics and skill among the members so engaged in the private practice of medicine; and

WHEREAS, It is manifestly neither possible nor desirable to amalgamate the conflicting politico-social views and objectives of said proponents and opponents within the Association and its component county medical societies, and the affection in which they are held by their members, with prejudice to their position in the public estimation; now, therefore, be it

Resolved, By the California Medical Association, that it do, at this time, undertake appropriate changes and modifications in its basic laws, so that there shall be, hereafter, two fundamental divisions within it and within its component county medical societies—one of active membership, with exclusive voice and vote in its and their affairs; the other, associate membership, without such voice and vote. And that active membership, including all officers of the Association and its component county medical societies, shall be accorded only to otherwise acceptable doctors of medicine engaged in private practice of medicine, with their principal incomes derived from fees or salaries privately agreed upon between themselves and those engaging their professional services; and that associate membership shall be open to all other otherwise acceptable doctors of medicine residing in California, and that membership in either division of the Association and its component county medical societies may be changed to the other, upon adequate representations of the principal source of income, such being the essence of division.

* * *

Your committee has devoted much time and earnest thought to this resolution. We are convinced that it is introduced with the best intentions and motives for the preservation of the high standards and qualities of the medical service rendered to the people of California by its private practitioners. However, the proposal to divide the membership of the state and component county societies into two classes—(1) active, including those of its members engaged primarily or exclusively in private practice, and (2) associate, including public health officers, full-time clinical staff members of universities, school physicians, and others not engaged in private practice—would place us in the position of dissolving the semblance of unity now established in organized medicine. The California Medical Association recognizes that changing economic and social conditions require changes in the organization of medical services. It is the purpose of the California Medical Association to approach the problems of maintaining the high standards of medical service to the people of this state. We entertain no doubt whatever that there are those among us who for selfish purposes or in the ill-advised zeal of fanaticism, are willing to sacrifice the standards essential to good medical service and hamper the California Medical Association in its efforts to meet the problems presented to us without breaking down these essential standards.

* Resolution unanimously adopted by the Shasta County Medical Society, May 2, 1938, for introduction at the 1938 convention of the California Medical Association.

The philosophy underlying this resolution may well be taken to heart and assiduously studied. Even though it seems quite drastic in many particulars, its consideration may furnish the stimulus which will lead to a still better unity of thought and action than now exists.

Because your committee feels that the measure proposed in this resolution would not accomplish the intended purpose, we recommend that it do not pass.

* * *

Resolution No. 5.—Resolution submitted by the Council, and

Relating to the investigation and appraisal of credentials of applicants for licensure from foreign countries:

WHEREAS, The House of Delegates of the California Medical Association has ascertained that, after examination made by the Board of Medical Examiners of the State of California, such boards ascertained the impossibility of verifying credentials of graduates of many foreign medical schools; and

WHEREAS, Such board further ascertained that in many of such foreign schools matrieulants were not required to actually attend the same percentage of courses for which they were given credit; and

WHEREAS, Such board further found that graduates of foreign schools did not in general receive medical education equivalent to that demanded of graduates of medical schools of America; and

WHEREAS, Such board concluded that under all circumstances the people of the State of California would be better protected by demanding of foreign graduates such character of education as would tend to require of such graduates a familiarity with the English language, and particularly with American institutions, hospital procedure and medical training; and

WHEREAS, The Board of Medical Examiners recommended the enactment of legislation which, in its opinion, would tend to secure protection for the people of California; and

WHEREAS, The legislature of this state thereafter enacted a law requiring graduates of foreign medical schools applying for medical licenses in this state to (*a*) produce a diploma showing graduation after a resident course from a foreign medical school, (*b*) show that they have been admitted to practice medicine and surgery in the country wherein such foreign medical school is located, and that they (*c*) thereafter completed medical work of the final year in an approved medical school located in the United States, or (*d*) served one year as a resident intern in an approved American hospital; now, therefore, be it

Resolved, That this Association approve the recommendation of the Board of Medical Examiners and the subsequent legislation enacted by the Legislature of California, and so definitely express its endeavor to secure better medical service for the people of this state.

* * *

Your committee recommends that the House of Delegates adopt the following substitute resolution:

WHEREAS, The House of Delegates is informed by the Board of Medical Examiners of the State of California that it has frequently been found impossible to verify the credentials of applicants for licensure from foreign countries and even that many such credentials have been determined definitely to be fraudulent; and

WHEREAS, In many instances graduates of foreign schools have not received training equivalent to that demanded of graduates of American schools; and

WHEREAS, It is in the public interest that the high standards of medical licensure in California be not broken down; now, therefore be it

Resolved, That the Council is instructed to take such steps as it may to secure further strengthening of the Medical Practice Act to the effect that applicants from foreign medical schools be required to meet the same standards of education and training, both premedical and professional, as are required of graduates of American medical schools, and that subject to the principles enunciated above, an applicant from a medical school in a foreign country may be admitted to practice in California on the same basis and under the same conditions as are imposed by that country on graduates of California medical schools who may apply for admission to practice in that country.

* * *

Resolution No. 6.—Presented in the form of letters from the Los Angeles and San Joaquin County Medical Societies, and

Relating to proposed resolution dealing with rebates to Industrial Insurance carriers:

(Copy)

San Joaquin County Medical Society
December 4, 1938.

Dear Doctor:

Your attention is called to the following action taken by the Board of Directors of the San Joaquin County Medical Society, November 30, 1937, at which time the following motion was passed:

"That the Board of Directors of the San Joaquin County Medical Society go on record against accepting any cutting of fees or rebating of the same from the existing Industrial Fee Schedule to any Industrial Accident Insurance Company."

This action was further amplified at a meeting of the San Joaquin County Medical Society held December 2, 1937, when the following motion was passed:

"That the San Joaquin County Medical Society be placed on record as unalterably opposed to fee splitting or reduction of fees or rebating of fees to the Industrial Accident Insurance Company, that a copy of this resolution be mailed to all members of the San Joaquin County Medical Society and the National Automobile Insurance Company, and that any member accepting work from any insurance company, entailing reductions of fees, splitting of fees or rebating of fees, be referred to the Committee on Ethics and Professional Conduct for such disciplinary action as the committee sees fit."

This action of the Board of Directors of the San Joaquin County Medical Society and of the San Joaquin County Medical Society is called to your attention so that you might govern yourself accordingly.

Yours sincerely,
George H. Rohrbacher, M.D.
Secretary.

* * *

(Copy)

Report of Committee on Industrial Contract and Insurance Practice

To the Council of the
Los Angeles County Medical Association.
1925 Wilshire Boulevard,
Los Angeles, California.

Gentlemen:

The resolution of the San Joaquin County Medical Society as to the fees of Industrial Accident work was approved in principle but the language was not acceptable. The committee recommends that the Council of the Los Angeles County Medical Association go on record as opposed to the acceptance by any member of the Association of fees lower than those appearing on the current Industrial Fee Schedule.

The committee further recommends that the Council of the Los Angeles County Medical Association is opposed to the cutting of fees of the current Industrial Accident Fee Schedule or the rebating of same to any insurance company or its agents, and that a copy of this resolution be printed in the Bulletin. The committee also recommends that a copy of this resolution be presented to the House of Delegates of the California Medical Association at the May meeting in the hope that the State Society may go on record as favoring such a resolution and that proper disciplinary action be provided.

Advisory Committee—Francis X. Ammann, T. Sheridan Carey, John Stephens, W. B. Van Cott.

Respectfully submitted,
William R. Molony, *Chairman*
Edwin B. Plimpton
Donald Cass

* * *

Your committee is informed that this matter is already being actively dealt with by a committee of the Council. We recommend that the House of Delegates reaffirm its position by adopting the following resolution:

Resolved, That the House of Delegates of the California Medical Association is unalterably opposed to the cutting of fees under the current Industrial Accident Fee Schedule or of rebating portions of such fees to any insurance company or its agents; and be it further

Resolved, That such cutting of fees or rebating shall render any member subject to disciplinary action as provided by the Constitution.

Resolution No. 7. — Introduced by Edward Dewey, E. Eric Larson, W. H. Daniel, and Ralph B. Eusden of Los Angeles, and

Relating to sessions at Del Monte for the next five years:

Whereas, The present custom of holding the California Medical Association conventions in various localities is the cause of a certain amount of confusion in the selection of the city and the securing of satisfactory accommodations; and

Whereas, Physicians ordinarily will leave their homes to attend a convention, these same physicians find it difficult to free themselves of the responsibilities of practice while at home, thus materially interfering with their attendance at the meetings; and

Whereas, There are few localities in the state which can provide satisfactory accommodations; and

Whereas, Del Monte is centrally located in the state and none of the above objections apply; and

Whereas, The Del Monte Properties Company propose to build an auditorium if we will plan to hold our conventions there for the next five years; now, therefore, be it

Resolved, That this House of Delegates of the California Medical Association recommend to the Council of the California Medical Association that the annual convention be held at Del Monte for five years, beginning in 1939.

* * *

Committee's Comment.—It is apparent that contracts or other obligations would be required of both parties. Furthermore, your committee desires to call attention to the fact that the California Medical Association annual convention is an important asset to the various communities where meetings have been held, and consideration should be given to the matters of policy involved.

Your committee recommends that this resolution be referred to the Council with power to act.

* * *

Proposed Amendments

I. Amendment to Section 20, Subsection (a), of Chapter V of the By-Laws:

Resolved, That Subsection (a) of Section 20 of Chapter V of the By-Laws of this Association be and is hereby amended by inserting after the phrase "the Committee on Postgraduate Activities," and before the phrase "and the President" in the first paragraph of said subsection, the following: "The Committee on Medical Defense."

Your committee suggests that to carry out the intent of this amendment, a companion amendment of paragraph (b) of the same section should be passed at the same time as follows:

Resolved, That Subsection (b) of Section 20 of Chapter V of the By-Laws of this Association be and is hereby amended by inserting after the phrase "the Committee on Postgraduate Activities," and before the phrase "and the Cancer Commission," the following: "the Committee on Medical Defense."

II. Amendments to the By-Laws, proposed by the Council:

Amendments are proposed to Sections 3 and 4 of the Constitution, dealing with disciplinary procedure, as follows:

(a) Amendment to Section 3, Subsection (a), Paragraph (6) of Chapter II of the By-Laws:

Resolved, That Section 3, Subsection (a), Paragraph (6), of Chapter II of the By-Laws of this Association, California Medical Association, be and is hereby amended as follows:

By striking out the second paragraph of said Paragraph (6) and inserting in lieu thereof the following:

"Either the Council or the Executive Committee of the California Medical Association, whenever it shall come to the attention of either thereof that a disciplinary proceeding is pending before any component county society, may of its own motion, and shall, upon the request of such component county society or of the member or members thereof the subject of any such disciplinary proceeding, appoint a referee who may, but need not be, a member of the California Medical Association, and shall cause the Secretary of the California Medical Association to notify the secretary of such component county society of such appointment. The referee so appointed shall preside at the hearing of said charges and shall make all decisions concerning the admission or rejection of testimony or other evidence and procedure. The referee shall not, however, have any voice nor

participate in any manner in the determination by the Board of Directors of the disposition of the charges. During the hearing the referee shall perform all duties normally performed by the presiding officer of the Board of Directors."

(b) **Amendment to Section 3, Subsection (a), Paragraph (7) of Chapter II of the By-Laws:**

Resolved, That Section 3, Subsection (a), Paragraph (7), of Chapter II of the By-Laws of this Association, California Medical Association, be and is hereby amended as follows:

By striking out all of said Paragraph (7), reading as follows:

"(7) *Record of Proceedings; Shorthand Reporter Discretionary; Duty of Secretary to Preserve Board Records; Right of Accused to Copy.*—The secretary shall preserve the original of said charges with a certificate of personal delivery or of mailing of a copy or copies thereof, as the case may be, the original notice of the time and place set for the hearing with a certificate of personal delivery or of mailing of a copy or copies thereof, as the case may be, and the original of the answer filed by any member accused if an answer be filed. At the hearing, the Board of Directors may, in its discretion, and at the expense of the Society, employ a competent shorthand reporter to record and transcribe into typewriting testimony adduced on behalf of the accuser and the accused. If the Board shall decide not to employ a reporter, then the secretary of the Society shall be present and shall keep and prepare a summary of all testimony adduced. The original charges with certificate of service thereof, the original notice of time and place for hearing with certificate of service thereof, the answer or answers, may be filed, if any be filed, all documentary evidence introduced at the hearing, all typewritten transcript of the testimony or the secretary's typewritten summary, and the written decision of the Board of Directors shall constitute the record of the entire proceedings. The secretary shall, upon receipt of a sum sufficient to defray the cost thereof, cause a copy of such record to be transcribed and furnished to the accused. The secretary shall keep such record and, in the event of an appeal to the Council of this Association, shall, upon the request of its secretary, transfer said record to the Council."

And by inserting in lieu thereof the following:

"(7) *Record of Proceedings; Shorthand Reporter; Duty of Secretary to Preserve Board Records; Right of Accused to Copy.*—The secretary shall preserve the original of said charges with a certificate of personal delivery or of mailing of a copy or copies thereof, as the case may be, the original notice of the time and place set for the hearing with a certificate of personal delivery or of mailing of a copy or copies thereof, as the case may be, and the original of the answer filed by any member accused if an answer be filed. At the hearing the Board of Directors shall, at the expense of the Society, employ a competent shorthand reporter to record and transcribe into typewriting testimony adduced on behalf of the accuser and the accused, and all rulings made. The original charges with certificate of service thereof, the original notice of time and place for hearing with certificate of service thereof, the answer or answers, if any be filed, all documentary evidence introduced at the hearing, the typewritten transcript of the testimony and the written decision of the Board of Directors shall constitute the record of the entire proceedings. The secretary shall, upon receipt from the accused of a sum sufficient to defray the cost thereof, cause a copy or copies of such record to be transcribed, certified, and furnished to the accused."

(c) **Amendment to Section 4 of Chapter II of the By-Laws:**

Resolved, That Section 4 of Chapter II of the By-Laws of this Association, California Medical Association, be and is hereby amended as follows:

By striking out all of said Section 4, reading as follows:

"Section 4. *Procedure for Appeal to Council.*—A member of a component county society censured, suspended, or expelled by his county society may appeal from the action of such component county society to the Council of this Association within the period of two months succeeding the date of such censure, suspension, or expulsion. Appeals shall be in writing and be filed within the said period of two months in the office of the secretary of this Association. Upon the filing of an appeal the secretary shall present it to the first subsequent meeting of the Executive Committee or the Council. Appeals shall be heard by the Council only after reasonable notice of not less than ten (10) days, in writing, of the time and place of the hearing of the appeal has been given to the appellant member and the president and secretary of the component county society as provided in Section 3 hereof."

And by inserting in lieu thereof the following:

"Section 4. *Procedure for Appeal to Council.*—A member of a component county society censured, suspended, or expelled by his county society may appeal from the action of such component county society to the Council of this Association within the period of two months succeeding the date of such censure, suspension, or expulsion. Appeals shall be in writing and be filed within the said period of two months in the office of the secretary of this Association. Said appeal shall be accompanied by a copy of the record of the entire proceedings before the component county society, duly certified by its secretary, provided the chairman of the Council may, in his discretion, extend the time of the appellant to file said record. Upon the filing of an appeal the secretary shall present it to the first subsequent meeting of the Executive Committee of the Council. Appeals shall be heard by the Council only after reasonable notice of not less than ten (10) days, in writing, of the time and place of the hearing of the appeal has been given to the appellant member and the president and secretary of the component county society as provided in Section 3 hereof."

Your committee recommends that these amendments be adopted.

* * *

Recommendations to the Council of the California Medical Association

Woman's Auxiliary.—The work and influence of the Woman's Auxiliary to the California Medical Association is becoming constantly of greater value and importance.

Your committee believes that the members of the California Medical Association should be brought and kept in still closer contact with the activities of the Auxiliary.

The suggestion is offered that, in addition to other means of accomplishing this, the work of the Auxiliary might well be presented on the program of a general meeting during the California Medical Association convention.

* * *

Medical Press Bureaus.—It is a notorious and a quite generally accepted axiom that the press as it exists today is subjected to criticism in its general policy of publishing common-interest articles or molding the general opinion of the people on important issues.

Either by wilful neglect or misunderstood forces, articles are published in which there is a gross neglect in stating some of the most important issues involved. For the same reason, magnification of issues considered inimical to our profession are constantly before our eyes.

For these reasons your committee recommends that the Council promote a medical press bureau in each county medical society and at each section of the California Medical Association, whose duty it is to form a closer liaison between the editorial staff and the medical profession by advising with and assisting in the clarification of issues affecting the medical sciences, as they arise, and in items of general interest where scientific clarification may be of importance.

* * *

Amendment to Constitution, Article VII, Section 1, Proposed Last Year, to Be Voted on at This Session.* The resolution proposing the amendment is printed on page 59 of the official program.

Your committee believes that discussion of this proposed amendment can best be carried out absolutely frankly and without obscuring fundamental issues in the language customarily employed in reference committee reports. It is our understanding that the proposal was made as a result of a councilor election in which the House of Delegates over-rode the expressed wishes of the delegates of the district concerned.

The question raised by the proposal is this: Shall district councilors represent their districts only and without responsibility to the House of Delegates as a whole, or shall the House of Delegates reserve for itself the right of final approval of election of members of its Council?

This is a matter dealing with the fundamental principles of representation in the governing bodies of the Association and it is the feeling of your committee that it should be placed by us before the House of Delegates without our

* This section of the Committee's Report was deleted. The proposed amendment was voted on as unfinished business, and failed to receive the two-thirds support necessary for adoption.

formal recommendation either that it be adopted or be not adopted.

If, however, the House of Delegates favors the principle of strict district representation as proposed in this amendment, your committee believes that the procedure provided in it is faulty in that it opens the way for abuses which may prove as bad as those it is designed to correct.

A meeting of delegates in a district composed of widely scattered counties, if called prior to the annual California Medical Association convention (as is permitted and apparently intended by the proposed amendment) would, in many cases, almost certainly not be attended by even a majority of the district delegates. The amendment provides no quorum limitation for the meeting of district delegates. It is easy to imagine the selection of a nominee by a very small number of delegates at such a meeting. The election would then be final and binding not only on the House of Delegates but on the other delegates from the district itself.

If the House of Delegates desires to adopt the principle contained in this amendment, we believe it should be redrafted with the above considerations in mind.

Without commitment or recommendation, therefore, regarding the underlying principle of representation involved, your committee recommends that the amendment in its present form do not pass.

* * *

[Above digest of minutes of the meetings of the House of Delegates was submitted by F. C. Warnshuis, Secretary.]

COUNCIL MINUTES*

Minutes of the Two Hundred and Sixty-First Meeting of the Council of the California Medical Association

Held in Room 449 of the Hotel Huntington, Pasadena, California, Sunday, May 8, 1938, at 8 p. m.

1. **Call to Order.**—The meeting was called to order by Chairman Gibbons, with the following members present: President Howard Morrow, President-Elect William Roblee, Past President Edward M. Pallette, Speaker Lowell S. Goin, Chairman of Council Morton R. Gibbons; Councilors Calvert L. Emmons, Carl R. Howson, Louis A. Packard, Axcel E. Anderson, Alfred L. Phillips, Oliver D. Hamlin, Frederick N. Scatena, Henry S. Rogers, Junius B. Harris, C. O. Tanner, William H. Kiger, Harry H. Wilson; Chairman of Public Relations Committee Charles A. Dukes, Editor George H. Kress, Secretary F. C. Warnshuis, General Counsel Hartley F. Peart and his associate, Mr. Howard Hassard.

Absent: Doctors Kelly and Schaupp.

2. **Report of Auditors.**—The Secretary presented the annual audit of the Association's financial accounts as prepared by Ernst & Ernst, certified public accountants, and on motion of Charles Dukes, seconded by Calvert Emmons, the annual audit for the year 1937 was approved.

3. **Budget for 1938-1939.**—The Secretary presented the budget of Association income and expense for the year 1938-1939, as prepared by the Auditing Committee, and approved by the Executive Committee and the Council at previous meetings. There being no additions or corrections, the Secretary was instructed to submit the budget, as presented, to the House of Delegates on Monday evening.

4. **Committee Reports.**—Reports of the Special and Standing Committees of the Association, as published in the Pre-Convention Bulletin, were presented, and there being no objection were approved for presentation to the House of Delegates.

5. **Legal Department.**—In accordance with previous Council action, the General Counsel stated that he was prepared to report verbally to the House of Delegates on Monday.

6. **Report of Council.**—The annual report of the Council, as prepared by the chairman, Morton R. Gibbons, was submitted and discussed section by section, and certain minor changes in wording adopted. (Complete report to be published in Minutes of House of Delegates).

Edward M. Pallette moved that the following provision for amendment to Section 20 of the By-Laws be included in the Council report for presentation and action by the House of Delegates:

Resolved, That Subsection (a) of Section 20 of Chapter V of the By-Laws of this Association be and is hereby amended by inserting after the phrase "the Committee on Postgraduate Activities," and before the phrase "and the President" in the first paragraph of said subsection, the following: "The Committee on Medical Defense."

The motion was seconded by Lowell S. Goin, and the General Counsel was instructed to put the amendment in proper form for inclusion in the Council's annual report to the House of Delegates.

Discussion was had of certain amendments to the By-Laws to provide for the clarification of the present provisions of disciplinary action, as recommended by the Special Committee on Revision of Amendments to the Disciplinary Code, Lowell S. Goin, Chairman.

After full discussion, the General Counsel was instructed to prepare the amendments to Section 3, Subsection (a), Paragraph (6) of Chapter II of the By-Laws; Section 3, Subsection (a), Paragraph (7), of Chapter II of the By-Laws; and Section 4 of Chapter II of the By-Laws.

The Secretary was instructed to present the amended report of the Council for approval at the Monday meeting of the Council.

7. **Press Publicity Committee.**—In accordance with Council action, the Secretary reported that he had appointed as the Press Publicity Committee for the Pasadena session, President Morrow, Chairman of the Council Gibbons, and Secretary Warnshuis.

On motion of Charles Dukes, seconded by Louis Packard, the membership of the Press Publicity Committee was approved.

8. **Exhibit Space.**—The Secretary reported that, in accordance with previous instructions of the Executive Committee, he had provided space for exhibits in the patio of the hotel by the erection of flooring, canvas roofing, and sectional walls.

The action of the Secretary was unanimously approved by the Council.

9. **Committee Members.**—The Council appointed Carl Howson, F. N. Scatena, and Calvert Emmons to review the membership of Standing and Special Committees of the Association and present nominations.

10. **Appeals.**—The Secretary stated that the time of hearing of the appeals of Doctors Ross S. Carter and George Roy Stevenson had been fixed at 2 p. m., Monday, May 9, 1938, in Room 449 of the Hotel Huntington, Pasadena.

The Council agreed that the hearing would include both matters of procedure and evidence.

11. **Adjournment.**—At this point the Council adjourned to meet at 2 p. m., Monday, May 9, at the same place.

MORTON R. GIBBONS, *Chairman.*
F. C. WARNSHUIS, *Secretary.*

* * *

Minutes of the Two Hundred and Sixty-Second Meeting of the Council of the California Medical Association

Held in Room 449 of the Hotel Huntington, Pasadena, California, Monday, May 9, 1938, at 2 p. m.

1. **Call to Order.**—The meeting was called to order by Chairman Gibbons, with the following members present: President Howard Morrow, President-Elect William W. Roblee, Past President Edward M. Pallette, Speaker Lowell S. Goin; Chairman of the Council, Morton R. Gibbons; Councilors Calvert L. Emmons, Carl R. Howson, Louis A. Packard, Axcel E. Anderson, Alfred L. Phillips, Oliver D. Hamlin, Frederick N. Scatena, Henry S. Rogers, Junius B. Harris, C. O. Tanner, William H. Kiger, Harry H. Wilson; Chairman of Public Relations Committee Charles A. Dukes, Editor George H. Kress, Secretary F. C. Warnshuis, General Counsel Hartley F. Peart, and his associate, Mr. Howard Hassard.

Absent: Doctors Kelly and Schaupp.

2. **Appeals.**—The chairman, Morton R. Gibbons, announced that the Council is now convened pursuant to resolution continuing this hearing, adopted at its meeting

* The minutes of the two hundred and sixtieth meeting of the Council of the California Medical Association were printed in the April, 1938, issue of CALIFORNIA AND WESTERN MEDICINE, page 274. Minutes in this series now printed are for the 261st, 262nd, 263rd, and 264th meetings.

held April 2, 1938, at San Francisco, to hear the appeals of Doctors Carter and Stevenson from disciplinary action taken against them by the San Diego County Medical Society.

Hearing of the appeals was then had.

3. **Council's Annual Report.**—The annual report of the Council, as amended, was considered by the Council. The amended sections, including amendments to Section 3, Subsection (a), Paragraph (6), of Chapter II; Section 3, Subsection (a), Paragraph (7), of Chapter II; and Section 4 of Chapter II; Section 20, Subsection (a), Chapter V, of the By-Laws; resolution instructed delegates to the American Medical Association in regard to revision of Principles of Ethics; and county hospitals.

4. **Foreign Graduates of Medicine.**—It was the sense of the Council that the question of graduates of foreign medical schools be discussed with certain members of the House of Delegates, through a committee consisting of Doctors Pallette, Gibbons, and Warnshuis, and that a suitable resolution be prepared for the House of Delegates.

5. **Public Medical Meetings.**—It was moved by Charles Dukes, seconded by Junius B. Harris, that the matter of individuals or small groups of physicians calling public medical meetings be referred to the Committee on Public Relations with the suggestion that it define procedure or custom for the calling of medical meetings without ruling on ethical aspects. Carried.

6. **Representative of Oakland Chamber of Commerce.** It was moved by O. D. Hamlin, seconded by C. A. Dukes, that Mr. Gray, representative of the Oakland Chamber of Commerce, be invited to present convention facilities available at Oakland when the question of the place of the next annual session was discussed. Carried.

Invitations from Santa Barbara, Del Monte, and Sacramento were also to be discussed at that time.

7. **Committee on Scientific Exhibit Awards.**—It was moved by Louis Packard, seconded by Alfred Phillips, that the Chairman of the Council appoint a secret committee to judge the scientific exhibits at the Pasadena session.

Members of the committee named were Doctors Lemuel P. Adams, E. B. Dewey, and Mast Wolfson.

8. **Adjournment.**—At this point the Council adjourned to meet in the same place at 9 a. m., Tuesday, May 10.

MORTON R. GIBBONS, *Chairman.*
F. C. WARNSHUIS, *Secretary.*

* * *

Minutes of the Two Hundred and Sixty-Third Meeting of the Council of the California Medical Association

Held in Room 449 of the Hotel Huntington, Pasadena, California, Tuesday, May 10, 1938, at 9 a. m.

1. **Call to Order.**—The meeting was called to order by Chairman Gibbons, with the following members present: President Howard Morrow, President-Elect William Roblee; Past President Edward M. Pallette, Speaker Lowell S. Goin; Chairman of the Council, Morton R. Gibbons; Councilors Calvert L. Emmons, Carl R. Howson, Louis A. Packard, Axcel E. Anderson, Alfred L. Phillips, Oliver D. Hamlin, Frederick N. Scatena, Henry S. Rogers, Junius B. Harris, C. O. Tanner, William H. Kiger, Harry H. Wilson; Chairman of Public Relations Committee Charles A. Dukes, Editor George H. Kress, Secretary F. C. Warnshuis, General Counsel Hartley F. Peart and his associate, Mr. Howard Hassard.

Absent: Doctors Kelly and Schaupp.

2. **Place of Next Annual Session.**—The Council heard representatives and considered invitations for the next annual session from Oakland, Del Monte, Sacramento, and the Monterey County Medical Society.

Discussion was had of the resolution presented at the House of Delegates on Monday evening inviting the Association to hold its annual sessions at Del Monte for the next five years in consideration of the Del Monte Properties Company providing added special facilities for scientific sections.

Action was deferred pending the arrival of Mr. Stanley of Del Monte.

3. **Society for the Protection of Medical Research.**—Philip K. Gilman, member of the California Society for the Protection of Medical Research, requested that the Association give support to his organization.

It was moved by Harry Wilson, seconded by Junius B. Harris, that the matter be held under consideration for discussion at the first meeting of the Council, following the annual session. Carried.

4. **Department of Employment Fee Schedule.**—The Secretary read the reply received from the Department of Employment in response to his request for information on the type of examination desired by the Department in hearings before its appeals section.

In view of the fact that the information contained in the letter was insufficient to warrant the attempt at preparation of a fee schedule, on motion of Louis Packard, seconded by Carl Howson, the matter was referred back to the Committee on Public Relations with the request that it secure more definite data.

5. **Scientific Programs for Annual Sessions.**—The Secretary suggested that section officers be requested to submit the scientific programs for annual sessions on forms to be supplied them by the Secretary's office, and briefly outlined the form he had in mind.

George H. Kress moved, seconded by Charles A. Dukes, that the suggestion of the Secretary, in regard to form for the submission of scientific programs, receive the sanction of the Council, and the Secretary be authorized to proceed in this manner. Carried.

6. **Reinstatement of Delinquent Members.**—It was moved by Howard Morrow, seconded by Alfred Phillips, that those physicians whose memberships had lapsed on account of delinquency and whose dues have been accepted by county secretaries and received by the State Secretary since April 1, 1938, be reinstated to membership in the California Medical Association. Carried.

7. **Members' Endowment Fund.**—The question of returning to the two members the two $100 contributions which had so far been received for the Members' Endowment Fund was discussed.

It was moved by Edward Pallette, seconded by George Kress, that the moneys be retained as a nucleus for the Fund. Carried.

8. **Financial Statements.**—Financial statements of the Association for the months of January, February, March, and April, 1938, as mailed to all councilors, were approved.

9. **Guest Speaker.**—It was moved by Charles A. Dukes, seconded by Junius B. Harris, that the Secretary announce at the general meeting today the presence of a guest speaker for the Urological Section.

10. **Allied Organizations.**—It was moved by Edward Pallette, seconded by George Kress, that whenever allied organizations or special societies planned to meet at the same time or place as the State Association, their programs be submitted to the Committee on Scientific Work for approval. Carried.

11. **Committee on Migratory Workers.**—The Secretary presented the report of Karl Schaupp, Chairman of the Advisory Committee for Furnishing Care to Migratory Workers, copies of which had previously been mailed to all Council members.

It was moved by Junius B. Harris, seconded by Henry Rogers, that the report of the Committee on Migratory Workers be received and the committee continued. Carried.

12. **Associated Societies and Technical Groups.**—The Secretary read a letter from John V. Barrow, Chairman of the Committee on Associated Societies and Technical Groups, regarding voting strength of the medical profession.

It was the sense of the Council that the letter be received and placed on file.

13. **Medical History.**—A letter from the Works Progress Administration regarding the compilation of a medical history through WPA workers was discussed.

On motion duly made, seconded and carried, the entire matter was referred to the Chairman of the Committee on History and Obituaries, F. R. Makinson, with a request that he report at the first meeting of the Council following the annual session.

14. **Indemnity Defense Fund.**—On nomination of William Kiger, seconded by C. A. Dukes, Lemuel P. Adams of Oakland was elected a member of the Indemnity Defense Fund Board of Trustees for a period of three years.

In accordance with the suggestion of Doctor Adams, the Secretary was instructed to distribute the funds of the Indemnity Defense Fund among several banks so as to

comply with the requirements that provide for insurance of savings accounts by the Federal Government.

15. **Retired Membership.** — The Secretary presented membership data and requests for retired memberships for several members of the Association, as approved and requested by various county societies.

It was moved by Henry S. Rogers, seconded by A. E. Anderson, that retired membership in the California Medical Association be granted to Lyle Graham, Newberry, San Bernardino County Medical Society; John Addison Shreck, Redlands, San Bernardino County Medical Society; George H. McLellan, San Diego, San Diego County Medical Society; William S. Van Dalsem, San Jose, Santa Clara County Medical Society; Chester H. Fairchild, Woodland, Yolo-Colusa-Glenn County Medical Society; Leo L. Meininger, San Francisco, San Francisco County Medical Society; Mary E. Botsford, San Francisco, San Francisco County Medical Society; and Albert L. Derbyshire, Stirling City, Butte County Medical Society. Carried.

The Council's attention was directed to the fact that certain of these members whose illness prevented contact had allowed their dues to lapse, and it was agreed that in such event the retired membership should be retroactive and date from the year in which membership dues were paid.

16. **Greetings.**—The Chairman presented greetings to the Society from the Acting Royal Vice-Consul of Italy and requested that we give publicity at our meeting to the program of the Society on Malariology of Italy.

17. **Legal Department.**—The General Counsel reported on the case of the *People* vs. *Pacific Health Corporation*; the Health Service System of San Francisco; *Lavine* vs. *Doctors Graun and Harder.*

18. **Hospitalization Plan.**—The Secretary presented a letter from Thomas J. Dozier, Secretary of the Contra Costa County Medical Society, with attached draft of a plan of hospitalization drafted by a lay committee.

It was moved by Edward Pallette, seconded by Henry Rogers, that the "Coöperative Hospital Association Plan" of Contra Costa be referred to the Committee on Public Relations for report. Carried.

19. **Journal to American Medical Association Delegates.**—A letter of appreciation for the complimentary copies of the Association JOURNAL was presented.

It was moved by Edward Pallette, seconded by Alfred Phillips, that the custom of sending complimentary copies of CALIFORNIA AND WESTERN MEDICINE to officers and delegates of the American Medical Association be continued. Carried.

20. **Hearing.**—The General Counsel was instructed to review and digest the exhibits and testimony submitted in the San Diego appeals.

21. **Los Angeles County Institutions Commission.**—Doctor Kress requested that the General Counsel be authorized to keep in touch with the representatives of the Los Angeles County Medical Association who are working on the enactment for a County Institutions Commission so that he may help them in preparing an act that would be a desirable model for other counties.

It was moved by Louis Packard, seconded by Alfred Phillips, that Mr. Peart be permitted to act in an advisory capacity on behalf of the California Medical Association. Carried.

22. **Council Meeting.**—The Chairman of the Council stated that the Council would convene at 9 a. m., Wednesday, May 11, 1938, for the consideration of the appeals of Doctors Carter and Stevenson and such other business as may properly come before the meeting.

23. **Adjournment.**—At this point adjournment was taken until 9 a. m., Wednesday, May 11.

MORTON R. GIBBONS, *Chairman.*
F. C. WARNSHUIS, *Secretary.*

* * *

Minutes of the Two Hundred and Sixty-Fourth Meeting of the Council of the California Medical Association

Held in Room 449 of the Hotel Huntington, Pasadena, California, Wednesday, May 11, 1938, at 9 a. m.

1. **Call to Order.**—The meeting was called to order by the chairman, Morton R. Gibbons, with the following members present: President Howard Morrow, President-Elect William Roblee, Past President Edward M. Pallette, Speaker Lowell S. Goin, Chairman of Council Morton R. Gibbons; Councilors Calvert L. Emmons, Carl R. Howson, Louis A. Packard, Axcel E. Anderson, Alfred L. Phillips, Oliver D. Hamlin, Frederick N. Scatena, Henry S. Rogers, Junius B. Harris, C. O. Tanner, William H. Kiger, Harry H. Wilson; Chairman of Public Relations Committee Charles A. Dukes, Editor George H. Kress, Secretary F. C. Warnshuis, General Counsel Hartley F. Peart and his associate, Mr. Howard Hassard.

Absent: Doctors Kelly and Schaupp.

2. **Place of Next Annual Session.**—Mr. Carl Stanley presented the convention facilities of Hotel Del Monte.

On motion duly made, seconded and carried, Hotel Del Monte was selected as the place of the next annual session. Date to be fixed at the next Council meeting.

3. **Standing Committee Memberships.**—Carl Howson, Chairman of the Council's Committee to review memberships of Standing Committees, submitting the report of his committee, which was approved by the Council for submission to the House of Delegates. (See minutes of the House of Delegates.)

4. **Pneumonia Control.**—The Secretary presented the recommendations of the Chairman of the Committee on Public Health and Instruction for an Advisory Committee on Pneumonia Control. After consideration, the matter was referred to the next meeting of the Council.

5. **Cancer Commission.**—Members of the Cancer Commission, whose terms had expired, were reappointed by Doctor Roblee and, in accordance with the wish of Doctor Brunn, he was replaced by Dr. Alson Kilgore.

6. **Appeals.**—It was moved by Calvert L. Emmons, seconded by Charles A. Dukes, that the Council go into executive session for the purpose of considering the appeals of Doctors Carter and Stevenson.

The Chairman stated that the record showed a full quorum present of qualified councilors; Doctor Goin being present, but not participating.

Hearing of the appeals was then continued. The Council recessed at 11 a. m. and reconvened at 2 p. m.

7. **Reconvening of Council.**—At the end of the hearing of the appeals, the Chairman announced that the Council would rise from executive session and consider other business before it.

8. **American Medical Association Meeting.** — The Secretary read a letter from Doctor Goodrich of the Medical Society of the State of New York requesting support for its bid for the 1940 meeting of the American Medical Association. No action taken.

9. **Migratory Workers Committee.**—A telegram addressed to Henry Rogers by the Chairman of the Advisory Committee on Care of Migratory Workers was read, stating that the committee was attempting to adjust the problem of mileage fees.

10. **George D. Maner.**—The Council, on being informed of the illness of George D. Maner, Secretary of the Los Angeles County Medical Association, authorized the Secretary to send a telegram of greetings and regret of his illness.

11. **Adjournment.**—At this point the Council adjourned to meet at 9 a. m., Thursday, May 12, 1938.

MORTON R. GIBBONS, *Chairman.*
F. C. WARNSHUIS, *Secretary.*

* * *

Minutes of the Two Hundred and Sixty-Fifth Meeting of the Council of the California Medical Association

Held in Room 449 of the Hotel Huntington, Pasadena, California, Thursday, May 12, 1938, at 9 a. m.

Note.—The Constitution of the California Medical Association provides that the annual organization meeting of the Council for the election of its officers and employees shall be held on the last day of the annual session. On May 12, 1938, the Council at its organization meeting went into executive session. The minutes of the executive session will be printed in the August issue.

AMERICAN MEDICAL ASSOCIATION SESSION AT SAN FRANCISCO

Six thousand and forty Fellows registered and some two hundred endeavored to register after the closing of the windows on Friday noon. With some 1500 exhibitors and an estimated 2500 of members and friends of Fellows, the San Francisco session of the American Medical Association brought some 11,000 individuals to San Francisco for the week's session. Fifteen years ago the registration was 3754.

The program was carried out without a hitch in any detail. The weather was ideal. On every hand were visitors profuse with praise for the hospitality extended, the enjoyment experienced, and the benefits derived. It was a notable session.

Doctor West: A most satisfactory session, with perfect arrangements.

President Abell: One of the best sessions in the history of the Association.

Will C. Braun, Business Manager: Never saw such pleased exhibitors. One of our best meetings in years.

Many delegates: A fine meeting, ideal arrangements. San Francisco's profession did a fine job. Hospitality was most cordial. This is one of our best meetings.

Many similar quotations could be recorded. The transactions will be published in early issues of the *Journal of the American Medical Association.* Members are urged to read them and become informed as to policies and principles enacted.

Dr. Rock Sleyster of Wisconsin was elected president-elect.

Dr. Olin West was, of course, reëlected secretary.

The two trustees, whose terms expired, were reëlected.

St. Louis was selected for the 1939 annual session.

It was a tremendous task but also a joy to entertain and provide for these distinguished visitors, and San Francisco's profession may well be content that they acquitted themselves so creditably.

ANNUAL SESSION

This issue contains a digest of the official minutes of the Pasadena annual session. The endeavor is made to record the more important actions enacted by the House of Delegates. This supreme governing body, after due deliberation, has handed down the working orders for the coming year—orders, or rather instructions, that must be observed and carried out by officers and committees. There can be no deviations from these instructions. Our Association's activities will be consistent with these instructions because the chosen delegates have declared these to be the wish and desires of the members they represented. It is, therefore, important that all members be familiar with these instructions and policies in order that they may know that their committees and officers are conforming to the implicit instructions of our supreme governing body. Read these instructions carefully and conform to them.

SOME FACTS

In the recently published annual reports of the American Medical Association there are some items of particular interest to California members. The state is credited as having 10,859 licensed physicians, but no one knows how many have retired, are in special work, or hold executive positions. Our own general estimate is that there are 7,000 eligible licensed physicians who could become members of their county and state organizations. We are credited with 5,695 members, but have 6,008. Of this number, 3,855 are Fellows of the American Medical Association. There are 2,692 JOURNAL subscribers in the state. Some 1,500 of these could transfer their subscriptions to fellowship, thereby increasing our total to 5,355. Fellowship dues are the same as subscription. It is a conjecture as to just why members do not change their classification to fellowship.

The American Medical Association has 109,435 members, of which 68,478 are Fellows. This is the highest enrollment ever recorded. It is estimated that there are 169,000 physicians in the states and territories of the Union, and that 75 per cent plus are affiliated with county and state organizations. Certainly an excellent record.

PASSING COMMENT

Farm Administration Security—Under these arrangements county societies have the opportunity to demonstrate that the actual providing and rendering of medical care to government wards can best be administered by our organizational units and that such county medical society supervision is preferable to governmental supervision and direction.

* * *

Venereal Disease.—If our physicians fail to become proficient in the modern treatment of venereal disease; if they fail to diagnose the disease and permit many patients to continue untreated for their infection; if physicians fail to coöperate in this program—then they and they alone are to blame if federal and state agencies step in and take over the care and treatment of all infected persons in government clinics and institutions.

AN INFORMED PUBLIC

Physicians should embrace every opportunity to transmit to the public dependable facts in order to build and mold sound public and private opinion upon public and private health. Similar educational methods should be employed in regard to questions of economics, legislation and medical service proposals.

When people are dependably informed it may be expected that majorities, in place of vocative minorities and propagandists, will determine the wishes and will of the people. After all, an informed public—and they must be rightly informed—will determine the future conditions of medical practice as well as to decide what, if any, changes are to be instituted. Medicine may lead and guide. The decision remains with and will be recorded by the public.*

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

Preventive Medicine

Individual doctors should practice more preventive medicine. Preventive measures should be urged upon parents who are your patients. You fail to meet the trust reposed in you when you do not advise parents to protect their children from preventable infections.

An approved schedule is: Pertussis, age 4 to 6 months; diphtheria at 9 months; vaccination at 12 months; Schick

*All articles listed under the caption, "This Month's Topics," have been written and sent to the Editor by the Association Secretary, Dr. Frederick C. Warnshuis.

* The submitted item which would have followed is referred to the Council for consideration. Pending decision by the Council, its publication is postponed.

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. George G. Reinle of Oakland is the chairman and Dr. George H. Kress is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. George H. Kress, Room 2004, Four Fifty Sutter Street, San Francisco.

test, 18 months or 6 months after the last dose of toxoid; tuberculin test at age of 3, 6, 9, 12 and 15 years. Advise use of iodized salt. Advise annual examination after third year.

* * *

You Must

There are plenty of "musts" in this day and age. Many of the "musts" gall us because they impose upon our time and pry a bit too far in our personal affairs. However, there are certain "musts" that physicians are holden to observe if they desire to stay out of trouble with authorities and the law. To impress them upon members anew the following "musts" are cited:

1. Report immediately to police authorities every patient who presents a "gunshot" or "stab" wound. Also patient injured by body attack or assault.
2. Every case of criminal abortion. Call in able counsel before you administer treatment, and notify police at once.
3. Notify police of every suicide or attempted suicide.
4. Report every contagious disease.
5. Report every birth, even if stillborn and premature.
6. Every narcotic addict seeking to obtain a narcotic prescription.
7. Obtain written consent before performing an autopsy.
8. Obtain written consent from parent or guardian before operating on a minor.

* * *

Physicians and Cultists

The following is from the recent annual report of the Judicial Council of the American Medical Association. Attention is directed to this opinion and ruling for the reason that every month such inquiry is received from several members and hospital officials. It is hoped that members will conform to this opinion:

Many inquiries concerning the relations of the various cults to the regular profession have been received. The inquiries pertain particularly to the osteopath and the optometrist. Some of our members are giving lectures in osteopathic and optometric schools and addresses before their societies. Some members are associated by a common waiting room in offices with them. Some members are by mutual agreement professional associates principally in the field of surgery. There are some instances of partnership in practice. All of these voluntarily associated activities are unethical. Such relations certainly do not "uphold the dignity and honor of (our) vocation" or "exalt its standards." In case of emergency no doctor should refuse a sufferer knowledge or skill which he possesses to the sufferer's harm, but this is quite a different matter from that of a consultant or practitioner who by consulting or practicing with him assists a cultist to establish himself as competent and on the same basis of medical knowledge as a doctor of medicine. By the very nature of the education and training of each, a consultation with a cultist is a futile gesture if the cultist is assumed to have the same high grade of knowledge, training and experience as is possessed by the doctor of medicine. Such consultation lowers the honor and dignity of the profession in the same degree to which it elevates the honor and dignity of the irregular in training and practice. Practicing as a partner or otherwise has the same effect and objection. Teaching in cultist schools and addressing cultist societies is even more reprehensible, for such activities give public approval by the medical profession to a system of healing known to the profession to be substandard, incorrect, and harmful to the people because of its deficiencies. There hardly can be a voluntary relationship between a doctor of medicine and a cultist which is ethical in character.

* * *

Questionnaires—Warning

There seems to be an epidemic of question blanks floating about the country. Propagandists, as well as medical publishers, are flooding doctors with questions seeking to put the profession on record—just as was attempted a few years ago—in regard to cigarettes and liquor. Part is publicity and part to obtain quotable figures.

The warning is given to toss all these blanks and cards in the waste basket. Do not become a party to these unapproved activities. *Answer no blank or question card unless you are certain that they are endorsed by your county and state medical organizations.* In these days this is a safe rule to follow.

COMPONENT COUNTY MEDICAL SOCIETIES

MONTEREY COUNTY

The monthly meeting of the Monterey County Medical Society was held at the Santa Lucia Inn in Salinas on Thursday, June 2, Dr. Curtis B. Gorham presiding. . . .*

It was moved, and seconded, that the Secretary write a letter to Dr. H. G. Wetherill of Monterey, notifying him of an honorary membership in the Monterey County Medical Society.

Applications for membership in the Society, which were approved by the Board of Censors and the members of the county society by ballot, were: Dr. Reinhard Bachrach, Salinas; Dr. Martin McAulay, Monterey; and Dr. Marshall Carter, Carmel. Dr. D. H. De Smet's application was considered, but in view of having left Monterey County before six months' residency, application was refused.

A discussion as to the obsolescence of the Monterey County Medical Society's constitution was held, with the consensus of opinion that it should be revised. A committee was appointed by Doctor Gorham to revise the constitution and by-laws.

Dr. James McPharlin made a motion that our district councilor, Dr. Alfred Phillips, be invited to attend the next regular monthly meeting at the Hotel Del Monte on July 7. The motion was seconded by Doctor Wiebe.

HARRY R. LUSIGNAN, *Secretary.*

*

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was held at the Trocadero in Lodi on June 2. Following a delightful dinner the meeting was opened by President A. C. Boehmer at 8:30 p. m.

On motion of Doctor Powell, reading of the minutes of the previous meeting was dispensed with.

The application of Dr. Dora Ames Lee was read and referred to the Admissions Committee. A letter from the California State Relief Administration requesting a list of physicians who would do work for them similarly to that now being done by the Agricultral Workers' Health and Medical Association was read. It was moved by Doctor Doughty, seconded from the floor, that the California State Relief Administration be advised to increase their fees to the level paid by the Agricultral Workers' Health and Medical Association and that, in the event of this increase in fees, the Society would be happy to furnish a panel for them.

The action of the Board of Directors of the San Joaquin County Medical Society recommending the establishment of the Alpha Chapter of the Medical Academy of Graduate Study was endorsed by the Society.

Dr. Junius B. Harris, Councilor-at-Large from Sacramento, spoke on *Legislative Problems Confronting the California Medical Association.* Dr. F. C. Warnshuis, Secretary of the California Medical Association, spoke on the *State of Organized Medicine in California.*" . . .*

G. H. ROHRBACHER, *Secretary.*

*

SAN MATEO COUNTY

The joint meeting of the San Mateo County Medical Society and the Woman's Auxiliary was held in the main dining room of the Benjamin Franklin Hotel on May 26, with Dr. Hartzell H. Ray presiding.

The Secretary made an announcement concerning the necessity for members who wish to attend the scientific sessions at the American Medical Association meeting in June to obtain a fellowship card prior to the meeting.

Doctor Ray announced the names of the following new members: Doctors Leslie Seeley, Normal Fox, and Werner Glaser. Copies of the constitution were given to Doctors Fox and Seeley, who were present.

* The Council of the California Medical Association will consider the item here omitted. Publication of the item is postponed pending decision by the Council.

Mrs. Benninghoven, President of the Woman's Auxiliary, was introduced and made a few remarks concerning the formation of the local Auxiliary and extended an invitation to the wives of all members of the county society to join the Auxiliary.

Mr. Wheaton H. Brewer was introduced and presented an interesting and informative talk on the early history of San Mateo County. Many interesting facts concerning early medical history were brought out.

Dr. Frederick C. Warnshuis, Secretary of the California Medical Association, was introduced and spoke on the Woman's Auxiliary as an integral part of organized medicine.

Both speakers were enthusiastically received.

J. Garwood Bridgman, *Secretary.*

✲

STANISLAUS COUNTY

The regular monthly meeting of the Stanislaus County Medical Society was held at the Hotel Hughson on Thursday, June 9. Thirteen members were present. Dr. Joseph Azevedo presided.

The minutes of the last meeting were read, and under the heading of "Old Business," Doctor Azevedo outlined an interview with a certain member who had violated the ruling in regard to lodge practice, and also an interview with his associate. The conclusion reached was this: That these doctors were willing to conform if there actually be need for it. Mention was also made of another doctor who had entered into a contract with another lodge who had asked to continued on for a year, as was originally agreed with the lodge. However, a motion was made by Doctor Wilson, seconded by Doctor Husband, that this practice be stopped immediately and that the doctor in question be informed. Doctor DeLappe suggested that the whole matter of lodge practice and the question of discipline connected with it be submitted to the legal department of the California Medical Association to ascertain the rights of the local society in relation to it. . . .

Dr. Hans Hartman gave a report of the meeting of the House of Delegates held in Los Angeles on May 12.

Dr. Radcliff of Modesto and Dr. E. A. Weizer of Oakdale were admitted as new members to the county society.

Having no board of censors, a motion was made by Doctor Wilson that one be elected. Doctor Maxwell, being the only doctor mentioned in the minutes of the meeting, was chosen as one censor, and Doctor Azevedo was authorized to appoint two others.

An interesting talk on *Medical Experiences in China,* illustrated by movies, was given by Dr. Richard E. Strain.

At the close of the meeting two other censors were chosen—Dr. Donald Robertson and Dr. R. S. Hiatt. The selection was made by the president, the secretary, and Doctor Maxwell.

Hoyt R. Gant, *Secretary.*

Whitelock, Thomas Sidney, Sr. Died at San Diego, May 25, 1938, age 75. Graduate of Gross Medical College, Denver, 1899. Licensed in California in 1901. Doctor Whitelock was a member of the San Diego County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

OBITUARY

Fred Baker*
1854–1938

Dr. Fred Baker, an outstanding figure in the professional, civic and cultural development of San Diego, expired at Mercy Hospital, May 16, 1938. He came to our city January 2, 1888, and resided for a time on Seventh Avenue between F and G. streets, which is now in the lower part of the city's business center. Later he moved to Roseville, during the year 1897, and resided in that vicinity until his final illness.

Doctor Baker was a graduate of the University of Michigan, where he obtained his M. D. degree in 1880 and where he met his wife and partner of many years, Dr. Charlotte Baker, who died October 30, 1937. They were associated with practically every movement which was worth while within the city or county of San Diego. Doctor Charlotte Baker assisted at more than a thousand births, and it is said that she attained a record of never having a maternal fatality during that time.

He was a life member of the California Academy of Science, Golden Gate Park, San Francisco (this is the oldest scientific organization in the state); honorary curator of mollusks at the University of California; a former president of the San Diego Society of Natural History; a charter member of the San Diego Yacht Club and of the San Diego Historical Society; past president of the Marine Biological Association; and an ardent prohibitionist—upon this subject he wrote extensively. He was a veteran of many local campaigns and, years ago, served seven years on the Board of Education, six years on the Board comparable to the present City Council, and two years on what then was the normal school board. He was a life member of the Pacific Geographic Society and the Sons of the American Revolution and held the distinction of being one of two persons ever to be reëlected as president of the San Diego County Medical Society. He also served as president of the Southern California Medical Society. He had a marked interest in the natural sciences and was one of five members of the Society of Natural History who, in December, 1916, incorporated the San Diego Zoölogical Society.

Born in Norwalk, Ohio, January 29, 1854, Doctor Baker lived a long, helpful, and happy life. He was well traveled, well read, and greatly respected. Little more can be said save that one of his last remarks was, "I've lived a jolly life."

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. CLIFFORD A. WRIGHT.....President
MRS. FRED ZUMWALT.....Chairman on Publicity
MRS. FRANK H. RODIN....Assistant Chairman on Publicity

Official Notices

REPORT OF MRS. HOBART ROGERS, PRESIDENT

To the Members of the Woman's Auxiliary to the California Medical Association:

One brief year ago I undertook on your behalf the duties of president. Pleased and gratified by the honor bestowed upon me, I felt very humble and a little bewildered by the responsibilities that I had assumed. Now, standing before you to render an accounting of my stewardship, I feel that these very duties and responsibilities have made the past year one of the happiest of my life. Your willingness to work on behalf of the Auxiliary, your loyalty and devotion to its principles, have made my tasks a pleasure.

One of my first duties as president was to attend the National Convention at Atlantic City, where I was invited to give the response to the address of welcome. The value to the incoming president in being able to attend the National convention cannot be overestimated. A concept of our organization in its entirety can best be gained in this way. The benefits of the personal contacts made and the meetings and conferences attended makes one aware of the importance of the State Organization in a unified National program. I returned from the convention with a will and a zest to live up to the reputation established by the California women.

The details of the accomplishments of the year, now about to close, I leave as the privilege of the various chairmen and county presidents to report. The results of our combined efforts can best be appreciated by one who is in a position to view all reports, and these I shall recount to you.

At the beginning of the year, on March 15, 1937, we had seventeen organized counties with a membership of 1,272. On May 1 our membership was 1,863. This represents an increase of 46.5 per cent. Five new counties have been added. In November the counties of Butte and Santa Cruz, with a membership of 13 and 24, respectively, were organized. Both units are getting well established, and we may depend on them to become a real asset to the medical profession and to the community. Tulare County was added to our growing organization in January. They have fifteen capable and enthusiastic members, and we shall hear gratifying reports from them soon. The Merced County Auxiliary was organized in March. We are happy to be able to welcome the Merced unit this year. Merced County has an active county medical society, and the Auxiliary will be a decided gain to them and to the entire state. San Mateo County entered the ranks in May. The enrollment of San Mateo County gives us Auxiliaries in all the coast counties from San Francisco Bay to the southern border, with the exception of Ventura County. Some interest has been aroused there and we are hopeful of having an Auxiliary.

We have coöperated with the newly organized counties by assisting them in the formation of a constitution which conforms in every essential particular to the requirements of the State and National organizations and which provides flexibility to meet the individual needs. Each has been visited and acquainted with the field of the Auxiliary work. This responsibility has been largely carried on by Mrs. Frederick N. Scatena, the able and efficient chairman on organization. Her untiring efforts on behalf of the Auxiliary deserve the highest praise.

Outstanding work has been done in promoting *Hygeia* this year. Fresno County and Marin County each received national honorable mention. The experience of Fresno County was interesting. Eleven subscriptions given to the public library last year were renewed this year by the library board because of the popularity of the magazine. This demonstrates that *Hygeia* has a broad reader appeal and that it will win friends for itself once it has been introduced. Although we had a most satisfactory increase in the number of subscriptions this year, I feel that we should have had many more.

One activity of our Public Relations Department deserves special mention. A number of counties have held reciprocity meetings at which time representatives of lay organizations were invited. In these programs health topics of vital interest to the community were presented. This is a splendid opportunity for disseminating authentic health information and promoting friendliness between the public and the medical profession. It is our hope that more counties will adopt this plan.

We have had four board meetings, with an average attendance of 89 per cent; at the September meeting eight county presidents were present, and in February six attended. The interest of the county presidents in the deliberations of the Board is a most wholesome sign. It provides for an increased responsiveness not only of the county units to State programs, but of State leadership to local problems and to the sentiment of membership. If we

*A recent letter and article from the pen of Doctor Baker appeared in the May issue of CALIFORNIA AND WESTERN MEDICINE, on page 356.

†As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Frank H. Rodin, Assistant Chairman of the Publicity and Publications Committee, 2457 Bay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Rodin and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

have furthered our cause this year it has been due to the hard work, the unified efforts and harmonious coöperation of the Board of Directors and the loyal support of the county units.

A great responsibility faced the Board in the September meeting. It was the unanimous opinion of the Board and the advice of our Advisory Council that the vacancy created by our beloved Dolores Barrow be filled and the work of the Auxiliary proceed without interruption. Mrs. Clifford A. Wright was nominated by Mrs. Benjamin H. Sherman, Councilor from the Second District. Mrs. Wright was the unanimous choice of the Board. I was greatly pleased with their choice, as I am sure you were. The office of president-elect was created to achieve continuity of administration and to provide the incoming president with an opportunity to become acquainted with the personnel and the workings of the State Organization. The president-elect is a member of the Board and chairman of the Finance Committee, and she must, in advance of the meeting, consider her committee chairmen for the following year and prepare a budget for presentation to the House of Delegates. It is manifestly unfair to any woman to be asked to assume the duties of president without serving as a president-elect. It is unfair to the Auxiliary that this important office be left vacant at any time.

In this September Board meeting a Committee on Legislation was authorized and duly appointed. The members of this committee work directly under the supervision of Dr. Junius B. Harris, Legislation Chairman of the California Medical Association. At the request of our Advisory Council we are mobilizing all our strength to combat measures detrimental to scientific medicine in the California Legislature. We do not enter this activity apologetically, for we firmly believe that the interest of the medical profession and the public are identical, and it is our duty not only as Auxiliary members but as good citizens to support the position of scientific medicine. May I urge that our members each acquaint themselves with all the proposed legislation which deals either directly or indirectly with the medical profession so that we may be able to lend our influence in lay groups with which they are affiliated. Correlation of program, public relations and departments of legislation can do much toward the education of our members. We must be informed to educate others.

One of the most pleasant duties of the state president, as well as one of the most arduous, is that of visiting the component county auxiliaries. I have visited twenty of the twenty-two organized county units, traveling some five thousand miles by automobile. I would not have been able to accomplish this had it not been for the kindness and generosity of my good friend and corresponding secretary, Mrs. Charles G. Hall, who accompanied me. In September I visited our northernmost Auxiliary, Lassen-Plumas-Modoc. There I found a loyal group of five women holding high the banner of scientific medicine under great difficulties, two of whom must drive 116 miles through the mountains to attend the meetings. This Auxiliary has increased its membership to nine, an increase of 80 per cent.

I regret that it was physically impossible for me to visit all the counties early in the year. It helps so much to have some personal acquaintance between the State officers and widely separated county leaders. In my visits I attempted to stimulate interest in the mechanics of organization as a foundation for successful coördinated effort in our work and I am convinced of its utility. The enthusiasm at the round-table discussions after each meeting was most gratifying. In each county that I visited I was accorded every courtesy. For your kindness to me I cannot thank you enough. I shall never be able to repay the Auxiliary for the opportunity it has afforded me to meet you and to count you among my friends.

As I prepare to turn over the responsibilities of the office of president to my successor, I regret that I must leave with you problems unsolved and desirable ends unattained. Yet, in a changing world the work of an organization such as ours is incapable of being completed. It rises above the frailties of personalities in a continuous process of adaptation and change. Our cause is best served by the continuous advancement into positions of responsibility of enthusiastic new leaders with original ideas to implement the work. Such leadership inspires me with confidence in the future of the Auxiliary and assures me that our present accomplishment will soon be surpassed. I am sure that you will continue to sustain your State officers in the same sincere and whole-hearted manner in which you have supported me. Thus, uplifted by exalted ideals and supported by sincerity and unity of purpose, our organization shall become a power for rational enlightened progress throughout our state and nation.

Respectfully submitted,

Mrs. Hobart Rogers, *President.*

State News

The ninth annual session of the Woman's Auxiliary to the California Medical Association was held May 9 to 12.

Minutes of the First Session

The first meeting of the ninth annual convention of the Woman's Auxiliary to the California Medical Association was called to order at 9:40 a. m. on May 10, 1938, at the Vista del Arroyo Hotel in Pasadena by the president, Mrs. Hobart Rogers.

Invocation—Reverend Robert Freeman of Pasadena.

Address of Welcome—Mrs. Eliot Alden of Los Angeles.

Response—Mrs. Jack Nicholson of Kern County.

In Memoriam—Mrs. George Calvin gave a short but beautiful service in memory of those members who had passed away during the year: Mrs. J. W. Moore, Mrs. John V. Barrow, Mrs. Isadore B. Dockweiler, Mrs. Clarendon H. Foster, Mrs. Jerry Lacoe, Mrs. George Lund, Mrs. Albert Elliot, Mrs. Charles Durney, Mrs. W. E. Schottstaedt. The service was completed with a violin solo by Mrs. Milton Shutes.

Mrs. Arthur T. Newcomb, Convention Chairman, introduced Mrs. Walter Boyd of Long Beach, who gave details of the entertainment plans.

Mrs. Charles C. Hall reported a total of 195 registrations as of Monday night.

Mrs. Charles A. Dukes of Alameda read the rules of the convention and they were accepted.

Reports of Officers

President's Report.—Mrs. Frederick N. Scatena, First Vice-President, took the chair while the President gave her report. She mentioned the five new county auxiliaries; an increase of 46.5 per cent in state membership and an attendance of 89 per cent at board meetings. Mrs. Phillip S. Doane of Pasadena made a motion that the report be accepted with great appreciation. The motion was seconded and carried.

Treasurer's Report.—Mrs. Harry O. Hund's report showed a balance in the checking account of $1,254.65; savings account of $292.60; library fund, $63.66. The report was ordered filed. The report of the Auditor, read by the Secretary, coincided with that of the Treasurer and was accepted.

Membership and Organization.—Mrs. Frederick N. Scatena reported twenty-two county auxiliaries and six possible ones.

Finance.—Mrs. Clifford A. Wright read the budget proposed for the coming year, and made a motion for its adoption.

Stationery	$ 85.00
Stenographer and clerical help	125.00
Postage	60.00
Telephone and telegraph	35.00
Convention	150.00
Editor and Publicity	350.00
President's discretionary fund	245.00
Membership and organization	100.00
Miscellaneous	30.00
Total	$1,200.00

The budget was adopted by the House of Delegates.

Dues.—The motion was made, and carried, that the dues for the year 1938–1939 remain as in previous years, $1 per capita.

The reports of the following committee chairmen were read and accepted:

Program and Health Education—Mrs. Eliot G. Colby.

Public Relations—Mrs. A. E. Anderson.

Editor and Publicity—Mrs. Fred H. Zumwalt, A beautiful silk banner, the gift of the 1937–1938 *Courier* staff, was presented.

Hygeia—Mrs. Harold Trimble.

Library—Mrs. Benjamin Sherman reported for her committee. She stated that as yet no book plate had been decided upon; that there are fifty-nine books in the library, in addition to the Health plays.

Recommendations—These were printed in the June issue.

Nomination Committee—The President announced the election of Mrs. Harold Trimble and Mrs. Benjamin H. Sherman from the Board for the Nominating Committee. Nominations were asked for from the floor, and the following members were elected: Mesdames John Humber, G. Wendell Olson, and J. R. Walker.

The meeting was adjourned, to be followed by a luncheon in honor of the president, Mrs. Hobart Rogers.

At luncheon the Doane trophy was presented to Lassen-Plumas-Modoc County for an increase in membership of 80 per cent.

* * *

Second General Meeting

The second general meeting was called to order at 9:45 a. m., May 11, 1938, at the Vista del Arroyo Hotel in Pasadena, by the president, Mrs. Hobart Rogers.

Credentials.—Mrs. Charles C. Hall, Chairman of Credentials, reported a total registration of 251.

Roll Call.—Nineteen Board members and sixty-five county auxiliary delegates responded.

The minutes of the first session of the ninth annual convention were read and accepted after corrections had been made.

The report of the historian, Mrs. Frank Edwin Coulter, was read by the Secretary.

District councilors and county presidents reported. Their reports were also accepted.

Resolutions

Report of Resolutions Committee.—The chairman read the following report, presented by Sacramento County:

WHEREAS, The office of president-elect of the Woman's Auxiliary to the California Medical Association became vacant upon the death of our beloved Mrs. John V. Barrow; and

WHEREAS, The Board of Directors in official session in Oakland, September 29, 1937, filled this vacancy by the appointment of Mrs. Clifford Andrews Wright; and

WHEREAS, The gracious acceptance of this appointment merits an appreciation of our gratitude and appreciation; therefore, be it

Resolved, That this House of Delegates, in session this eleventh day of May, 1938, commends the action of the Board of Directors and pledges to Mrs. Wright its utmost confidence and loyal support as president for 1938–1939.

Mrs. Lindemulder moved, Mrs. Phillip Doane seconded, the acceptance of this resolution.

* * *

She then read further:

Resolved, That the Woman's Auxiliary to the California Medical Association, in convention assembled, extend its sincere thanks and grateful appreciation—

1. To Mrs. Hobart Rogers, whose charming personality, combined with her marvelous executive ability, has endeared her to every member of the Auxiliary, and to the members of the Board who have so ably carried their duties to a successful completion;

2. To Mrs. Arthur T. Newcomb and her committee for their difficult work and careful attention, which have done so much for the success of the session and pleasure of the members and guests;

3. To Mrs. Elmer Belt, Chairman of the Musicale, who with her selected group of artists, Mrs. Eva Gruninger Gibson and the Sylvia Noack ensemble, contributed to the success of a delightful evening of music;

4. To the management of the Huntington Hotel and the Vista del Arroyo Hotel for their courtesies;

5. To the Reverend Freeman of Pasadena, who asked God's blessings on our sessions;

6. To the Council of the California Medical Association for their support and coöperation throughout the year;

7. To Dr. Howard Morrow and the members of the Advisory Council of the California Medical Association for their coöperation and support and their sympathetic understanding of our problems as an Auxiliary;

8. To Dr. Lowell S. Goin, Dr. W. W. Roblee, and Dr. E. Eric Larson, for their inspiring messages;

9. To the Los Angeles and Pasadena papers for their coöperation and able presentation of material pertaining to our annual meeting;

10. To Mrs. Milton Shutes and Mrs. W. H. Sargent for the inspiring music during the Memorial Service.

11. To Dr. George H. Kress and Dr. Frederick C. Warnshuis for additional space and courtesies in the publication of Auxiliary news in CALIFORNIA AND WESTERN MEDICINE.

Resolved, That copies of these resolutions be sent by the recording secretary of the convention to the above named, to whom we are deeply indebted, and a copy be placed on file.

(Signed) MRS. F. G. LINDEMULDER, *Chairman*
MRS. A. A. ALEXANDER
MRS. ELIOT ALDEN

Mrs. Lindemulder made a motion that the courtesy resolutions be adopted. The motion carried.

Report of Nominating Committee.—(These names were published in the June issue. See page 465.) There were no nominations from the floor. By *viva voce* vote the candidates proposed by the Nominating Committee were duly elected.

The following were elected district councilors: First District, Mrs. F. G. Lindemulder; Second District, Mrs. Horace H. McCoy; Fourth District, Mrs. J. R. Walker. The other district councilors remain the same as last year.

Mrs. Rogers then presented Mrs. Clifford Andrews Wright, president for 1938–1939, who in turn presented Mrs. E. Eric Larson of Los Angeles, whom she had appointed corresponding secretary. Mrs. Wright was given an enthusiastic welcome.

Incoming officers were introduced by Mrs. Rogers.

Registrations and Credentials.—Mrs. Charles C. Hall gave her final report: Officers, 20; delegates, 64; alternates, 27; members, 152; guests, 4, making a total of 267.

The Secretary read the minutes of this meeting, which were approved as corrected.

The President then thanked her secretary and the Los Angeles Auxiliary for its hospitality and especially for its splendid entertainment.

There being no further business she declared the ninth annual convention of the Woman's Auxiliary to the California Medical Association adjourned.

MRS. H. E. HENDERSON,
Recording Secretary.

News Letter

Dear Auxiliary Members—Greetings:

The greatly anticipated State and National Medical conventions are over and we wend our way to summer vacations and rest. Those who served found happiness in the privilege of serving. Those who were guests enjoyed the entertainment and social events.

It is hoped that each and every one has learned and experienced something that will enrich their life and add to the happiness of living with our fellow beings.

Those who were not able to attend the conventions will find interest in the reports that will be published in these columns in the following issues of CALIFORNIA AND WESTERN MEDICINE.

May we wish you and your dear ones a very happy and restful summer.

Very sincerely yours,
MRS. FRANK H. RODIN.

Component County Auxiliaries

Alameda County

Marking the close of the 1937–1938 year, over one hundred members of the Woman's Auxiliary to the Alameda County Medical Association met at a luncheon at the Clare-

mont Country Club on Friday, May 20. The president, Mrs. A. A. Alexander, presided. At this meeting the mothers of the doctors of Alameda County were honored.

Gladys Steele gave a delightful program of songs in her inimitable style, accompanying herself with grace and skill.

Mrs. A. A. Alexander turned the gavel over to the incoming president, Mrs. Frank Baxter, who presented her Board to the members.

Los Angeles County

The Woman's Auxiliary to the Los Angeles County Medical Association held its regular luncheon meeting on Tuesday, May 24, at the County Medical Building. Mrs. Mark Albert Glaser, vice-president, presided in the absence of the president, Mrs. Eliot Alden.

The guest speaker was Dr. J. M. Flude, western representative of the American Society for the Control of Cancer. His subject was, *Research Work in the Fight Against Cancer.*

The annual reports were read, and the following new officers and directors were installed: Mrs. William H. Leak, president; Mrs. William Boeck, vice-president; Mrs. R. B. Eusden, second vice-president; Mrs. Edward B. Plimpton, recording secretary; Mrs. Robert L. Carroll, corresponding secretary; Mrs. C. G. Stadfield, treasurer; Mesdames M. A. Desmond, Clifton Briggs, Paul Foster, William Daniel, John Martin Askey, and H. Douglas Eaton, directors.

Marin County Auxiliary

The Woman's Auxiliary to the Marin County Medical Society held its last dinner and meeting of the year on Thursday, May 26, at the Marin Golf and Country Club.

After dinner a business meeting was held. Officers were elected for the ensuing year, and final reports of the standing committees were given.

The incoming officers were then introduced as follows: Mrs. Bernard J. Conroy, president; Mrs. Frank Lowe, first vice-president; Mrs. Cornwall C. Everman, second vice-president; Mrs. Harry N. Hensler, recording secretary; Mrs. Louis L. Robinson, treasurer.

Mrs. Thomas Gocher was presented with a silver dish, in appreciation of her splendid achievements as president.

After the meeting the members enjoyed a social evening of bridge. Mrs. Bernard J. Conroy, *Secretary.*

Sacramento County

A luncheon meeting at the Del Paso Country Club marked the closing of the season for the Woman's Auxiliary to the Sacramento County Medical Society on May 24 at 1:00 p. m.

The following officers were elected for the coming year: Mrs. George A. Spencer, president; Mrs. Norris Jones, first vice-president; Mrs. C. B. McKee, second vice-president; Mrs. Richard Schofield, treasurer; Mrs. Wayne Pollock, corresponding secretary; Mrs. Henry L. Saverien, recording secretary. Directors: Mesdames F. N. Scatena, Nathan Hale, W. J. Van Den Berg, and D. Schuyler Pulford. Directors remaining on the Board from the previous year are Mesdames Orrin Cook and Frank Krull.

Bridge was the diversion of the afternoon.

Mrs. George Briggs, chairman of the day's program, was assisted by Mesdames H. F. Schluter, Floyd Schapp, George Joyce Hall, Donald McNeil, M. J. Lipp, Orrin Cook, and Louis Jones. Mrs. H. Carmichael.

San Diego County

The Woman's Auxiliary to the San Diego County Medical Society held a delightful tea in June to welcome the incoming officers in the home of Mrs. Frank Carter on Sixth Avenue.

The new officers installed were: Mrs. C. O. Tanner, president; Mrs. R. Emerson Bond, first vice-president; Mrs. T. M. Cunningham, second vice-president; Mrs. Hiram Newton, secretary; Mrs. Alex Lesem, treasurer; Mrs. Edwin H. Kelley and Mrs. Alfred J. Cooper, members-at-large.

The delegates to the convention of the Woman's Auxiliary to the American Medical Association in San Francisco were Mesdames C. O. Tanner, Hiram Newton, and Willard H. Newman. Mrs. R. Emerson Bond.

Santa Barbara County

The Santa Barbara County Auxiliary held its meeting on April 11 in the Trustees Room of the Public Library. The following officers were elected: Mrs. H. E. Henderson, president; Mrs. Alfred Wilcox, first vice-president; Mrs. O. C. Jones, second vice-president; Mrs. Percy Gray, recording secretary; Mrs. H. C. Findlay, treasurer.

Mrs. John Van Paing reported on the school essay contest which was held from May 1 to June 1 by the pupils of the Junior High School grades of Santa Barbara County. The subject of the essay was chosen by the students from any issue of the *Hygeia* magazine in 1938. A prize of $5 was given to the winner in each school competing.

The Auxiliary voted to pay the expenses of the incoming president to the State and National conventions.

A bridge tea was held on April 21 at the Samarkand Hotel. One hundred and fifty ladies were present and they enjoyed the beautiful garden setting. Mesdames Rexwell Brown, Benjamin Bakewell, Charles Stevens, and C. T. Roome presided at the tea tables. Five lovely daughters of high school age assisted in selling candy. The leader of the Girl Scout Group sponsored by the Auxiliary was also present.

There was no meeting in May due to the State convention. Mrs. H. E. Henderson, *Publicity Chairman.*

Santa Cruz County

The Woman's Auxiliary to the Santa Cruz County Medical Society met on May 9 at the home of Mrs. H. O. Watters in Watsonville.

After a short business meeting the members enjoyed a delicious desert and played bridge during the afternoon. A delightful musical program was given by Mrs. Watters, our hostess, who played the organ, and Mrs. Sonbuck, who played the piano. Mrs. H. B. Wirt, *Secretary.*

Tulare County

The Woman's Auxiliary to the Tulare County Medical Society entertained the lawyers' wives of the county at a buffet supper and bridge party in April in Visalia.

On May 22 the Auxiliary held a dinner business meeting at Estrada's. Dr. K. Weiss and Dr. E. R. Zumwalt were elected honorary members of the Auxiliary. The program for the following year was discussed.

The address given by Dr. E. Eric Larson at the California Medical Association Convention at Pasadena was read by the president, Mrs. McClure. Highlights of the Pasadena convention were reported by Mrs. N. Miller.

Mrs. W. B. Parkinson, *Secretary.*

"Ethically, it is a fundamental fact that the state has the right to protect the lives and health of its people, and inferentially both state and national legislatures regard quarantine as a means of protecting the health of the people from infectious disease. Whether the idea of quarantine is any more than an heritage of history may best be judged by a brief reference to the fact that since the earliest times of mankind to the present day, quarantine, as a principle, has existed in different forms and shapes. The history of quarantine, as known to us, covers a span from Moses to Ellis Island. This governmental self-protection is a medical responsibility, and any hardship it may impose upon the few who seek our shores is greatly outweighed by the guardianship against disease that it gives to the nation."

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

California Northern District Medical Society: Sixty-Third Semi-Annual Meeting.—This meeting of the California Northern District Medical Society, formed in 1891 by the physicians of the Sacramento and North San Joaquin Valleys for the objects "to promote the cultivation and advancement of medical science and to encourage unity and harmony among regular practitioners of medicine," was held at Chico on April 16, with Dr. John H. White of Chico presiding.

The program was as follows:

Preanesthesia Medication, and Anesthesia from a Pharmacologist's Viewpoint, by Dr. Chauncey D. Leake, Professor of Pharmacology, University of California Medical School.

Preanesthesia Medication and Anesthesia from the Anesthetist's Experience, by William Neff, M.D., Stanford Medical School.

The importance of Psychiatry in General Medicine, by Edward W. Twitchell, M.D., San Francisco.

Migrainous Headaches, by George Wever, M.D., Stockton.

Dinner, with forty-two seated, was enjoyed. At the dinner Dr. E. W. Twitchell was honored because of the part he played in the California Northern District Medical Society. He became a member in 1900. He held various offices as follows: Vice-President in 1902; member of the Board of Censors in 1904–1908; president in 1909. He has presented ten papers before the Society, as follows: Clinical Significance of Certain Symptoms Referred to the Nervous System, in 1903; Ulcer of the Stomach—Medical Aspects, in 1904; Terminal Stages of Cardiovascular Disease, in 1905; Transverse Myelitis, in 1906; Renaissance of Physical Diagnosis, in 1907; The Clinics of Europe, in 1908; Test Meals in Diagnosis of Intestinal Disease, in 1910; Poliomyelitis in the Light of Recent Research, in 1911; Infantile Cerebral Paralysis, in 1914; Differential Diagnosis Between Encephalitis and Poliomyelitis, in 1921.

After the dinner Dr. Chauncey D. Leake gave a very stimulating and inspiring address on "California's First Great Scientist, Dr. Robert G. Blake."

The Minute Book of this organization, to a large extent in longhand, and with complete notes, and therefore a very important piece of medical history of California, is being deposited in the History Section of the State Library in Sacramento.

The secretary of the Society is Dr. John Homer Woolsey, Woodland, California.

Western Safety Conference to Meet in Los Angeles. Stop the appalling loss of life on highways. Stop the loss of life from accidental causes in the home and in industry. That is the program for the Western Safety Conference to be held in Los Angeles, September 12 to 16.

Sectional meetings will be held in connection with the Conference, covering the oil industry, aviation, motion picture, industrial safety in all such institutions, traffic, home and public safety. Resolutions will be adopted and final action will be up to the Legislative Committee.

Represented at the Conference will be the states of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, Utah, Nevada, Arizona and New Mexico, as well as British Columbia, Alaska, Hawaii, and Lower California.

Uniform legislation will be projected for the entire territory represented at the Conference. Taking part will be safety experts in every branch of industry, automobile associations, state traffic bodies, schools, service clubs, etc. Therefore, every man, woman, and child in the eleven western states and contiguous territory will be governed by uniform safety regulations, regardless of where they reside or where they travel.

During the Conference, which it is expected will attract more than ten thousand persons, there will be an exhibit of safety appliances, many demonstrations and other features leading only to the thought of providing greater safety to mankind.

Headquarters have been established in the Ambassador Hotel, Room 75, Los Angeles.

Old-Fashioned Drinks Helpful as Cold Remedy.—The old-fashioned "rock and rye" and "hot toddy" concoctions have definite value in the treatment of the common cold, but their consumption can be and often is overdone. The judicious use of alcohol in a hot drink before going to bed, mustard baths and other remedies usually provided in the patient's self-diagnosis are all recommended. But a cold is a widely variable condition in different patients and should be treated on that basis.

These conclusions are stated in one of the most complete and exhaustive treatises on the common cold yet turned out by a western hospital or medical school. It comes from the pen of Dr. William J. Kerr, professor of medicine, and Dr. John B. Lagen, instructor in medicine in the University of California Medical School. Doctor Kerr is also president of the American College of Physicians, which recently concluded its annual meeting in New York City.

The publication, which is issued by the Oxford University Press, New York, traces the history of this bothersome complaint from the time of Hippocrates, the "Father of Medicine," who lived in the fifth century before Christ, to the present day. It also sets forth a number of misconceptions regarding the common cold, the most general of which is that it is supposed to be highly contagious. While this conclusion is held to be tenable in some respects, Doctors Kerr and Lagen present convincing evidence likewise that a cold is not easy to "catch." The possibility of contact infection in both man and monkeys is dealt with at length, and the writers conclude that the burden of proof that a cold is contagious rests upon those who make this claim. They state, however, that some highly contagious diseases, such as measles, start with sneezing, coughing and other common cold symptoms, necessitating strict precautions against spread.

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

New York Polyclinic Medical School and Hospital.—The following men have been appointed to the faculty of the New York Polyclinic Medical School and Hospital: Dr. Joseph F. McCarthy, professor of urology and attending urologist; Dr. Charles J. Imperatori, professor of otolaryngology and attending otolaryngologist; Dr. Joseph E. J. King, professor of neurosurgery and attending neurosurgeon; Dr. Edward H. Dennen, professor of obstetrics and attending obstetrician.

International Physiological Congress.—The absorbing topic of poisons and other drugs in the hands of criminals is to be treated at length by Dr. Chauncey Leake, Professor of Pharmacology and Librarian of the Medical School of the University of California, at the International Physiological Congress which opens in Zurich, Switzerland, on or about August 12. Doctor Leake will tell of these substances as they are being studied in the courses in criminology at the University.

Doctor Leake has already departed for the Congress and for special studies in England, France, and Germany preceding the Zurich meeting.

Dr. James M. D. Olmsted, chairman of the Division of Physiology on the Berkeley campus of the University, is to attend the Congress also and present a paper on Light Adaptation of the Eye.

Santa Clara Controls Rabies.—Since the first of last November, in Santa Clara County, including San Jose, no less than 5,250 stray dogs have been taken into custody. During the seven months, November to May, inclusive, 301 persons were bitten by dogs. One hundred and seven animals were determined rabid by clinical and bacteriological diagnosis. A total of fifty-two persons were bitten by rabid animals, forty-eight dogs and four cats. Eighty-six exposed persons were given the Pasteur treatment for the prevention of rabies.

The program for the control of the disease has gone forward efficiently and swiftly under the direction of Dr. H. C. Brown, City Health Officer of San Jose, and Dr. C. H. Burchfiel, Health Officer of Santa Clara County. With the continued coöperation of residents, it is anticipated that rabies will be stamped out of the community within two months. These health officers and the residents of Santa Clara County, together with local newspapers, are to be congratulated upon the aggressive attack that they are making against this disastrous, but preventable disease.

International Course in Malariology.—This course will be held July 18 to September 17, 1938, in Rome, Italy, Istituto di Malariologia, Ettore Marchiafava, Policlinico Umberto 1.

Topics to be studied include the following: Hematology; Protozoölogy; Malaria Parasites and Microscopic Diagnosis; Pathology of Malaria; Clinic of Malaria; Entomology; Malaria Epidemiology; Malaria Prophylaxis; Survey of a Malarious Area.

Results of malarial treatment of mental diseases.

Lectures.

Practical work and laboratory demonstrations. Work in the wards.

Visits and residence in experimental stations and in a center of induced malaria.

Excursions:

Surroundings of Rome.
Bonification (Improvement) of the Tiber-delta.
Bonification of the Pontine Marshes.
Bonification by natural filling of the River Lamone.
Bonification of Ferrara.
Lagune of Venice.
Sardinia.
Center of Rieti.

Conditions of Admission to the Course:

The course is open exclusively to postgraduate physicians; it is held in French, but one or more interpreters are at disposal. The fee amounts to lire 1,500, and entitles to follow all practical demonstrations, as well as to free travel in connection with the excursions.

Information may be secured from the Vice-Consul for Italy at San Francisco.

Child Guidance Study at Los Angeles Summer Session.—Prominent among the educators arriving from eastern universities to join the summer session faculty of the University of California, Los Angeles campus, is Dr. Percival M. Symonds, professor of education, Teachers College, Columbia University. Doctor Symonds will conduct two courses in Child Guidance studies and will also be the leader in conferences dealing with Child Guidance and Mental Hygiene. The subject for the first conference will be "Emotional Security as the Foundation of Child Guidance." There will be four conferences and the subjects for the remaining three are "Emotional Security in the Teacher." "Studying the Emotionally Insecure Child," and "A Child Guidance Program Which Fosters Emotional Security."

American Social Hygiene Association.—In order to prevent overlapping of activities in the field of community organization for the promotion of venereal disease control, the American Society for the Control of Venereal Diseases has dissolved and amalgamated its interests with the American Social Hygiene Association, according to Dr. Russell V. Lee of Palo Alto, president of the former society.

The American Society, organized by Doctor Lee in the spring of 1937, and under the executive direction of Mr. Ray W. Smith of San Francisco, had extended its activities throughout California and other western states. The community groups and their programs developed by the Society are being taken over by the American Social Hygiene Association, which is establishing a western states division to facilitate work in this area.

Appointed to the Planning Committee of the western states division are: Dr. Ray Lyman Wilbur of Stanford University, as chairman; Dr. Thomas A. Storey, also of Stanford University; Dr. William P. Shepard, San Francisco; Dr. Lee, and Mr. Smith. Other members from other parts of California and from other western states will be added to the committee as the program is developed.

Mr. William Ford Higby will serve as director of the western states division, guiding the field service which will be offered to local community organizations. Division offices will be at 45 Second Street, San Francisco.

Greenbelt Fountain Patrons Demand Health Protection.—When the only drug store in Greenbelt, Maryland, opened for business April 21 a committee of the same consumers who coöperatively run this urban housing project had ordered, as a health and sanitary precaution,* that disposable paper cups be used in place of drinking glasses at the soda fountain to eliminate the uncertainties of dishwashing.

"This decision is popularly accepted by the consumers in what will soon become *their* consumer-coöperative drug store," said Mayor Louis Bessemer, "when control and ownership is transferred directly to store patrons." Control and ownership is held now by Consumer Distribution Corporation, a nonprofit organization that advanced $50,000 to set up and operate Greenbelt stores.

Built by the Farm Security Administration at a cost of $14,000,000 to help low-income groups in escaping high rents in Washington—which is twelve miles away—Greenbelt is expected by the end of July to be filled with the 885 families or about 3,000 persons for whom modern sanitary housing units are available.

Greenbelt claims the first drug store in the United States to be established on Rochdale coöperative principles. The central idea of "coöperation" is simply that "those who are going to use what is being sold or produced should own the store or factory and decide how the business is to be run."

Two similar "model towns"—Greenhills near Cincinnati and Greendale near Milwaukee—are said by FCA officials to be ready for occupancy, and will be operated on the same principles are Greenbelt.

The drug store is in charge of Robert Jacobsen, son of a Minneapolis druggist, who manages all the stores in Greenbelt. Gross business during the first week amounted to $831, he said, with about 60 per cent of gross business done at the fountain.

* Diseases said by health authorities to be transmissible by dirty drinking glasses include common colds, mumps, measles, tuberculosis, trench mouth and others of the upper respiratory tract, as well as syphilis.

American Congress of Physical Therapy.—The seventeenth annual scientific and clinical session of the American Congress of Physical Therapy will be held coöperatively with the twenty-second annual convention of the American Occupational Therapy Association on September 12 to 15, inclusive, at the Palmer House, Chicago. Preceding these sessions, the Congress will conduct an intensive instruction seminar in physical therapy for physicians and technicians—September 7 to 10, inclusive.

The convention proper will have numerous special program features, a variety of papers and addresses, clinical conferences, round-table talks, and extensive scientific and technical exhibits.

The instruction seminar should prove of unusual interest to everyone interested in the fundamentals and in the newer advances in physical therapy. The faculty will be comprised of experienced teachers and clinicians; every subject in the physical therapy field will be covered. Information concerning the convention and the instruction seminar may be obtained by addressing The American Congress of Physical Therapy, 30 North Michigan Avenue, Chicago.

Napa County Gets First Camp for Child Diabetics.—Striking proof of the progress that science has made in restoring chronically ill children to normal, healthy lives, is to be offered in the first camp for diabetic children in Western America, the plans for which have just been announced by the University of California Medical Center. The camp is to be held in Las Posados State Park, ten miles east of St. Helena in Napa county, July 17 to 31, inclusive.

Between twenty-five and thirty youngsters, more than half of them girls, will devote the two weeks to swimming, hiking and numerous other sports that appeal to the healthy youngster. As some of the children come from underprivileged groups and the expenses are somewhat higher than those of an ordinary juvenile camp, the University has been compelled to restrict the number of its little guests this year. All of the funds are being supplied by friends of the University, and the California Dietetics Association is coöperating with the University in supplying working personnel. General direction of the camp will be in the hands of Dr. Mary Olney of the Division of Pediatrics in the Medical Center.

This unique camp experiment has been conducted by the cities of New York and Cleveland with considerable success. Napa County was selected for the first western camp, because of its high standing as a healthful resort and recreation center and its proximity to San Francisco.

Ninth Annual Gorgas Essay Contest.—The Gorgas Memorial Institute of Tropical and Preventive Medicine, Incorporated, with executive offices at Washington, D. C., 1835 Eye Street, N. W., reports that Miss Frances Babin, a member of the 1938 graduating class of South Side High School, Memphis, Tennessee, received the Henry L. Doherty First National Prize of $500 for the best essay submitted in the Ninth Annual Gorgas Essay Contest on the subject, "The Achievements of William Crawford Gorgas and Their Relation to Our Health." Miss Babin was one of more than eighteen thousand junior and senior high school students throughout the United States who competed in this year's contest.

President Roosevelt presented the prize at the White House before a small group of distinguished guests, including Mrs. Henry L. Doherty, who with her husband contributes the prizes for the contest. Others present were Senator Kenneth McKellar and Congressman Walter Chandler of Tennessee; Dr. George Crile of Cleveland, President of the Gorgas Memorial Institute; Mrs. Franklin Martin, widow of the late Dr. Franklin Martin, who founded the Gorgas Memorial; Mrs. William D. Wrightson, daughter of General Gorgas; Major General C. R. Reynolds, Surgeon-General of the Army; Rear Admiral P. S. Rossiter, Surgeon-General of the Navy; Dr. Thomas Parran, Surgeon-General of the United States Public Health Service; Dr. J. W. Studebaker, United States Commissioner of Education; General M. W. Ireland, Dr. Leo S. Rowe, Mr. Robert V. Fleming, and Dr. Herbert C. Clark, Director of the Gorgas Memorial Laboratory in Panama.

Launched by the late Admiral Grayson, the Gorgas Essay Contest has been conducted annually under the direction of the late Admiral Cary T. Grayson, who served the Gorgas Memorial Institute for many years, first as president and later as chairman of the Board of Directors. Dr. George Crile, eminent surgeon and scientist, and director of the Cleveland Clinic Foundation, and long associated with the Gorgas Memorial as a director and officer, has taken over the leadership of the organization, in both its research and educational fields.

Doctor Crile announced winners of other national awards as follows: Second prize of $150, Miss Genevieve Rourk of Messmer High School, Milwaukee, Wisconsin; third prize of $50, Miss Catherine Quinn of St. Joseph's High School, Newport, Rhode Island; first honorable mention, Miss Marian Ridgeway of St. Mary's High School, Paterson, New Jersey; second honorable mention, Miss Luna Mask of Darling High School, Darling, Mississippi.

Following the White House presentation, Miss Babin was presented in a radio program in which Mrs. Henry L. Doherty, Dr. George Crile, and General M. W. Ireland also took part. The day's program was concluded by a luncheon given by Mr. and Mrs. Doherty to honor the young prize winner.

New Leg-Lengthening Procedure.—Science is able to record a new triumph over the after-effects of infantile paralysis and other disabling diseases while still seeking for the cause and the cure of these maladies. The efforts of science have now reached the point where one outstanding development, a new leg-lengthening procedure, is being detailed to the profession by faculty members of the University of California Medical School. The profession has been told that, properly applied and followed through, this procedure will restore a normal or nearly normal function of the leg without hazarding many of the complications encountered in the past.

The new procedure, developed by Dr. Roy C. Abbott, professor of orthopedic surgery, and Dr. John B. Saunders, chairman of the division of anatomy, shows how a leg shortened by certain types of disease may be lengthened by one-sixteenth of an inch a day without any discomfort or undue hazard to the patient. In a few instances the leg has been lengthened by one-eighth of an inch a day. In one case a gain of one and one-half inches in twenty days was noted.

In the operations conducted to date, not only have the shortened legs been lengthened to normal or nearly normal, but deformities of the knee and foot have been almost entirely overcome and no important changes which might be attributed to injured blood vessels or nerves have been noted. However, the fact that the leg may be lengthened in what may appear to be an unusually short time, is secondary to the fact that the new procedure achieves this added length and improved function without the hazard of complications that baffled science in the past.

New apparatus designed and made by August Kern, brace maker in the Medical School, plays an important part in the actual lengthening process.

When this apparatus is removed, the leg is immobilized in plaster of paris from the toes to the groin. Weight bearing with support is generally possible in from three to five months.

In the procedure special methods of treating bones and soft tissues have been devised, providing for retention of the maximum portion of the origin of the muscles which pass from the leg to the foot and permit them to travel downward. In like manner the blood vessels and nerves are freed from their points of fixation, but with their functions preserved, thus permitting relaxation of these structures during the lengthening process. The operation also maintains intact the nutrient vessels of the tibia or shin bone and the fibula or calf bone and allows minimum reflexion of the periosteum or bone covering. There is little disturbance of the blood supply to these bones.

Despite the success of their procedure thus far, Doctors Abbott and Saunders state that they are not yet ready to offer any final conclusions. The first operation of the type was performed by Doctor Abbott at the Shriners' Hospital for Crippled Children in St. Louis, and the results were so encouraging that the study was followed, with the results noted.

Press Clippings.—Some news items from the lay press, on matters related to medical practice, follow:

Two Hundred Millions Asked in War on Scourge

Tuberculosis Association Tells of Federal Funds Plan; Endorsed by United States Surgeon

Two hundred million dollars of federal funds for a final victorious drive against tuberculosis. . . .

That was the program advanced at the opening of the sessions of the National Tuberculosis Association's thirty-fourth annual meeting at the Biltmore Hotel yesterday.

The program, the approximate one thousand delegates were told, has been given the endorsement of Dr. Thomas Parran, Jr., United States Public Health Service Surgeon-General, and has won widespread support from tuberculosis experts throughout the country.

"The battle against tuberculosis is half won; a determined, well-financed campaign at this crucial time would spell final and decisive victory," declared Dr. J. A. Myers of Minneapolis, Minnesota, Association President.

Details Explained

Details of the proposed $200,000,000 eradication drive were presented by Homer Folks, Executive Secretary of the State Charities Aid Association of New York.

Starting in 1939, he said, 40,000 hospital beds would be at a cost of $140,000,000, including land, buildings, and equipment.

"This number of beds," he explained, "is approximately the number needed to provide two for tubercular patients for each annual death from the disease.

"The cost of each bed is estimated at $3,500; annual maintenance at $750 per capita would be $30,000,000."

The program additionally would call for x-raying of all persons having family contacts with tuberculosis, estimated at present to number 792,000, he said. This, at a cost of $7 each, would aggregate $5,544,000.—Los Angeles *Examiner*, June 21.

New White Plague Weapon Discovered*

Dr. Florence Barbara Seibert, University of Pennsylvania's woman scientist, receiver of the coveted Trudeau medal here last night, revealed her discovery of a tuberculin molecule of great importance for eradication of human tuberculosis, in an interview at the National Tuberculosis Association Convention.

Through the coöperation of Dr. J. Arthur Myers, President of the Association, Doctor Seibert, who is naturally shy and averse to limelight, told about her discovery in simplest fashion.

Said Doctor Seibert:

"My work has resulted in the complete separation of a substance as a molecule of known weight, that is chiefly and specifically responsible for the tuberculin reaction, our most basic method of diagnosing tubercular infection in human beings and animals.

Isolation Problem

"Tuberculin is the material which in small amount is injected into the skin of a person. If there is a reaction, such as reddening and swelling of the skin, the test is positive. That is, it shows that the germs of tuberculosis are or have been present in the person's body.

"Naturally, the more sensitive and certain this test is, the greater aid it renders in earliest diagnosis.

"The problem upon which I have been working for the past sixteen years or so, in collaboration with Dr. Edmund R. Long of the Henry Phipps Institute, University of Pennsylvania, was to isolate the particular substance or substances which give the tuberculin reaction.

"This year, with collaboration of Arne Tiselius and Kai O. Pedersen, at Dr. The Sevedberg's famous laboratory at Upsala, Sweden, I found that there are three different molecules of interest in tuberculin.

"Of these the most specific in action was one known by its molecular weight of 16,000. That is, it is so many times heavier than a molecule of hydrogen, the unit of molecular weight system.

"Now, the most interesting characteristic of this particular substance is that it does not produce antigenic or skin reaction by itself even though it has protein in it.

"Only if there is some tubercular infection in the person's body, the 16,000 molecule stirs up the skin reaction. Thus, using this ingredient of tuberculin in pure form it is possible to be sure that a positive reaction is due only to tuberculosis, no matter how mild, and not to the tuberculin protein itself.

"Tuberculin specimens thus analyzed, by use of ultra-centrifuging, electrophoresis and diffusion methods, were both of live germs (untreated, unheated) and dead tubercular germs. The molecule of 16,000 weight type was found in the live germs tuberculin."

A number of other molecules, ranging from 9,000 to 32,000 molecular weights, were found, but were less specific than the all important 16,000 weight molecule.—Los Angeles *Examiner*, June 21.

Men of Medicine*

The sixteen trustees and officers who manage the affairs of the American Medical Association sat silent for sixteen minutes and forty seconds in a San Francisco room last week. Cause: A preview of the March of Time's monthly cinema on the topic "Men of Medicine—1938," a picture of how a young man gets his medical education and interne training, how he sets up practice in a typical small United States community, how he accidentally gets and skilfully operates on his first appendix case, how he gives his service free to the poor who attend hospital clinics.

Efforts to provide good medical care for every citizen cause acrimonious rows among doctors. March of Time has the spokesmen of conflicting schools present their diverse solutions:

Surgeon General Thomas Parran saying: "The underprivileged third of our population, when seriously ill, needs help from tax funds. The health of the people is quite properly the concern of Government."

Yale's Professor of Medicine John Punnett Peters asking that the Federal Government subsidize medical schools, hospitals, research institutions, and pay the hospital and doctor bills of the poor.

Manhattan's Sociologist Kingsley Roberts explaining a movement for coöperative medicine under which individuals and families pay dues to an organization which hires doctors to look after them.

The spokesman for the majority of the American Medical Association's 110,000 doctor-members, Dr. Morris Fishbein, arguing that "Every one should have good medical service. But we insist that the practice of medicine is a doctor's problem. The doctor is the only one entitled by training, by experience, and by law to take care of the sick. Medicine is still a profession. It must never become a business or a trade, never the subservient tool of a governmental bureaucracy."

Delighted with this cinema report not only on the United States No. 1 medical controversy but on laboratory, office, sick-room and operating room procedures, the heads of the American Medical Association broke their sixteen minute and forty second silence, voted the American Medical Association's first official endorsement of a commercial moving picture: "The Board of Trustees of the American Medical Association expresses sincere appreciation of the March of Time's 'Men of Medicine—1938' as excellent educational material revealing advance of medical science and service of medical science to the sick."—*Time*, June 20.

Care of Patients

Lutgens Outlines State's Needs

Problems of providing facilities for care of mental patients, and steps toward solution of the problems, yesterday were described by Harry Lutgens, State Director of Institutions, in a report to the American Psychiatric Association.

California, said Lutgens, has 315 mental patients per 100,000 population—higher than the national average of 269 per 100,000. Influx of families from the east is contributing to an increase of eight hundred patients per year.

Yet, California, the director added, has failed to keep up with the hospital needs of its insane charges.

A 40 per cent excess—number of patients over number of mental hospital beds—is being reduced through a $12,000,000 building program using State and Federal funds. Even when this program is completed, said Lutgens, the mental institutions will be 17 per cent overpopulated.—San Francisco *Examiner*, June 10, 1938.

Charity Racket Curb Plan Given Council

Designed to curb the activities of charity racketeers and save for worthy causes the many thousands of dollars which otherwise would fall into their hands, the draft of a proposed regulatory ordinance was presented to the city council.

* See also item in Letters Department, on page 96.

The proposed measure, prepared and adopted by the Social Service Commission, was sent to the council with the request that it be enacted.

Requiring that written permission must first be obtained before solicitations for charity funds may be begun, the proposed ordinance provides that individual solicitors must show identification cards and that promoters of charity drives must obtain a license as such, good for only a year at a time.

The method of soliciting contributions in the name of charity over the telephone, commonly used by professional campaigners, would be strictly forbidden.

Permits to solicit funds for charity's sake would be granted only by the Department of Social Service.

Applications for permits would be accompanied by a $1 filing fee and full information about the organization and purpose of the solicitation. An estimated budget and financial statement of the organization would be required.

Copies of agreements between soliciting organizations and promoters would have to be submitted to the department before a permit was issued.

While individual solicitors would be required to have identification cards, this requirement might be waived where there were more than twenty-five silicitors working without pay. However, publicity about the solicitation must inform the public of the purpose of the drive.

Permits may be revoked or suspended if material misstatements have been made in the application—Los Angeles *Herald-Express*.

County Charity Budget Is Set at $32,794,416

The Board of Supervisors of Los Angeles County has fixed the preliminary budget for the county Department of Charities, exclusive of institutions, at $32,794,416 for the fiscal year 1938-1939, an increase of $6,354,339 over the 1937-1938 budget of $26,440,077.

The preliminary budget is to be considered at public hearings, after which it may again be revised by the supervisors.

Of the new budget, however, only $12,735,228 will be raised by taxation as compared with $13,081,945 this year. This is because of State contributions and refunds in aid to the aged, indigent children and blind. The Legislature at its recent special session appropriated $6,000,000 in addition to regular contributions for the various counties, and of this amount Los Angeles County will receive $2,013,283.

Other Requests

The supervisors have not yet taken up the requests of Rex Thomson, superintendent of charities, for the county institutions such as the General Hospital, Olive View Sanatorium and the county farm. These requests total $9,050,000.

The county will also receive state and federal aid for the institutions but the amounts have not yet been broken down.

The allowances for the department as fixed today, exclusive of the institutions, and the allowances last year are as follows:

	1938-39	1937-38
Aged aid	$20,532,000	$15,850,000
Direct relief	4,883,000	4,531,604
Bureau of indigent relief	2,232,660	1,886,097
Child aid	2,177,950	1,605,688
Blind aid	1,695,242	1,406,620
Administration	1,273,564	1,160,068
Totals	$32,794,416	$26,440,077

Hospital Plan Declared Legal

Opinion Given on Leasing Proposal for Olive View

A proposal of private parties to construct a 940-bed hospital on the grounds of Olive View Sanatorium and to accept rentals from the county financed by State tuberculosis subsidies, is legal, according to an opinion on file with the supervisors.

County Counsel O'Connor said the fact that the buildings would be leased and not owned by the county will not jeopardize State subsidies.

Rentals would be paid by the county at an average cost of $8,227.50 per month for three hundred months, and would total $2,468,250 over twenty-five years, if the plan is approved.

Superintendent of Charities Thomson estimates that the county would receive about $130,000 additional in State subsidies if the new facilities are provided.

Reduction in gross cost per patient per day from $3.67 in 1930-31 to $2.75 last fiscal year, and an increase of 248 patients in three years for a total of 1,731, were shown in the annual report of Olive View Sanatorium just released.

LETTERS

Concerning film narrative, "Men of Medicine: 1938."*

To the Editor:—At the opening session of the American Medical Association convention in San Francisco on June 12, the delegates will attend a preview of "Men of Medicine: 1938," a twenty-minute March of Time film narrative on medical science's immeasurable contribution to American life. Immediately thereafter it will be released to 11,374 theaters throughout the world, and will be seen by an estimated United States audience of 24,000,000 people.

This is the first authentic motion picture for theatrical distribution produced with the unrestricted coöperation of the American Medical Association, the United States Public Health Service, and the medical departments of the United States Army and Navy. Already those doctors who have seen the picture in our projection room have been unanimous in their praise and approval not only of the picture's accuracy but of its potential value in bringing essential medical knowledge to the public.

No film before has told the story of the sixty-nine great medical schools of the United States, the ten years of training which each doctor must undergo at a cost of nearly $15,000, the fact that United States doctors, in a time of depression, are today contributing $1,000,000 daily in free clinical services for the poor and distressed.

Coming at a time when actually 40,000 or more American doctors earn less than $2,000 annually, when new plans for coöperative medicine, group hospitalization, health and old-age insurance and government aid are discussed on every hand, this important record of the practice of medicine, ranging from the duties of the small-town country doctor to great laboratories of internationally known institutions, constitutes not only an important document of medical progress but an informative and educational record which every layman should see.

I truly hope that unless you are present at the San Francisco preview, you yourself will see it in your local theater and will feel as we do that it is a document of such value that every effort should be made to assure the widest possible public audience. We would be happy indeed to coöperate in any plans which you could suggest in your own field of activity, and hope that we shall hear from you in this important matter.

Sincerely yours,

Louis de Rochemont,
Producer and Publisher.

Concerning educational leaflet on syphilis.

(COPY)

Treasury Department
U. S. Public Health Service
Washington

To the Editor:—Foremost among the problems which face the physician in his treatment of syphilis is that of keeping the patient in treatment. When skin lesions disappear and the patient "feels fine" he is apt to disregard the doctor's advice and lapse.

The first line of defense against such lapses is education. When the patient thoroughly understands his disease—as the diabetic is taught the idiosyncrasies of his diet—he may be more often counted upon to continue through that long course of seventy injections recommended by the Coöperative Clinical Group.

The little folder which we enclose was prepared with the physician's problem in mind.

It is clear. We tried it on patients at a city clinic, on a workers' education group, on a grade-school age group, on college students. We revised it until it answered their questions in a way they would understand. Then we added the pictures to help drive home the story.

It is inexpensive. It may be secured from the Superintendent of Documents in Washington, D. C., for $1 per 100 copies. In smaller quantities, five cents each. But give

one to each patient on the occasion of his first visit, and it should save many cases for many treatments. In replying, address the Surgeon-General, U. S. Public Health Service.

Sincerely yours,

R. A. Vonderlehr,
Assistant Surgeon General,
Division of Venereal Diseases.

Concerning new edition of "New and Nonofficial Remedies."

(COPY)

American Medical Association
Council on Pharmacy and Chemistry

Chicago, June 6, 1938.

To the Editor:—We are forwarding a copy of "New and Nonofficial Remedies," 1938, and a copy of the "Annual Reports of the Council on Pharmacy and Chemistry," 1937, with the compliments of the Council. We trust that these books will be of help to you in your editorial work.

A review of the new edition of "New and Nonofficial Remedies" and of the Council reports in your journal will be appreciated.*

Yours sincerely,

Paul Nicholas Leech,
Secretary, Council on Pharmacy and Chemistry.

Concerning proposed State Humane Pound Law.

OFFICE OF
Director of Public Health
City and County of San Francisco

(COPY)

San Francisco, June 16, 1938.

To the Editor:—For your information I am enclosing copies of correspondence which is self-explanatory. This is sent for your information.

Sincerely,

J. C. Geiger, M.D., *Director.*

* * *

OFFICE OF
Director of Public Health
City and County of San Francisco

(COPY)

June 15, 1938.

Mr. V. Collins, Secretary,
General Volunteer Campaign Committee,
For State Humane Pound Act,
406 Sutter Street, San Francisco.

My Dear Mr. Collins:

I am very much interested in your letter of June 11, addressed to the members of the Woman's Auxiliary to the American Medical Association, in convention now assembled in San Francisco.

Any letter or expression purporting that I am opposed to the use of impounded dogs is a curiosity, indeed, to me. I recall very distinctly several years ago of having made a recommendation at the time a new pound ordinance was under consideration before the Board of Supervisors of the City and County of San Francisco to allocate a number of the animals collected by the pound to the universities for experimental purposes. This recommendation subjected me to extraordinary criticism and threats, and the resultant hearings before the Board of Supervisors were near-riots.

I have gone through our correspondence that occurred at that time with Mr. A. J. Gallagher, a Supervisor of the City and County of San Francisco, who handled the pound ordinance. I am attaching a copy of my letter of August 31, 1932, which was in answer to an attempt by someone to include in this ordinance a section granting the power of inspection of various laboratories to certain individuals connected with the pound. I think this letter, especially the third paragraph on page two, will definitely indicate to you my feelings accordingly and why my original request for allocation of these animals to research institutions was withdrawn.

In conclusion, I hope in the future you will quote me or the circumstances correctly. Furthermore, I desire to point out that the so-called humane pound law, if passed, would be a detriment to the public health, to scientific medicine and to the control of disease, whether in humans or animals.

Sincerely,

J. C. Geiger, M.D., *Director.*

(COPY)

August 31, 1932.

Mr. Andrew J. Gallagher,
Supervisor, City Hall,
San Francisco, California.

My dear Mr. Gallagher:

With reference to our conversation at the Board of Supervisors as to Article 10 on the calendar of the Board for the meetings of August 29, when there was some discussion as to Section 27 of an ordinance providing a public pound, it is my distinct understanding that you requested an opinion from me as an individual as well as the Director of Public Health accordingly. A previously arranged trip with the Public Utilities Commission to Hetch Hetchy, however, will preclude my being present when called again. Likewise, because of the gratuitous insults directed toward me at a previous meeting on animal experimentation perhaps it is just as well that I cannot be present, therefore my opinion is given in writing.

There are two universities and one research institution that may be involved in animal experimentation for scientific purposes in San Francisco, namely, the Medical School of the University of California, Stanford University School of Medicine, and the Hooper Foundation for Medical Reseach of the University of California.

It is the writer's opinion that to pass Section 27 would grant or serve as an excuse, to many persons, either officially or otherwise, to act as inspectors and annoy legitimate research workers by requesting, and perhaps demanding, search for certain dogs or insisting that the dogs are in the institutions. Moreover, I consider this section entirely antimedical and, as an individual and as the Department of Public Health, we vehemently protest it. Furthermore, if anything antimedical inimical to animal experimentation upon which much of our modern public health depends comes from a committee officially dedicated to health it would appear to be a travesty on health.

May I point out to you that animal experimentation as a means of promoting human and animal welfare has recently received the sanction of two tribunals of great importance, one in the United States and the other in England. Both decisions tend to brighten the outlook for the protection of medical science against the perpetual warfare that threatens it through bequests for the support in perpetuity of organizations opposed to experiments on animals.

In the American case (Pennsylvania Company for Insurance on Lives and Granting of Annuities, executor of the estate of A. Sidney Logan, deceased, petitioner vs. Commissioner of Internal Revenue, respondent, 25 B. T. A.) the United States Board of Tax Appeals held that a bequest to a society organized for the "total abolition of all vivisection experiments on animals and other experiments of a painful nature" was not a bequest to a corporation organized and operated exclusively for the prevention of cruelty to animals, and that, therefore, the amount of such a bequest could not be deducted from the principal of an estate in computing the federal estate tax. The decision of the Court of Appeal in the English case (*In re Grove-Grady; In re Plowden* vs. *Lawrence,* 98 L. J., Chr. 261 (1920) 1 Ch. 557, the Law Journal, 71:329 (May 9), 1931, raised the question whether, "in the light of later knowledge in regard to the benefits accruing to mankind for vivisection," bequests designed to hinder and prevent vivi-

* Book reviews appear in this issue in front advertising section, as noted in front cover index, under Miscellany.

section would today be regarded as charitable bequests. On appeal, the House of Lords forbade the use for antivivisection propaganda of any part of the legacy concerning which the question was raised. The English decision is of only persuasive influence in the United States, but the changing view suggested by it was with respect to bequests to create trusts to carry on activities against animal experimentation if of vital importance. Unless such trusts can be shown to be charitable in character, they cannot be made to operate in perpetuity.

The decision of the United States Board of Tax Appeals is available. It is a remarkable statement of the value of experimentation, all the more cogent because of the dispassionate, nonmedical, judicial source from which it emanated. The executor of the estate against whom the decision was rendered may appeal to the courts for relief, but a decision by an appellate court would almost certainly do nothing more than strengthen the defense of animal experimentation that the decision affords.

*These cases should be read by all members of your committee, and it is not beyond the writer's belief to assume that the members have not read the communications to the committee from one hundred and fifty leading scientists for animal experimentation. Certainly, the weight of the evidence proves that animal experimentation is of benefit to mankind—to animals, too, for that matter. If animal experimentation is for the benefit of mankind and of animals, bequests to hinder or prevent such experimentation obviously cannot be for the benefit of mankind, and bequests to accomplish that end cannot be charitable bequests. It may be argued that such reasoning is begging the question; that it assumes that the benefits that have been and are being derived from animal experimentation are at best not sufficient to offset the alleged cruelty to such experimentation. The answer is that there is no cruelty associated with animal experimentation that is not within the research of the ordinary laws for the prevention of cruelty to animals. The fact that prosecutions are cruelty in connection with animal experimentation are practically unheard of, despite the vigilance of antivivisectionists, is evidence of the absence of such cruelty. The trouble with the antivivisectionists' reasoning lies in the fact that they fail to distinguish between pain and cruelty and set up their own standards of cruelty, which are not the standards of the law nor the standards of the community.

Probably these two legal decisions represent the general trend of mature and cultured thought on the subject of animal experimentation, when uninfluenced by lurid appeals to the imagination and by appeals to self-interest. Both decisions were based on the orderly presentation of legal evidence, not on such clamorous, virulent, emotional speechmaking as commonly fill the air when animal experimentation is discussed before legislative committees. If such committees would limit the presentation of evidence in the same way that it is limited by the courts, their decisions could be relied on to be as sound as the recent decisions of the United States Board of Tax Appeals and the English House of Lords and Court of Appeals. Doubtless, however, in the United States, at least, the political aspects of hearings before legislative committees and the absence of well-defined rules of evidence and procedure will continue too often to render orderly judgment impossible.

Finally, in protesting, may I point out to you and to your committee that, in my original recommendation to the ordinance, several hundred of the many thousand dogs poisoned in the pound each year could be allocated for scientific medical research without offense to the intelligent individuals, it was withdrawn because competent legal advice plainly indicated that neither the Board of Supervisors nor the Department of Public Health had any right in the premises of the Public Pound, as it is a quasi-public institution to which funds are allocated but under a private board privately controlled.

I hope the committee will give due consideration to this protest and, therefore, strike out Section 27 from this ordinance.

Sincerely,

J. C. Geiger, M.D., *Director*,

* This is the paragraph previously referred to.

Concerning a "syndicated article" on rabies.

County of Los Angeles
Department of Public Health

Los Angeles, June 7, 1938.

To the Editor:—I am also attaching a copy of letter I wrote to the editor of the *Times* regarding an article by Doctor Brady on rabies which appeared in that paper, and reply of the editor. I thought you would be interested in this, as the subject of rabies seems to be a special "pet" of Doctor Brady's.

Very truly yours,

J. L. Pomeroy, M. D.,
Los Angeles County Health Officer.

* * *

(copy)

May 31, 1938.

The Editor,
Los Angeles Times,
First and Spring Streets,
Los Angeles, California.
Dear Sir:

My attention has been called to one of the syndicated articles of Dr. William Brady in one of your columns on April 28, 1938, concerning rabies.

I desire most emphatically to protest the statements of this article, particularly Doctor Brady's direct statement that the Health Department works up a rabies scare to gain publicity for the Department and the insinuation that this publicity is to obtain larger appropriations, etc. As a matter of fact, appropriations made to public health are not based on the number of articles published in any newspaper concerning this disease or any other disease. If this were true we would have all the money we could possibly spend in fighting venereal diseases and tuberculosis which are and have been thoroughly publicized for a considerable length of time. On the contrary, the rabies situation has actually diverted a considerable sum of money from other functions in the Department where it is badly needed, and because of the controversial nature of the work we would be very happy to see rabies disappear from this county. It is a severe liability instead of an asset to the Department. Furthermore, it is a severe liability to the county as a whole because of the unfavorable criticism from cities such as San Francisco, where rabies is practically unknown. Articles such as Doctor Brady's, further, are a total liability so far as the reputation of this county is concerned.

The further statement in this article that Pasteur virus causes some of the grave effects health authorities and some doctors describe in man and that Doctor Brady recommends antitetanus serum in lieu of Pasteur treatment would be ridiculous if it were not for the fact that many people will be misguided and endanger their lives by such treatment. We strongly urge people to ignore such advice. We most strongly insist that every dog bite by an animal suspected of having rabies should be cauterized by a reputable physician, or by a doctor in our Health Centers, with fuming nitric acid, the only substance recognized at the present as being destructive of the rabies virus. Further, the patient should take the Pasteur treatment if it is proved that the dog has rabies.

During the past seventeen months there have occurred in this county, including Los Angeles City, 2,306 cases of positive rabies, including all animals. If these animals suffer from tetanus, as Doctor Brady implies, it is remarkable that no authority of any standing, state, city, or county, has made such a finding. It is remarkable, too, that the many hundreds of human beings who have been treated with the Pasteur treatment all escaped, with but two exceptions, developing the disease. In several instances, valuable lower animals were also saved by the Pasteur treatment. Not a single case of tetanus occurred!

Articles such as contributed by Dr. William Brady on a matter fraught with grave danger to human life should represent established, scientific medical opinion and not armchair speculation. The public is at least entitled to representative medical opinion.

Very truly yours,

J. L. Pomeroy, M. D.,
Los Angeles County Health Officer.

Los Angeles Times

June 3, 1938.

Dr. J. L. Pomeroy,
Health Officer,
Los Angeles, California.

Dear Doctor Pomeroy:

This will acknowledge receipt of your letter taking exception to the remarks of Doctor Brady in his column of April 28, 1938.

As you know, Doctor Brady's column is a syndicated feature and the opinions expressed therein are Doctor Brady's and not necessarily those of the *Times*.

I shall be glad to forward your letter to Doctor Brady.

Very truly yours,
The Los Angeles Times.
L. D. Hotchkiss, *Managing Editor.*

MEDICAL JURISPRUDENCE †

By Hartley F. Peart, Esq.
San Francisco

Malpractice: Proof of Negligence of a Physician and Surgeon by Testimony Other Than Expert Testimony

The general rule with respect to proof of negligence against a physician and surgeon is that the acts and conduct which may constitute negligence on the part of a physician or surgeon in the performance of a professional service are matters so peculiarly within the knowledge of physicians and surgeons and so far beyond the knowledge of the average man that proof of negligent acts and conduct can only be made by physicians and surgeons. Such testimony of physicians and surgeons is called expert testimony and the evidence which they adduce concerning the propriety of the defendant's acts and conduct is called "opinion evidence."

In rare instances courts have held, under the facts of a particular case, that the act or omission of a physician and surgeon or other professional person was so obviously negligent that the matter could reasonably be said to be within the knowledge of the average man and that as a consequence expert testimony was not necessary. A recent California case relies upon this exception to the general rule requiring proof of negligence against a physician and surgeon to be by means of expert testimony only. In *Thomsen* vs. *Burgeson*, 93 Cal. App. Dec. 394, decided May 4, 1938, the alleged facts were as follows:

Defendant performed a tonsillectomy upon plaintiff who, at the time, was two years and eight months of age and removed the uvula and a portion of the soft palate and injured the anterior and posterior pillars of the plaintiff's throat. Plaintiff's complaint alleged negligence in the removal of the uvula and a portion of the soft palate and in the injury to the anterior and posterior pillars of the throat, and, in addition, alleged that a trespass had been committed in that defendant "without the consent of plaintiff or his parents, removed said uvula and portion of the soft palate."

At the trial the plaintiff did not produce any expert testimony in support of the allegations of his complaint. Defendant thereupon contended that there was nothing to go before the jury, because, in the absence of expert testimony concerning the propriety of the defendant's act, the jury had no standard by which it could judge defendant's conduct.

The Court, however, held as follows:

Without going into further detail, it is sufficient to state that the evidence reveals a situation which clearly takes the case at bar out of that class of cases in connection with which expert testimony is indispensable. . . . The rule has been declared as follows: "It is equally true that cases which depend upon knowledge of the scientific effects of medicine, or the result of surgery, must ordinarily be established by expert testimony of physicians and surgeons. This rule, however, applies only to such facts as are peculiarly within the knowledge of such professional experts and not to facts which may be ascertained by the ordinary use of the senses of a nonexpert." So far as an understanding of the operation involved herein is concerned, it would appear to be a matter of common knowledge that the removal of a portion of the soft palate and of the uvula is no part of a tonsillectomy. The location of the tonsils is a matter which is easily observable to anyone, and the location and functions of the uvula and soft palate are matters of common knowledge, and of which the courts can take judicial notice. Therefore, there was evidence in the record, at the time the motion for a directed verdict was granted, sufficient to support a verdict for plaintiff had such verdict been returned.

There can be no quarrel with the rule of law which allows an exception to the general rule requiring proof of negligence against a physician and surgeon to be by means of expert testimony and by no other, in those instances where the alleged negligent act or omission is obviously negligent or may clearly be said to be of a wilful nature. Examples of cases in which expert testimony has been said to be unnecessary are: Where a dentist leaves a decayed tooth in the jaw of his patient and removes one which is sound and serviceable, and where a surgeon undertakes to stitch a wound on the patient's scalp and while doing so thrusts his needle into the patient's eye.

However, conceding the rule to be a sound one, the question arises, should it have been applied under the facts of the case under discussion? It may well be disputed that the alleged acts of the defendant in *Thomsen* vs. *Burgeson* were such that it could be said to be "a matter of common knowledge" that they would not have occurred if due care had been used. Is it true that "the location of the tonsils is a matter which is easily observable to anyone"? It would seem to be fairly clear that the tonsils cannot be located "easily" by anyone. It would also seem to be clear that the "location and functions of the uvula and soft palate" are not matters of common knowledge. Therefore, it is believed that the District Court of Appeal erred in applying to the facts before it the rule dispensing with the requirement of expert testimony. After all, if the alleged negligence was as clear-cut as the Court believed, there would be no difficulty in proving that fact.

† Editor's Note.—This department of California and Western Medicine, presenting copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

SPECIAL ARTICLES

CALIFORNIA MEDICAL ASSOCIATION

Sixty-Seventh Annual Session, Pasadena* May 9–12, 1938

California Medical Association Opens Four-Day Session

Speakers Tell Change in Public Attitude

Maintaining that "the one outstanding achievement of the twentieth century, so far as medicine is concerned, is the change in attitude toward venereal diseases on the part of the laity and the medical profession," Dr. Morrow of San Francisco, President of the California Medical Association, opened the organization's sixty-seventh annual convention here today.

Expect Two Thousand Delegates

Eight hundred delegates were registered this afternoon, the number being swelled rapidly as newcomers arrived at the Hotel Huntington, convention headquarters. It is expected that two thousand will be in attendance by the time the conclave ends on Thursday.

Dr. George H. Kress, President of the Los Angeles County Medical Association, gave a short address of welcome to the delegates, and Dr. F. C. Warnshuis, Secretary of the State Association, announced convention highlights.

The president's dinner is scheduled to take place tomorrow night at the Hotel Huntington, and President-Elect Dr. William W. Roblee of Riverside will take office on Wednesday.

Scientific section meetings were held this afternoon, with more such sessions scattered throughout the convention.

The entire patio of the hotel has been turned into a regular "circus" tent, with more than fifty elaborate exhibits being kept open day and night.

Doctor Morrow's address, a review of the medical world's stand in the fight against venereal diseases, was the feature of the morning session. . . . —Pasadena *Star-News*, May 9.

* Paragraphs here printed have been taken from press reports.

Wives Visit Film Studios as Doctors Open Sessions

Convention of Woman's Auxiliary Will Get Under Way at Vista Tomorrow

Forming an advance guard for the delegation to the ninth annual convention of the Woman's Auxiliary to the California Medical Association, two hundred doctors' wives registered at the Hotel Huntington today.

A pre-convention board meeting, held in the Crystal Room, was presided over by the State president, Mrs. Hobart Rogers of Oakland, and after that the feminine contingent attended the general session of the sixty-seventh annual State Medical Association convention in the ballroom.

An informal luncheon, and then almost the entire delegation of women were off in busses for the motion picture studios of Hollywood, expecting to be back tonight to dine with their husbands, and to hold a reception and musicale at nine o'clock in the hotel for the wife of Dr. Howard Morrow, outgoing State Association president.

The Woman's Auxiliary will really get into action tomorrow morning at 9:30 o'clock at the Hotel Vista del Arroyo, when it conducts its first general meeting, with Mrs. Rogers presiding.

Luncheon at the Vista will follow the meeting, and tomorrow afternoon there will be sight-seeing trips. The women, of course, will attend the president's dinner and dance the Huntington tomorrow night. They will wind up their convention on Wednesday, with a post-convention state board meeting in the afternoon.

The Credentials and Registration committees worked fast and furiously this morning on the mezzanine floor at the Huntington. Mrs. Charles C. Hall, Chairman, was assisted by the local chairman, Mrs. Mark Albert Glaser.

Mrs. Arthur T. Newcomb of Pasadena, General Chairman, is being assisted by many other local doctors' wives on the various committees.

Charming young hostesses making themselves generally useful at the convention are daughters of Auxiliary members, and include a number of Pasadena girls.

The incoming State president, Mrs. Clifford Andrews Wright, will be honored at luncheon on Wednesday at the Vista, and the past State presidents also will be guests of honor.

Members of the State Advisory Board will be honored at a luncheon at the Vista tomorrow, when presentation of the Doane membership trophy will be made by Mrs. William Henry Sargent of Oakland.

Dr. Lowell S. Goin of Los Angeles, will speak at the luncheon on "Crux Medicorum." — Pasadena *Star-News*, May 9.

AMERICAN MEDICAL ASSOCIATION

Eighty-Ninth Annual Session, San Francisco* June 14–17, 1938

Medical Leaders Here, Map Study of Physical, Social Ills

Vanguard of Doctors Arrives in San Francisco

America's men of medicine, in whose skilled hands is held the health of the nation, yesterday converged upon San Francisco to focus their combined attention on both scientific and social problems.

A few minutes after he arrived at the Sir Francis Drake Hotel, Dr. Morris Fishbein, editor of the Journal of the American Medical Association, said that the Association will participate July 18, 19, and 20 in the Washington conference on a national health program.

He added the announcement that the American Medical Association has invited Josephine Roche, under whose leadership the Washington conference will take place, to address the convention here Tuesday afternoon. Miss Roche, former Assistant Secretary of the Treasury, in charge of public health, accepted the invitation and will either appear personally or send a representative to speak for her.

"Miss Roche has been asked to explain her program for national health service distribution, a program she is working out from a social security point of view," Doctor Fishbein said.

Sees Agreement

A vast majority of the nation's doctors oppose any form of "social medicine," which would interpose a federal bureaucracy between physician and patient. The medical men recognize as an economic problem the distribution of their services. Doctor Fishbein's announcement of Miss Roche's appearance immediately focused convention attention on the profession's great issue of "tax paid" medicine.

Doctor Fishbein indicated his belief that "a rapprochement is in sight" between the profession and the Government.

Leaders Arrive

Scientifically, said the veteran spokesman for the American Medical Association, the convention will bring forward for discussion more than 350 reports, representing the advance of a year in medicine. And a great exhibit in the Civic Center will present 150 doctors demonstrating the techniques and facilities of the modern science of healing.

"This national convention will be a demonstration that medicine never stands still, always advances," said Doctor Fishbein. "We can see in the future, for example, the complete eradication of some of the deadly diseases."

Ready to work, to renew friendships, and to see San Francisco, the leaders of the American Medical Association arrived yesterday, preceding the host of 7,000 doctors who will participate in the convention, opening formally on Monday.

In the vanguard were: Dr. J. H. Upham of Columbus, Ohio, president of the Association; Dr. Irvin Abell of Louisville, Kentucky, president-elect; Dr. Olin West, secretary; Dr. A. W. Booth of Elmira, New York, president of the board of trustees; Dr. C. B. Wright of Minneapolis, trustee; Dr. H. H. Shoulders of Nashville, Tennessee, vice-speaker of the House of Delegates; and a score of other distinguished men.

Many were accompanied by their families. With Doctor Fishbein were Mrs. Fishbein; their daughter, Marjorie; and son, Justin.

A western welcome ushered in the American Medical Association. At Ogden the Southern Pacific's "Forty-niner" was boarded by Oakland doctors, with an orchestra and entertainment. At Berkeley, Dr. Frederick C. Warnshuis of San Francisco, for the California Medical Association, welcomed the arrivals. The doctors were driven to their Sir Francis Drake Hotel headquarters, then returned to the East Bay.

They visited Diablo Country Club and were entertained at the Claremont Country Club last night by the Alameda Medical Society.

San Francisco already was the world's medical center when the American Medical Association leaders arrived. The American Psychiatric Association was completing its week of work at the Fairmont Hotel. Across the street, at the Mark Hopkins, the American Ophthalmological Society was conducting its seventy-fourth annual convention.

Other Sessions

The American Heart Association was in session at the Sir Francis Drake. With their microscopes, 150 men and women were at the Palace Hotel for the meeting of the American Society of Clinical Pathologists. The Association for the Study of Allergy met at the Empire Hotel.

And at Del Monte the American Academy of Pediatrics and the American Dermatological Association convened. Other medical groups will meet simultaneously with the American Medical Association in San Francisco next week.— San Francisco *Examiner*, June 11.

Five Thousand Physicians Throng San Francisco for Medical Meeting

Convention Opening Tomorrow to Review Progress of Medicine During Past Year

As one doctor to another, leading medicos of the nation tomorrow will open discussions on humanity's ills and the progress medicine has made the past year in making a happier and healthier life for mankind.

Sessions of the American Medical Association's eighty-ninth annual convention continue through Friday with approximately five thousand members in attendance. Their discussions, scientific and technical exhibits focus the attention of the medical world on San Francisco.

Three major types of activity are included in the program arranged at a preconvention meeting of Association officers yesterday. These include scientific and technical exhibits, scientific meetings in which hundreds of papers describing the year's advances in medicine will be heard and sessions of the House of Delegates, in which are determined the policies of organized medicine.

Scientific Exhibits

Scientific and technical exhibits will be set forth in the Civic Auditorium; scientific meetings will be held in adjacent buildings in the Civic Center and the House of Delegates meeting in the Sir Francis Drake Hotel.

The scientific exhibit consists of more than 150 displays prepared by leading investigators to demonstrate the prog-

* Paragraphs here printed have been taken from press reports.

ress of medicine since the Atlantic City meeting last year. They give a comprehensive picture of the advances in medicine, including a way to keep human marrow alive outside the body so scientists can study the action on it of such drugs as sulfanilamid; reports on the new treatments of mental disease by insulin and metrazol shock; a new design for an oxygen tent that is easily portable; and a report on the value of a nasal spray for protection against infantile paralysis.

Meetings Slated

The House of Delegates, made up of about 175 delegates, elected by state and territorial medical associations, will hold meetings tomorrow, Tuesday, and Thursday. General scientific meetings are scheduled during the first two days of the convention.

Highlighting tomorrow's program will be an address by Dr. Anton J. Carlson, professor of physiology, University of Chicago, on "Animal Experimentation in Medicine." Specialists are to discuss other subjects, including the fever treatment of syphilis, wounds of the heart, brain tumors, mental hygiene, eczema, Bright's disease, and hemorrhage of the stomach.

The one general meeting of the convention is scheduled for Tuesday night in the Opera House, where Mayor Rossi, city and state medical leaders will welcome the visiting physicians to San Francisco. Dr. Irvin Abell, Louisville, Kentucky, will be inducted into the presidency on the occasion, succeeding Dr. John H. P. Upham, Columbus, Ohio, the retiring president.

Other Conventions

Other national medical associations are holding meetings in San Francisco this week. They include: the American Academy of Tuberculosis, Friday and Saturday; the American Medical Women's Association, Sunday, Monday, and Tuesday; the American Radium Society, tomorrow and Tuesday; the American Rheumatism Association, tomorrow; the Association for the Study of Internal Secretions, tomorrow and Tuesday.

In conjunction with the American Medical Association convention, the Woman's Auxiliary to the Association will hold its sixteenth annual convention. Registration opens today, with Mrs. Harry O. Hund as chairman. Mrs. Augustus S. Kech, National President, is to preside at a preconvention meeting tomorrow in the Fairmont Hotel.—San Francisco *Chronicle*, June 12.

* * *

Seven Thousand Mercy Men Here for Medical Meet

Eyes of the medical world focus on San Francisco today as seven thousand of the country's leading physicians open the eighty-ninth annual convention of the American Medical Association.

Concerned with advances in scientific medicine, the doctors will meet for five days to exchange medical research findings and consider the conclusions of members of their profession in diagnosis and treatment.

Activities of the attending physicians will be centered in the reading of more than 300 reports, examination of scientific and associated exhibits and drawing up of organized medicine's policies.

Registration of members starts at 8:30 a. m. in the Civic Auditorium and will continue through the convention.

The House of Delegates, made up of 175 delegates elected by state and territorial medical associations, will hold its first meeting at 10 o'clock in the Sir Francis Drake Hotel.

The 150 scientific exhibits will be opened at noon on the first and second floors of the Civic Auditorium. Sponsors of the exhibits will explain their developments.

Science Sessions

In the Memorial Opera House, scientific meetings will be held during the afternoon. Included in the discussions will be animal experimentation in medicine, antepartum care, ophthalmoscopic signs of constitutional disease, mental hygiene as related to the psychoneuroses, and the relation of photography to medicine.

At the opening meeting of the House of Delegates today reports of the officers will be made. New business will be introduced in the form of resolutions from the floor, and the winner of the special award for achievement in the art and science of medicine will be selected by the group. The session will end at noon.

Reference Reports

The House of Delegates will meet again tomorrow morning, when reference committees will bring in their reports.

There will be an executive session of the House Tuesday afternoon. Final meeting of the House will be held Thursday afternoon, when officers will be elected and next year's meeting place selected.

The seven California delegates to the House are Dr. Elbridge J. Best, San Francisco; Dr. Charles A. Dukes, Oakland; Dr. Robert A. Peers, Colfax; Dr. Lyell C. Kinney, San Diego; Dr. Edward M. Pallette, Dr. William R. Molony, Sr., and J. P. Nuttall, Santa Monica.

The vital question of socialized medicine may be discussed at the general meeting of the convention tomorrow evening at eight o'clock in the Memorial Opera House, it was indicated. At that time Dr. Irvin Abell of Louisville, Kentucky, President, will touch on a tax-paid medical system.

At the executive session of the House tomorrow afternoon, Dr. Warren Draper, Assistant United States Surgeon-General and Public Health Association delegate to the convention, will present the Government's views on the controversial subject, it was announced.

Held State Problem

As to any discussion of the medical care of California's migratory workers, Dr. Olin West, secretary and general manager of the Association, indicated there was none planned. "That is a state problem," Doctor West said.

The convention may also hear a report from the "Committee of 430," a group within the membership which last November advocated the use of public funds to finance preventive medicine, for medical treatment of the indigent, and for medical research, voluntary hospitals, research and consultative service.

When the report of the Committee of 430 was first published it was regarded in some quarters as a revolt against the Association which last year sidetracked a proposal from the New York Medical Society advocating national indorsement of similar theories.

Awards Wednesday

Awards of gold, silver, and bronze medals will be made Wednesday afternoon for the best scientific exhibits.

Other national medical associations holding meetings today and Tuesday include: The American Medical Women's Association, the American Radium Society, the American Rheumatism Association, and the Association for the Study of Internal Secretions.

The Woman's Auxiliary to the American Medical Association is holding its sixteenth annual convention in conjunction with that of the Association. Mrs. Augustus S. Kech, National President, will preside at a preconvention meeting today in the Fairmont Hotel. Registration opened yesterday.—San Francisco *Chronicle*, June 13.

Doctors Open Fight Here on State Control

Regimentation of Healing Profession by Government Scored in American Medical Association Session

The American Medical Association, meeting here in its eighty-ninth annual convention, yesterday lost no time in coming to grips with its major present problem—the threat of state socialized "tax paid" medicine.

Regimentation of the healing profession under paternalistic governmental auspices was hit, and hit hard, in speech, report, and resolution at the very first session of the House of Delegates, supreme governing body of the Association, meeting at the Hotel Sir Francis Drake.

Incoming and outgoing presidents of the Association challenged all attempts to wrest from the profession control over its own services, the Association's Board of Trustees hit "recent agitation for socialization of medicine by some grandiose scheme."

Resistance Told

The profession "resists efforts and proposals that would include and regiment its service under lay control," declared Dr. Irvin Abell, incoming president.

There is a "manifest determination to preserve the individual type of medical practice as that best suited to this country and to maintain that practice on the highest possible plane," declared Dr. J. H. J. Upham, retiring president.

Yet, underlying the Association's unyielding opposition to surrendering the care of the nation's sick to bureaucratic administration was keen recognition of the profession's obligation to share in the economic adjustments of the nation.

The profession has an "aroused consciousness" of the part it should play in solving "the present economic problems in relation to illness," said Doctor Upham.

"Fully Cognizant"

"The medical profession is fully cognizant of the social and economic needs that lie so heavily on the indigent and low-income groups," said Doctor Abell, pledging the profession to its share in their rehabilitation.

Both officers and the board of trustees pointed to the Association's current nation-wide survey of medical needs, and predicted that when completed it will point the logical way to solution of many grave medical problems.

The Federal Government's case for some degree of medical socialization will be laid before the delegates at what is expected to be a spectacular executive session this after-

noon. The Government's representative will be Dr. Warren Draper, Assistant Surgeon-General of the United States Public Health Service.

Tenor of Message

"If you oppose state socialization of medicine, what do you propose as its alternative to provide adequate medical care for those groups of the population which are not now receiving it?" is expected to be the tenor of Doctor Draper's message of the Association.

The delegates did not concern themselves exclusively with vital matters of policy yesterday. They took time out to select for a newly created honor, the distinguished service medal of the American Medical Association, Dr. Rudolph Matas of New Orleans.

With reports of committees and speeches of officers out of the way, the delegates exercised their democratic prerogative of introducing resolutions affecting conduct of the Association's affairs and on matters affecting medical practice.

Notable among them was a resolution submitted by Michigan delegates providing for creation of a council on public relations and employment of qualified public relations counsel to represent organized medicine before the public.

Move to Supplant

The resolution was interpreted in some quarters as an effort to supplant Dr. Morris Fishbein, editor of the Association's journal, as medicine's spokesman.

Another resolution, submitted by Dr. William R. Molony of Los Angeles, a California delegate, appeared aimed at the influx of foreign physicians into the United States, fleeing from autocratic persecution. The resolution called on state medical societies to require full citizenship—which involves a five-year wait for aliens—for certificates entitling the foreigners to practice medicine in the United States.

While the House of Delegates weighed matters of policy and Association government, the bulk of the 7,000 physicians, surgeons, and specialists in attendance at the convention, registered at the Civic Auditorium.

Scientific Session

A general scientific session at the Opera House in the afternoon brought them together to hear five technical papers read by medical leaders toiling on the outermost fringe of medical research.

Parallel with the Association convention, four medical societies preoccupied with highly specialized fields of medicine held conventions of their own. The Association for the Study of Internal Secretions considered advances of the past year in one of medicine's newest fields of study, glands and their effects on human health, at the Hotel St. Francis.

The American Radium Society, custodians of expert knowledge in the therapy with radium, met at the Hotel Mark Hopkins; the American Association of Medical Milk Commissions considered problems of diet and pure milk at the Clift Hotel, and the American Rheumatism Society held a one-day session on rheumatism and arthritis at the University of California Hospital.

Women's Society

The American Medical Women's Society, organization of women physicians, whose annual convention opened at the Fairmont Hotel Sunday, continued in session, while the Woman's Auxiliary to the American Medical Association, after two brief board sessions, spent the day sightseeing.

The huge scientific and technical exhibit on display at the Civic Auditorium, assembling all the latest techniques for the treatment of disease, as well as modern scientific apparatus, proved a magnet for thousands of the visiting medicos.

Visual demonstration of the ravages of disease, methods of treatment and equipment for treatment, was afforded in several hundred individual exhibits that occupied all three main floor halls of the Auditorium and the mezzanine floor as well. The exhibit is not open to the public.—San Francisco *Examiner,* June 14.

United States Medical Pathfinders Throng San Francisco

Army of Mercy Men Gathering for American Medical Association Annual Convention

Men who measure their greatest achievements as the relief of human suffering assembled in San Francisco yesterday for the eighty-ninth annual convention of the American Medical Association, starting Monday.

They came bearing records of the advance made in medicine during the past year, to hold sessions for exchange of that knowledge so that all humanity will benefit from their work.

Medical Center

During the convention week, June 13 to 17, San Francisco becomes the medical center of the world.

Attention is centered on the sessions and the scientific exhibits which will overflow the Civic Auditorium, and on meetings of the Association's governing body, the House of Delegates, where medicine's advances will be reviewed. . . .

Preliminary Meetings

While last-minute plans were arranged for opening sessions of the convention, preliminary meetings of various branches of medicine were under way.

The American Society of Clinical Pathologists opened its first day of general session at the Palace Hotel with Dr. James B. McNaught of Stanford University as principal speaker.

The American Ophthalmological Society completed the second day of its convention at the Mark Hopkins Hotel. The American Psychiatric Association adjourned its meeting at the Fairmont Hotel.

Sessions of the House of Delegates of the American Medical Association will be held in the Sir Francis Drake Hotel Monday and Tuesday mornings and Thursday afternoon.

Scientific and technical exhibits will be housed in the Civic Auditorium, filling every available square foot of space in Polk Hall. The scientific meetings are to be held in adjacent buildings in the Civic Center.

The scientific exhibit consists of more than 150 displays prepared by leading investigators to demonstrate progress for the year.

The one general assembly of the convention will be in the Opera House on Tuesday evening.

Mayor Rossi, Dr. William Voorsanger, President of the San Francisco County Medical Society, and Dr. William W. Roblee of Riverside, President of the California Medical Association, will welcome the physicians to San Francisco. Doctor Abell will be inducted as president of the national association at the assembly.

The convention of the Woman's Auxiliary also will be held next week. Delegates and guests from all sections of the United States will attend sessions in the Fairmont Hotel. National President Mrs. Augustus S. Kech will preside.—San Francisco *Chronicle,* June 11.

ASSEMBLY OF LABORATORY DIRECTORS AND SEROLOGISTS

Hot Springs National Park, Arkansas October 21–22, 1938

The intensive campaign to stop the spread of syphilis now being waged throughout the country makes it imperative that only those serologic tests of proved efficiency be made available to private physicians and health officers. Diagnosis of syphilis must be prompt and accurate. The serologic blood test, becoming positive within two or three weeks after the onset of primary syphilis and remaining positive in the vast majority of untreated patients throughout the entire course of the disease, is the most important evidence of the existence of syphilis.

The American Society of Clinical Pathologists in coöperation with the United States Public Health Service realized the need for reliable serodiagnostic tests several years ago. The work of the Committee on Evaluation of Serodiagnostic Tests for Syphilis is sufficiently well known to require no comment. It is the opinion of this committee that its studies of the efficiency of the performance of serologic tests have progressed to a point where material gains would be made by a thorough discussion on common ground in which all those interested in the control of syphilis through laboratory methods may participate.

Plans are being developed for an assembly of laboratory workers from the entire country. All such workers, both from private, hospital and public health laboratories, as well as physicians and health officers interested in the control of syphilis, are invited to attend.

The proposed meeting, under the auspices of the Committee on Evaluation of Serodiagnostic Tests for Syphilis, with Surgeon-General Thomas Parran, Chairman, is scheduled for October 21 and 22, 1938, at Hot Springs National Park, Arkansas.

The aims and purposes of the assembly will be to consider means and methods to improve and to make more generally available the serologic tests, which are so important in syphilis control work. Tentative arrangements call for the presentation of the program in four sections.

The first section will consider the need for adherence to conventional technique in the routine performance of reliable serodiagnostic tests. This subject will be considered in papers by Drs. Harry Eagle, William A. Hinton, Reuben Kahn, Benjamin Kline, and John H. Kolmer, with special reference to the tests which each of these workers has described.

Need for training of laboratory personnel will be the subject of the second section. The qualifications and training for both laboratory directors and technicians will be presented in separate papers.

The third section will discuss the prosecution of the studies to evaluate the performance of serologic tests within the states. The efficiency of branch state laboratories and of municipal, hospital and private laboratories cannot be studied on a national basis. The subject is much too large. Should this be made a function of the state or large municipal department of health? Actual experience with such studies in the states of Maryland and New Jersey and in the city of Cleveland will be described.

The fourth section will consider the desirability of licensing or approving for the performance of serodiagnostic tests for syphilis, laboratories within the states by the respective state departments of health. This discussion will be conducted from the standpoint of the private laboratory director by Dr. Frederick H. Lamb of Davenport, Iowa. The health officer's side will be presented by Dr. A. Wadsworth, State Department of Health, Albany, New York.

A separate committee will draft recommendations for each of the four sections for presentation to the assembly. The respective chairmen of these four section meetings will be Drs. Walter M. Simpson, Dayton, Ohio; Arthur H. Sanford, Rochester, Minnesota; F. E. Senear, Chicago, Illinois; and H. H. Hazen, Washington, D. C. General discussion will follow the presentation of each set of recommendations.

An additional feature of the meeting will be an actual demonstration of the performance of the Eagle, Hinton, Kahn, Kline, and Kolmer tests by the originators of these procedures.

It is to be hoped that the attendance at this assembly will be large. Out of the meeting should come a crystallization of opinion with regard to the important problems which will be considered. Those interested in obtaining further information should write to the Surgeon-General, United States Public Health Service, Washington, D. C.

The Antiquity of Rabies.—The following is an excerpt from a book entitled "The Journey of the Flame," which is an account of one year in the life of Señor Don Juan Obrigon, known during past years in the three Californias as the Flame. Born at San Jose del Arroyo, Lower California, Mexico, in 1798, and, having seen three centuries change customs and manners, he died in 1902 at the Great Cardon, near Rosario, Mexico, with his face turned toward the South, written by Antonio de Fierro Blanco." This excerpt is published with the permission of the Houghton Mifflin Company, owners of the copyright.

"One day, having wandered with Inocente through the wild cactus-clothed hills west of La Paz, and killed such hares as we could carry, I sat in the shade of a bush to clean them; since in desert heat game must be quickly cleansed if one would preserve it.

"Being wary by training—for as a small boy at home older ones had often hunted me to my damage—I stood up often to look about me for enemies. It is a great help to be distrustful, for distrust is the parent of long life. As I thus looked about me, I noticed a pair of ears rise from the bushes a long way off, as if a dog jumped aloft the better to scent food.

"This did not please me, as when with Inocente I needed greater care, having two lives then to protect. Therefore, with caution, and standing in the center of a great bush to hide my red hair, I watched. It was a coyote which, following our tracks, jumped in air in order to locate us. Now, the coyote is an animal full of curiosity, and a camp-robber which follows tracks for what he may find, but does not hunt men. Therefore I settled down to my rabbit-skinning without anxiety.

"But in a moment it occurred to me that a coyote thus jumps only when he seeks hares, to locate them as they run and dodge about. When he follows a man's track, seeking camp refuse or leather to chew up, he slinks along, belly almost touching the ground, and taking advantage of every bush for shelter against sight. Therefore, I knew it must be a coyote rabiosa,[1] since being already too insane for thought, he followed only by habit what instinct taught him to destroy. Fearing man no more than he fears a rabbit, the hydrophobic coyote hunts both in the same way.

" 'Run straight ahead,' I ordered Inocente, 'and passing through that brush turn back abruptly on thy trail, and at the clump nearer to us jump as far toward it as you can, and there cower until this business is finished. Thus this coyote will pass you by.'

"But the boy refused, and when I pressed him only said: " 'My mother teaches me that no one of my race ever ran away or hid.'

"Seeing him set, and in not a bad road, I could only advise: 'Hold then thy daggers ready, fool. One in each hand, and guard well thy throat, for this is not child's play. Pray your very best to Saint Hubert, who protects against dog-bite, and who, if now awake, may help us with this mad coyote.'

"Then, watching for the mad beast as every few paces he leaped in air to locate us, I selected a bush ten yards away which he must pass. I planned, when I saw him there, to whistle, so that my first arrow might be aimed before his last quick rush at us came. A mad coyote which hunts men treats them as he does rabbits, at first moving slowly and tactfully so as not to excite his prey. Then, when within striking distance, he gives such a burst of speed as makes him seem like a streak of lightning which arrives at the horizon almost before it has left the zenith.

"Thus we waited, seeing a nose and a pair of ears appear at intervals above the bushes which hid the beast. Each time we saw the coyote's ears they were nearer to us. Inocente, at my elbow, did not once whimper; though I, under stress of my great fear of hydrophobia, kept my nerve only by saying aloud while the beast approached: 'Here comes Tomasa's Pedrillo,' that being the boy I most hated, and in years gone by the first victim of my bow.

"Soon we saw the great beast more plainly. Almost bare of hair he was, as the fires of madness had roasted his body; his eyes blurs of blood, while from his open mouth hung a dry and swollen tongue. When he had reached the bush I had chosen, I whistled sharply, throwing the sound a little to one side to puzzle him. For an instant he stopped; and shouting without knowing what I said, 'Go thou upon thy belly for a week!' I drove a war arrow into his left side, so that, as he bent his neck to bite off the arrow's shaft, his throat might be exposed. Swiftly I sent another arrow into his throat, and no longer filled with foolish fears, took my time in driving a third arrow lengthwise into his body.

"The strain being over, Inocente made me laugh more than I otherwise would have done by asking me: 'Why did you want the coyote to go upon his belly for a week?"

"Had I been alone, I would have gone to see the writhing body, but having the Sanhudo boy to care for, I made a long detour around the coyote and thus back to camp. There are certain animals impossible to kill, and which pretend only to decoy their hunter to destruction. Such a risk I could not take while Dona Ysabel's son was in my charge. Neither of us remembered, until next day, that all the hares I had killed for food were left behind to rot in the desert.

"That night, not being sleepy, I heard through their tent canvas—for as Inocente's guard I slept near by—Dona Ysabel whisper to him several times, as he woke with a start after dreaming of our maldito coyote.

"Doubtless also she put her hand upon his forehead to calm him. So my mother had often done to me when as a child, I slept beside her, and had been unduly excited by my day's sports. Now, nearing twelve, I had become too old for such care; and yet at times one regrets age and its loneliness.

"But I am not the kind which ever hid behind his mother's skirts, nor even before I could walk did I cry 'Mama! Mama!' when older boys beat me. This perhaps was only because of my red hair, which urged me to strike back when struck. Red hair does not carry its owner to Heaven, but as a help through life few things are better."

[1] Coyote rabiosa: coyote afflicted with rabies.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XI, No. 7, July, 1913

From Some Editorial Notes:

Lawyers and Doctors' Fees.— . . . We forget that it is not our moments of time that we are selling to our patients—or more often giving to them—it is our brains, our thought, our experience, the years of suffering we have felt—and seen—and which we have so heart-breakingly tried to prevent. Perchance it is just because we have suffered so much in ourselves and our patients, and feel first for the life of the patient, that it leaves us the poor fools that we are, unable to put a charge upon our advice that would in a measure pay us for the hours of work, anxiety and study that have made it possible to give that advice. Who can put a price on life; on health; on happiness? Least of all the man who is called upon to save and conserve these priceless things, life and health and happiness; for what is life worth without health—and can there be happiness without it? How often do we see the millionaire enjoying his money and his estate, and the physician who saved to him that life, struggling to pay a mortgage on his humble home. Let us, without becoming unduly commercial, try to learn to put a relative value upon everyday things.

From an Original Article on "Intratracheal Insufflation Anesthesia" by Saxton Temple Pope, M. D., San Francisco. Experimental physiology often paves the way for the advance of surgery. In the field of thoracic operations, it not only paved the way, it forced surgery to follow. Physiologists had demonstrated the possibility of maintaining artificial respiration and pulmonary ventilation many years ago. Vesalius, in the sixteenth century, first used the laryngeal tube to produce inflation of the lungs. In animal experimentation, Legallois, Monroe, Magendie, and Marcy, all resorted to an apparatus for artificial respiration, using a tracheal canula. . . .

From an Article on "The Nature of Disease" by W. T. Councilman, M. D., Professor of Pathology, Harvard Medical School, Boston, Mass.—There is difficulty in giving a clear idea of what is meant when we speak of disease, although every individual has a concept of the word when applied personally. In a way, the difficulty might be met by simply regarding disease as the negation or opposite of the normal, but the same difficulty applies to the definition of normal. The trouble is in giving a definition which will apply to the species when all our concepts of the conditions are formed from individual experience. . . .

From an Article on "The Medical Treatment of Gall-Bladder Disease" by Dudley Fulton, M. D., Los Angeles.— Diseases of the biliary tract are somewhat peculiar in that the same lesion in one individual may be latent and harmless, and in another intensely active and full. . . .

From an Article on "Medical Endowment for the University of California."—President Wheeler announced at Commencement Day, May 14, 1913, the George Williams Hooper Medical endowment for Medical Research. The gift is from Mrs. George Williams Hooper in memory of her husband. It consists of a foundation for medical research in connection with the University of California, and under the charge and ownership of the regents of the University. The gift is in the form of property worth considerably more than $1,000,000, and will yield an income of

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By Charles B. Pinkham, M.D.
Secretary-Treasurer

News

"Four staff members of a chiropractic college at 1145 Polk Street stood indicted by the grand jury today on conspiracy charges in what jurors declared was the 'most flagrant' asserted violation of the state professional code in years. The indictments, to be returned before Presiding Judge Louis H. Ward tomorrow morning, were voted against Mortimer E. Timm, director of the college; E. P. Fewer and Dan C. Lindsey, chiropractors, and Densmore Henschell, instructor. The quartet was accused of performing tonsillectomies and plastic surgery—reshaping noses—and of treating social diseases as well as operating a clinic without a license. Ten witnesses, all former patients except one, who said he was a student and assertedly was allowed to practice medicine after only a week's study, testified before the jury, Assistant District Attorney Harry J. Neubarth revealed. The grand jury action climaxed months of investigation by Special Agent Joseph W. Williams of the State Board of Medical Examiners, who posed as a prospective student and observed, he said, a surgical operation." (San Francisco *Call-Bulletin,* May 19, 1938.)

"Extradition of E. P. Fewer, dean of a San Francisco chiropractic college, was asked today by Governor Merriam. The man is held in Houston, Texas, on a San Francisco warrant charging seven counts of conspiracy to violate the Business and Professional Code. He and three others were indicted by the San Francisco Grand Jury on May 20 after testimony that they practiced and taught surgery in the Standard Chiropractic College and Clinic at 1143 Polk Street." (San Francisco *News,* June 6, 1938.)

"As an aftermath of Grand Jury indictments of four men allegedly practicing medicine without a license at a Polk Street chiropractic college, police yesterday prepared to serve a warrant charging M. James McGranaghan, chiropractor-attorney, with delaying and obstructing an officer. McGranaghan, former candidate for Supervisor and for City Treasurer, allegedly struck Joseph Williams, Special Agent for the State Board of Medical Examiners, last Tuesday as he and Agent Thomas Hunter visited the college at 1145 Polk Street in search of evidence. The attorney said he represented three of the accused men. According to Assistant District Attorney Harry J. Neubarth, two, Mortimer E. Timm and Densmore Henschell, have no license of any kind, while the others, E. P. Fewer and Dan C. Lindsey, have only chiropractor licenses. Neubarth said that, in addition to striking Williams, McGranaghan had the officer arrested. . . ." (San Francisco *Chronicle,* May 21, 1938.)

"Charged with delaying and obstructing an officer, M. James McGranaghan, chiropractor-attorney, yesterday was arrested and booked at the city prison. The attorney, a familiar figure in San Francisco's political life, was released on his own recognizance and will appear in Municipal Court today. McGranaghan's arrest was an outgrowth of the Grand Jury indictments of four men allegedly practicing medicine without a license at a Polk Street chiropractic college. The attorney is charged with striking Joseph Williams, Special Agent for the State Board of Medical Examiners, who swore to a warrant for McGranaghan's arrest. Williams said he was struck when he and Agent Thomas Hunter visited the college at 1145 Polk Street." (San Francisco *Chronicle,* May 24, 1938.) (Previous entries October and December, 1927; November, 1934; March and July, 1935; December, 1927; March, 1938.)

ONLY THESE SOLUTIONS ARE VACOLITER PROTECTED

B A X T E R ' S

INTRAVENOUS SOLUTIONS IN VACOLITERS

Are they on your *storeroom shelves? They should be!*

Row on row, in thousands of America's hospitals stand these Vacoliters, keeping their contents of Baxter's Dextrose and Saline Solutions fresh, pure, sterile . . . until a patient needs them. Baxter's Intravenous Solutions in *Vacoliters* have made this storage possible . . . because in Vacoliters Baxter's Dextrose and Saline Solutions stay laboratory pure.

Enjoy the convenience Vacoliters give you. Enjoy the advantage of instant readiness. Enjoy the swiftness of setting up Vacoliters for administration.

Use Baxter's Intravenous Solutions in Vacoliters and you will soon find intravenous routine free from confusion . . . smooth in operation . . . completely satisfying. We find that nurses and doctors alike appreciate the simplicity of intravenous routine in hospitals where Baxter's solutions are used. That is why so many hospitals use Baxter's Intravenous Solutions in Vacoliters day in and day out. They have found them sterile and pure, they have found them economical to use.

Climate and Tuberculosis.—There was a time when consumptives were housed in warm, unventilated rooms, because doctors confused tuberculosis with a "cold." The mystery of malarial transmission caused night air to be feared. Many members of a tuberculous family died in a polluted house, hence the disease was believed to be hereditary and it was considered hopeless; the disagreeable subject became taboo and very little was said or done about it. But about fifty years ago we learned that fresh air is good for tuberculosis and that the disease is curable. At first, certain kinds of air were considered necessary and a belief in special climates arose, particularly those of high altitudes. The salts of sea air and the ozone of pine forests were also highly regarded. About that time the fear of infection became widespread and sanatoria were built, but not fast enough or large enough, and so it was hard for a consumptive to find a place to go. He was shunned at home, but welcomed in desert and mountain. His future was dark where institutions were as yet unbuilt and home treatment was little understood, but the new health resorts advertised a welcome and promised much. If his disease was in the early stage the patient would go West and rough it. If his case seemed hopeless, nevertheless, he must have "his chance." The family doctor, importuned by the patient and harassed by a distracted family, did what was expected of him—advised a "change of climate." In a spirit of high adventure, our youth lent themselves gladly to the movement. It suited them perfectly. Who would remain to bathe seven days a week in familiar air when he might do some great thing and perhaps achieve a speedy cure! So they went forth, some with early, but more with far-advanced, disease, all untrained, ignorant, but hopeful. Those who recovered returned and made the fact known. Those who failed died silently in far places, drifting sands covered their graves, and the facts were not widely advertised. Thus the importance of climate was for a time exalted over the less glamorous elements of treatment.

Patients with better leadership or example, such as Trudeau's, applied themselves diligently to treatment and many recovered. A few courageous physicians began to publish cures in Philadelphia, New York, and Boston; and as the basic principles of treatment became known and treatment facilities increased, hysteria ceased. At the same time we were brought to a sober realization of the magnitude of our tuberculosis problem. Case finding, early diagnosis, and skillful treatment took first place. Recovered patients walked forth upon every street. Local sanatorium graduates held alumni meetings; their slogan was, "Better a good doctor and comforts in the worst climate than a poor doctor or privations in the best." There is evidently some danger of discounting the real value of climate. Good doctors and creature comforts are no longer lacking in our best climates.

In 1899 the United States Public Health Service established a marine hospital at Fort Stanton, New Mexico, for its tuberculous beneficiaries, in harmony with then prevailing ideas. For years there was a waiting list, so great was the demand for transfer from the coastal marine hospitals to this ideal climate 6,200 feet above sea level. But of the first 2,588 patients admitted, 861 died, 130 within one month and 308 others within six months after arrival. It was found necessary to refuse transfers to certain classes of patients, and the Public Health Service now transfers to its New Mexico sanatorium only patients whose temperature and pulse can be brought to normal by rest in bed, believing that climate is not of first importance in the acutely progressing disease. A death seldom occurs there now among the carefully selected patients. They are encouraged to remain a long time to insure a cure, the treatment is superior, and facilities are ample; but merchant seamen, having learned that climate is not all important, are now inclined to belittle its influence and many choose to remain in the general marine hospitals and refuse transfer to the New Mexico sanatorium when selected for it. Many of the best sanatoria in the Southwest have actually been closed for lack of patients. The real value of climate is now often underrated; the pendulum always swings too far.

The Relative Value of Climate.—The most important therapeutic measures in pulmonary tuberculosis are:

FRANKLIN
HOSPITAL

Limited General Hospital with accommodations for 220 patients located in a seven-acre park. Fourteenth and Noe Streets, San Francisco.

Fully approved by the American College of Surgeons and the American Medical Association for Interne Training, and maintaining an Accredited School of Nursing.

Founded 1852

WALTER V. ROHLFFS, Ph. D.
President

LeROY BROOKS, M. D.
Chief of Staff

FRANK SCHMIDT
Superintendent

1. Adequate and intelligent rest in fresh air.
2. Proper and sufficient food.
3. Special therapy, including induced pneumothorax, phrenicectomy, and thoracoplasty.

Comparatively few patients can realize ideal conditions for recovery. A limited purse procures rest for a limited time, or in inadequate degree, and fresh air is often expensive, like choice food. Fresh air is costly in the city, because it means proper housing in a good location. How much that means in a city like New York, for instance, is readily understood. Removal from the city entails expense and other sacrifices. There are differences in climates—certainly some climates are better than others; but excellence of climate is no more essential to a cure than excellence of some other things, and there is no climate so good that it will always make up for increased work, or poorer housing, or scantier fare. Just as a patient may not be able to secure the best house, the best food, or the best doctor, so he may not be able to afford the best fresh air, *i. e.,* the best climate. Each case must be decided on its own merits. For a patient with fever, sweats, and rapid wasting, absolute rest in bed with good ventilation and good nursing outweighs all other considerations. On the other hand, unfavorable climatic conditions, such as oppressive heat, irritating dust, smoke, or fog, may have such a bad effect that change of climate becomes of prime importance.

Preliminary Observation Before Advising Change of Climate.—To advise a change of climate for all patients is unwarranted. Changes are desirable in certain cases, but precipitate haste in sending a patient away is a mistake. The old adage, "Consumption, therefore creosote or Colorado" is equally expressive of therapeutic and climatic ignorance. The patient who should be sent to a distant climate immediately upon diagnosis is exceptional. At the Marine Hospital Sanatorium at Fort Stanton, New Mexico, the results have been nearly three times as good in patients who left the home stations without fever as in those who had a temperature of 38 degrees centigrade or more within two weeks of departure. The number of deaths in those leaving afebrile is to the number in those with fever as 22 to 59, the arrests as 19 to 7½, the apparent cures as 10 to 3. A period of observation is desirable to exclude hopeless cases and permit an intelligent selection of climate if a change is needed.

Hopeless Cases Not to Be Sent to a Distance.—It is not always easy to determine when a case of pulmonary tuberculosis is hopeless, but in general the patient with advanced disease who does not offer some hope of temporary arrest in the home climate, when treated in a local sanatorium, or under other favorable conditions, cannot be expected to improve after a long journey, no matter what the difference in climate. A progressing case of long standing, with abdominal organs already damaged by terminal changes of the disease, will not be greatly benefited by change of climate. Occasionally a critical case recovers or life is prolonged beyond all expectation in a health resort, but the same thing occurs in home climates. It makes little difference to a dying man what the climatic conditions are

(Continued on Next Page)

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water

Steam heated hotel, open all year around.

3000 feet up in the Lake County Pines.

(Since 1870)

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

Information and circulars upon request

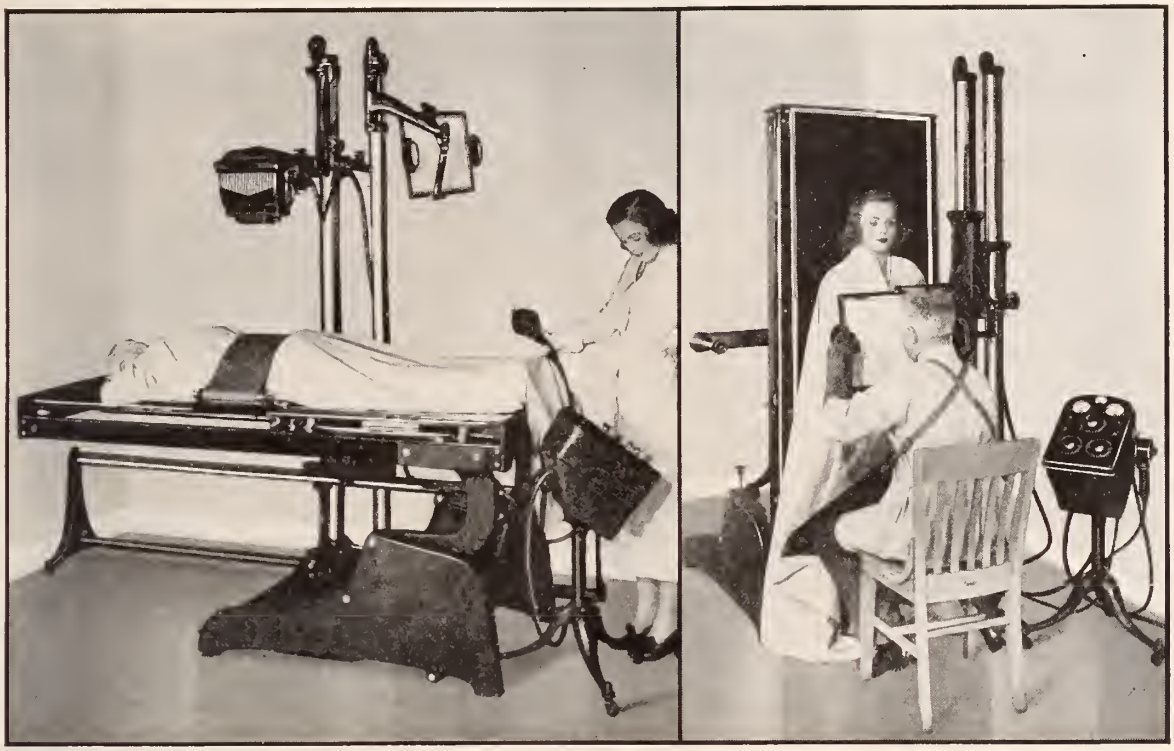
so long as he has proper care; and there is no picture more miserable than the boarding-house life of a consumptive, hopelessly ill among strangers.

The Psychological Moment for Change.—Almost any tuberculous patient who may be expected to recover, as well as many hopeless cases, will, when kept in bed in freely flowing air anywhere, improve for a time and up to a certain point. "After comparative quiescence of the lung process has been reached under treatment at home, and the nutrition is much improved, there comes a stage where further improvement is slow. This is the psychological moment for a change. In speaking of change, I mean a complete change to health resorts in the Far West; or those in the East at considerable distance from the patient's home." (Francine.)

Special Climates.—The selection of patients for high altitudes requires careful study. Such places in the United States are dry, cool, and stimulating, with a large number of clear days and a maximum of sunshine. Concerning the therapeutic effects of diminished air pressure itself authorities differ, some holding it to be indifferent, others assigning it a positive value in dilating the air vesicles and increasing pulmonary circulation. Still others, while granting that many patients are benefited by such climates, believe that a rarefied atmosphere may be harmful because the deeper breating required is opposed to pulmonary rest. All agree upon a large number of contra-indications to high altitudes, such as low vitality and poor circulation, declining powers of heat production, neurasthenia, irritable temperament, acutely progressing disease, dyspnea, nephritis, emphysema, excessive bronchial irritability, dilatation, decompensation or nervous derangement of the heart, and far-advanced disease with much destruction of lung tissue. For young adults without any of the foregoing complications who can and will secure proper medical attendance and submit to the same regimen that is necessary to effect a cure anywhere, the high, dry climate is the best. It has its dangers, one of which is the sense of well-being which may betray one into harmful exercises. It will frequently revive a jaded appetite or mitigate a troublesome moist catarrh at once, and it will add zest to life, but it is not a short cut to health.



Local weather conditions at certain seasons may demand a temporary removal. When crowds of well people press out of a hot city to the nearest cool resorts the doctor may well consider similar relief for his tuberculous patients. The tonic effects of cool air with increased appetite and power of assimilation account for much of the good results from dryness and elevation.

There are certain advantages in undertaking the cure in one's own home climate, and by this term is usually meant places not more distant, for instance, than the confines of the home State. The limitations of a familiar climate are known and will not be presumed upon, whereas the faith inspired by a removal to some especially selected climate often weakens the regimen which is necessary anywhere. Moreover, a return to home climatic conditions is more likely to show a lapse from the careful hygiene which was followed with comfort in a favorable spot, but seems a hardship in more rigorous climes.

The Local Sanatorium.—Preliminary treatment for a few months in a local sanatorium is most valuable in recently diagnosed tuberculosis, whether the patient is later to be treated at home or sent away. The number of these institutions is increasing, and within a few miles of any large city will be found charitable, semicharitable, and private sanatoria for any class of case. The habits of life which the patient must observe to live with or cure his disease in any climate are best learned in an institution where the inmates are devoted solely to the business of getting well. There is, in a well-ordered sanatorium, an esprit de corps among the patients themselves, and intelligent, buoyant, helpful coöperation not altogether unlike college spirit, and the special training afforded likens the sanatorium to a school, as, indeed, it is.

The General Practitioner's Point of View.—The family doctor, having made a diagnosis, absolute or provisional, is immediately confronted with the question, "What are the

New! THE GENERAL ELECTRIC MODEL D3-38 IN ITS RANGE, AN UNSURPASSED VALUE

An Efficient, Compact, Flexible, Combination Diagnostic X-Ray Unit

HERE—*completely new in every respect*—is a modern combination radiographic and fluoroscopic unit that will set another G-E record for *efficiency, ease of operation, flexibility, convenience and economy.*

With its wide range of service, its new, refined, simplified control unit, its flexible, easy-to-operate tilt table with built-in Bucky, the G-E Model D3-38 offers you *bigger dollar-for-dollar value* than any comparable equipment. With it, you can routinely produce *uniformly high quality results,* and accurately duplicate them with ease.

Never before has it been possible for you to own, and at a surprisingly moderate investment, an x-ray unit of this type having the capacity, range and refinements of G-E's new D3-38. Correctly designed and engineered, solid and sound in every inch and part, you can depend on it to give long, satisfactory service, and to be an economical investment. *Before you invest in any x-ray, investigate this fine new unit.* Just clip, sign, and mail the handy coupon, today.

WITHOUT OBLIGATION

best opportunities for recovery within this patient's means?" for, as Edson says, "the best he can get is what we must order, both as regards food, bedroom, and quality of air." If the case is in a family of wealth, he has merely to decide whether a change of climate is desirable and the nature of the change indicated, and advises accordingly. In the vast majority of cases, however, he must weigh the benefits of a change against certain sacrifices usually necessary to effect it, and here must be considered a multitude of details, some of which the family doctor is in a position to decide better than anyone else and for some of which he may need consultation.

If the case has a favorable outlook and a good chance to recover in the home climate, the fact often remains that there would be a still better chance in some other climates. The family doctor desires to prescribe nothing short of the very best conditions. He recalls, too, that a "change of climate" is time-honored advice, the patient expects it perhaps, and there will be less responsibility for an unfavorable outcome if he gives it. He knows the vexations of home treatment and remembers that he has even been accused of mercenary motives in holding certain favorable cases for home treatment. It requires considerable courage to recommend "no change," and the family doctor who undertakes to treat a case of pulmonary tuberculosis in the home is not influenced by financial rewards. Indications for or against removal are found in the home itself. A nervous man or woman may need to be taken from a turbulent household of lusty children, while for a differently constituted patient congenial relatives are indispensable for content. Extreme measures are sometimes necessary to get a careless patient away from helpless associates, or, on the other hand, to save an invalid from false ideas of treatment at the hands of ignorant relatives.

A multitude of counsel confuses the busy practitioner. The merits of various regions are urged. Relatives may insist that the patient be sent away without delay and perhaps raise a question at the same time against the propriety of an ultimate return to home climatic conditions. The doctor knows that good medical attendance is as indispensable in the new climate as the old, and that a sanatorium is as necessary in a distant health resort as in the home city. He recalls sad experiences of early days when his patients thought that they could loiter in smoky lobbies and effect a cure simply because they were breathing the pure air, or the rarefied air, or the dry air of some widely advertised climate.

But it is often easier to persuade a patient to enter a sanatorium at a distant resort than one near home, and sometimes a person can be persuaded to abandon his business pursuits, or a mother to be separated from young children, only by radical removal. The hope afforded by a complete change may be needed when a patient has met repeated reverses or has seen unfavorable outcomes in friends or relatives. The family doctor must study the tastes and habits of his patient. The indications for change are different for a home-loving, carefully nurtured girl than for her bachelor brother. Young adults often welcome a change, whereas, one past middle life, with strong attachment for home scenes, may consider it a hardship. For the very young or the very old a removal simply for change of scene would almost never be indicated. Temperament and previous climatic environment are important. One would not, for instance, send a Norwegian youth to the Azores nor a Creole demoiselle to winter in the Adirondacks. A thin, irritable person, who shrinks at sudden drops in temperature, would not be advised to go to Colorado, nor would a full-blooded, lusty individual ordinarily be directed to a warm beach resort.

In deciding whether a case of pulmonary tuberculosis should have a change of climate, temporary or permanent, remote or near, the doctor must not be bound by any rule, but should be guided in each case by all the attendant circumstances—by the patient's age, sex, social conditions, wealth, temperament, and desires, by the state and activity of the disease and its complications. He will be influenced

by the home climate and the season of the year, but it is safe to say that no place is so unfavorably situated that a change is always necessary and none so fortunate in its location as to preclude the possible advisability of a removal.— F. C. Smith, Medical Director, United States Public Health Service.

What Are the Measuring Sticks by Which All Health Commissioners May Make a Comparative Appraisal of Their Activities?—Health departments and practice have been surveyed, studied, analyzed, compared, inventoried, scrutinized, and demonstrated. These have resulted in an array of conflicting advice, opinions, proposals, and recommendations about which little is done. These experiences have demonstrated, first, the limitations of a survey, and, second, have provided a clearer conception of its probable values, which are worthy of mention.

First: It should not be considered that an appraisal is a scientific evaluation study. Appraisal means "an estimate of worth or value" and the findings should be interpreted merely as an estimate or guide in relation to standard performance.

Second: The more specific the problem or question to be answered, the more valuable the appraisal. Preferably it should be restricted to an individual service rather than an entire program on a total rating basis.

Third: The analysis of mass data, whether they refer to health department records, service reports, morbidity or mortality rates, is not adequate for scientific research, which should be conducted as a special study.

The definition of our problem here calls for an appraisal by the health commissioner, first, of his own program, and, second, for comparison of this program with that of other counties. There are measuring sticks by which his own program can be analyzed, but the comparison with other counties is not a simple one. The implication is that the health problems in all communities are of like degree, and that health department practice can be or should be standardized. Neither of these assumptions is true. The health problems of two communities are not alike, nor is it advisable to standardize health service. Briefly one cannot gauge health department service for purposes of accurate comparison on a total rating mathematical basis.

We know only that the health service requirements of a rural area are not essentially different from a city area, and that the farmer needs approximately the same amount of adequate service as his city cousin.

There are other factors which cannot be measured. One cannot measure enthusiasm, devotion, tact and intelligence of personnel. One cannot gauge administrative ability, scientific accuracy, and higher quality of service by loyal members of a department. Finally, an appraisal is based on quantity rather than quality of service. Rather than the number of the nursing visits or physical examinations, one would wish to know the content of the visit and the thoroughness of the examination. Thus, if we add up items of service, the total is interesting but not informative. On these grounds, we must object to "survey contests." However, such total ratings are not without value in awakening the interest of the public in public health, and it is something the layman can understand.

We must have detailed analyses to be of significance. Low scores will tend to stimulate a health commissioner to improve his own program. Comparisons on specific services can be made with validity to other counties, if these comparisons are based on accepted criteria or accepted health practice.

There are three methods of appraisal with which a health commissioner should be familiar.

First: Reduction in mortality and morbidity.

Second: An assumed dollar equivalent value of the services rendered.

Third: The intensity and number of the services provided.

The first method, the measurement of mortality and morbidity would be the method of choice if the reductions in deaths and illness actually due to the health program could be measured. Sheer chance may cause marked fluctuation of rates in small population units, and reductions may occur from many forces or combinations of forces other than those of the health program. It is not necessarily true that areas with the more adequate health service have the lower trends in rates. In most states the converse is more often true, that community populations with the higher morbidity and mortality rates have the more poorly developed or least adequate health service.

By the second method of appraisal, the total value of the services provided is calculated in dollars by applying specified values to each item of service. A fee schedule is available for distribution by the United States Public Health Service. By this method, according to a list of values, such as $1 for each vaccination, $1 for each nursing visit, $2 for each Wassermann, etc., and applying these assumed values to the statistical report, a total estimate in its monetary equivalent is obtained of the value of the service to the community. However, the method is not a real study of accomplishment as a statistical procedure, but is sometimes useful in obtaining appropriations.

The third method, the use of the appraisal form published by the American Public Health Association, insures very definite results. It constitutes a working manual of accepted public health practice, which every health commissioner should find invaluable to appraise his program every several years. It furnishes the administrator with an activity schedule which brings to light distressingly unbalanced and deficient programs. It may be used for all local work; that performed by official agencies, state and local agencies, and by unofficial voluntary agencies and by private physicians. It is published in two forms, one for city and one for rural work.

The appraisal form is divided into three parts. The first part comprises a list of selected health indices under which may be entered salient points of information of the community population, for comparative reference to similar characteristics of the state, counties, and, if desired, the registration area. It allows for the tabulation of information on population, age distribution, wealth, social and economic status, housing, sanitation, vitality and health, personnel and medical facilities and health practices. (The

Conducted by Sisters of Mercy

Accredited by the American Medical Association and Approved by the American College of Surgeons. Open to all members of the California Medical Association. Accredited School of Nursing and Out-Patient Department.

third part or section is a summary of these characteristics on a percentage or index basis.)

The main body of the form, Part II, deals with administrative practice and provides measurement of achievement. It contains criteria by which each item of service can be compared with accepted standards. Each health procedure has an assigned value, partial credit in points being received for reasonably adequate service. The various divisions of health practice are assigned relative and weighted values; a perfect score in all divisions totals 1,000 points.

Many health commissioners find the survey schedule more valuable as a reference handbook of health procedure than for actual conduct of the tedious performance of scoring. For example, under the first subject of "Vital Statistics, Birth Registration," the following questions occur:

(*a*) Are certificates of births checked locally for completeness and reconciled before being accepted for filing?

(*b*) Is it routine practice to check deaths under one year against certificates of birth?

(*c*) Is there a continuous check of birth reporting or has a periodic check been made within two years?

(*d*) Are birth certificates indexed alphabetically by name?

(*e*) Are supplementary reports of names regularly received and recorded on birth certificates?

Again, for rapid reference, criteria are listed under each item of service by which performance may be checked against accepted standards. For example, if consideration is given to the subject of reporting and registration of tuberculosis cases, the standards require that two new cases and five known living cases be registered per average annual death. From these standards, the health commissioner can calculate rapidly how many active and known living cases of tuberculosis he might expect to have registered for supervision. This procedure may be extended to every item of service, to estimate potential needs, probable case loads, and to measure performance. When tabulated, comparisons valuable for guidance in administration of specific programs may be made with programs of other health districts.

REGULATION

Regulation of the daily program, especially diet and exercise, is beneficial to normal bowel movement and in some cases of constipation serves as sufficient treatment. Others require additional aid to facilitate regular evacuation . . . When an adjunct to diet and exercise is required, as it often is, Petrolagar provides a mild but effective treatment. Its miscible properties make it easier to take and more effective than plain mineral oil. Further, by softening the feces, Petrolagar induces large, well formed stools which are easy to evacuate. The five types of Petrolagar afford a choice of medication adaptable to the individual patient. Petrolagar Laboratories, Inc., 8134 McCormick Blvd., Chicago, Illinois.

Petrolagar . . . Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

Adequate Medical Care. — All diseases have certain social implications and social aspects which must be recognized. The specialist in epidemiology is interested almost wholly in the host-side of the disease process, and it would be difficult to draw a line between epidemiology and medical sociology. In any event, physicians are now compelled to give as much study to the host and his environment as to the disease organism and its environment.

The problem of adequate medical care is of deep interest to every group in our social structure, and the alert physician, above all others, recognizes that the practice of medicine touches every human relationship. The prevention of sickness so far as possible by the extension of all health services is the logical first step in any plan and that there must be a more complete coördination between the efforts of those engaged in curative and those engaged in preventive medicine. The doctrine that curative medicine is wholly an individual affair and that preventive medicine is the function of the state is no longer tenable, for one cannot make a hard and fast distinction between the two.

Whatever changes are brought about we must protect, on the one hand, the high quality of medical service and, on the other, promote the public health in every way possible. These two objectives are not incompatible; indeed, they are identical!

Science now knows that each individual is born with a very rich but a fairly well-mixed heritage. What has been learned about heredity and genetics makes it reasonably sure that we are nearly all potential geniuses or criminals. It is the kind of world or place in which we are born and reared that determines in a large measure what we become. I do not say that environment is more important than heredity. The one cannot exist without the other. Both are equally important. What I do say is that these two factors, race and place, heredity and environment—control the form, the structure, and the behavior of every living thing. There is no third influence.—Dr. R. R. Spencer, United States Public Health Service Senior Surgeon.

To a lazy boy on a warm summer day sleep comes easily. To a patient oppressed by fear of operative procedure or illness, sleep may be difficult. Under such circumstances sleep is essential—and often the use of a safe sedative will prove beneficial.

Ipral Calcium has been used for over 12 years as a safe, effective sedative. No untoward organic or systemic effects have been reported from its use in the usual therapeutic doses. It produces a sleep closely resembling the normal from which the patient awakens generally calm and refreshed. Ipral Calcium is readily absorbed and rapidly eliminated. Undesirable cumulative effect may be avoided by proper regulation of the dosage.

Ipral Calcium (calcium ethylisopropylbarbiturate) is supplied in 2-gr. tablets and in powder form for use as a sedative and hypnotic, and in ¾-gr. tablets for use where it is desired to secure a continued mild sedative effect throughout the day.

Ipral Sodium (sodium ethylisopropylbarbiturate) is supplied in 2-gr. capsules for hypnotic use and in 4-gr. tablets for pre-anesthetic medication.

Elixir Ipral Sodium—Useful where a change in the form of medication is desirable. One teaspoonful represents 1 gr. of Ipral Sodium. Available in 16-fl. oz. bottles.

Dangerous Tick Bites Avoidable by a Few Simple Precautions.—Fear of the tick that carries Rocky Mountain spotted fever in the East need not keep people indoors this summer. The tick's principal danger lies in its bite. Bites can be avoided by a few simple precautions, according to Dr. F. C. Bishop of the Bureau of Entomology and Plant Quarantine, United States Department of Agriculture. At the same time, Doctor Bishopp emphasizes, failure to take these precautions may have serious consequences. The East has an unusually large number of common dog, or wood, ticks this year—some being reported for the first time from vacant city lots. Even though only one in several hundred of these ticks may carry the fever virus, that one tick, which cannot be distinguished from the rest, is an agent of death. No cure for Rocky Mountain spotted fever is known. Its mortality rate is one out of every five persons infected.

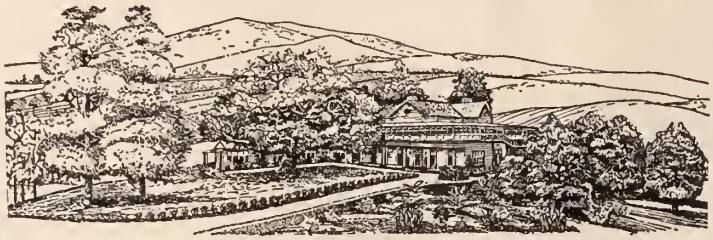
After passing the first part of its life as a small parasite on field mice, the tick now waits in tall grass and underbrush for larger host animals. Cutting all grass and underbrush around houses and pathways, therefore, is one way to protect dogs and people from tick bites.

Keeping ticks from gorging themselves on the blood of dogs is another protective measure. A pair of forceps is all that is needed in removing ticks from dogs to which only a few have attached themselves. Dusting every five days with derris powder is necessary for dogs supporting a large number of ticks. Ticks should be handled with great care, Doctor Bishop points out. Infection can be contracted by crushing a tick full of blood from an animal that has had the fever.

Boots laced up over trouser legs protect men walking through tick-infested areas. Ticks are usually picked up from grass or weeds close to the ground.

Ticks always work their way upward before attaching themselves to their human host. The back of the neck and head are their favorite feeding places. Careful examination of heads, especially children's, at least twice a day, will reveal the presence of a tick in time to prevent a fatal bite. Examination of the whole body is necessary after exposure to ticks. An effective way to detick clothes is to place them in a vessel that can be tightly covered, and set on top of them a pan containing half a teacupful of carbon tetrachlorid or carbon disulphid. A few hours of such fumigation kills the ticks.

"Don't wait for the doctor to remove a tick," Doctor Bishop warns. The important thing is to get the tick off as soon as possible. Anyone can disinfect the bite and the surrounding tissues by inserting into the exact spot where the tick was attached a round toothpick that has been dipped in iodin and drilling it in slightly.



The American dog tick is widely distributed throughout the United States east of the Rocky Mountains, as well as in western and northern California and in parts of Oregon. It is most numerous along the eastern coast from Massachusetts to Florida, especially within a few miles of the shore. Both Texas and Florida have a great many ticks—also some inland areas, such as southern Iowa and parts of Wisconsin and Minnesota. Islands off the coast of Massachusetts and of South Carolina are heavily infested with ticks, especially Martha's Vineyard, Nantucket, and Naushon. Tick numbers fall off along the sea coast from Marion, Massachusetts, westward. The Narragansett Bay islands are rather heavily infested. A few ticks have been reported on the west side of that bay and as far west as Stonington, Connecticut. There are large numbers of ticks on Long Island, especially the eastern half, and along Chesapeake Bay in Maryland. It is rarely seen west of the Blue Ridge.

Making Headlines.—Early this month Chicago newspapers got together with medicine, though apparently not at the invitation of medicine in general, with the probable result that whatever progress may have been made toward more satisfactory coöperation between the medical profession and the popular press has suffered and will suffer a set-back.

The case was that of a five weeks' old baby "doomed to death, or a life of blindness," as the newspapers put it, suffering from glioma. Spectacularly dramatized was the need for a decision by the child's parents between letting nature take its course toward inevitable death and an operation removing sight forever.

Without question, there were aspects of the saddest possible nature involved—aspects on which newspaper sob-sisters could work their readers into a frenzy of agony. Screaming headlines, pictures of the principals, interviews with butchers, lawyers, and society women on what they would do if it were their baby.

If it was not a good story in its own right, the newspapers made it one, but in general did not create an entirely favorable impression of the medical profession, nor an entirely fair one. Glioma may not be commonplace, but probably there were many other cases confronting Chicago doctors at the time that were at least as serious, if not as dramatic. Daily medical routine in any large city is crowded with cases which would make front-page copy if the sob-sisters could learn about them. And with all the alleged conferences and arguments among members of the profession publicized, it is just possible that the public might have been as thoroughly impressed with what seemed to be the uncertainty of the medical profession as with its dramatic fight to preserve life.

All in all, the case seemed to be one of those which makes most doctors wary of the popular press, and consequently retards the development of a kind coöperation and mutual understanding which would provide the public with information of a more desirable type.—*Victor News.*

Cancer.—The sharp increase in the rate of death from cancer may well be more statistical than real, according to authorities. They point out that two factors contribute largely to it:

1. The upward trend in age levels of our population. As more people live longer, reaching the so-called cancer belt—over forty—there are, naturally, more deaths from this malignant disease. Improved techniques for dealing with tuberculosis, malaria, scarlet fever, etc., leave more people for the degenerative diseases of old age, among them cancer.

2. Improved diagnostic techniques: when a person dies of cancer now it is recognized as such. Lack of skill in diagnosis usually explains the legends that certain primitive peoples, among them the American Indians, never had cancer.

Cancer of the breast in its early stages is one of the most curable of serious diseases. If taken when still local, it may be cured in 75 per cent of the cases, according to the American Society for the Control of Cancer.

What causes cancer—sudden, wild growth of certain cells along one of the milk ducts—is not entirely understood. It is probably due to chronic irritation of some sort and to hereditary susceptibility.

Good rules for guarding against cancer of the breast:

1. Go to a physician as soon as one notices a lump in the breast. Only 10 or 15 per cent of these will be cancer, but they should be promptly investigated. It is dangerous "to wait to see what will happen" to such a lump. If because of delay cancer cells have metastasized or spread to other parts of the body, the odds are five to one against a patient instead of, as in early cancer, three to one in her favor.

2. Be sure to have a complete physical examination once a year by a competent physician.

Despite the widespread popular belief, a blow on the breast will not cause cancer, declare the experts associated with the American Society for the Control of Cancer.

Men used to say society could not exist without the support of a leisure class. Nowadays we look upon leisure, not as the privilege of one class, but the birthright of every man and woman. Moreover, an automatic effect of our machine age has been to increase leisure. Happiness comes, not from work and rest, but from a proper balance of work, leisure, and rest; rightly understood, therefore, leisure is the time, not for rest but recreation, not for indolence but for free beneficial activity. It helps to keep the door of hope open, enabling us to take advantage of passing opportunity, to grow, and to progress. Character, if we may believe biographers, is formed to a considerable extent in a man's hours of leisure. Whatever his daily job may be, rules and routine make him act in a certain approved way. What is demanded of him is teamwork. It is only after man punches "out" on the time-clock that he is free. Note what he does when he has nothing to do and you can tell what kind of a man he is.

ACOUSTICON

Acoustiscope

The Acoustiscope, by principle now being employed in television, gives visibility to sound and permits you to see what you hear.

We would be pleased to demonstrate this marvelous, new, scientific instrument to you, so that you may better understand the thoroughness with which we fit an Acousticon Hearing Aid to an individual person's needs.

Summer Health Hazards.—This is the season of the year when it becomes customary for public health officers to issue vacation "do's and "dont's." There is, seemingly, no end to the admonitions along health lines that may be given to individuals who are going into the country for their vacations. The list of hazards is long, and many of the more spectacular type occur so rarely that they may be classed as uncommon. Nevertheless, all vacationists may become informed, easily, upon methods by which such hazards may be avoided. Among them are the following: Snake bite; poison oak; mussel poisoning; heat stroke; sunburn; polluted drinking water; contaminated milk; infected "cream-filled" bakery products; mosquito bites; flies and gnats; black widow spiders; food poisoning in general; overexertion; automobile accidents; swimming hazardously; firearms; fireworks; rabid animals; infected rodents (squirrels, rabbits, chipmunks); ticks; fleas; "athlete's foot" and many others.

Local health officers may well be prepared to issue instructions in the prevention of such hazards. The California State Department of Public Health will be glad to provide health officers with all specific information upon these subjects that may be available. It is possible to spoil, unnecessarily, the vacation of an individual who may have a phobia on summer health hazards and it may also be possible to prevent suffering and possible death through the dissemination of timely information to a receptive vacationist.

More Drugs for Insured Germans.—Purchases by the krankenkassen are said to account for 80 per cent of Germany's domestic business in medicinal and pharmaceutical products, according to a report from the American Consulate General, Frankfort-on-Main. Such purchases amounted to 143,600,000 marks in 1937, which compares with 137,716,000 marks in 1936 and 151,584,000 during the preceding year.

The krankenkassen had an average membership of 20,200,000 persons, not including family dependents of members who were also covered, during the first three quarters of 1937, against 19,400,000 in the corresponding months of the preceding year. That the increase in medicinal purchases recorded by this agency did not result solely from larger membership is indicated by the fact that the average expenditure per person increased from 5.08 marks in the 1936 period to 5.19 in 1937, the report points out.

If you are really psychologically grown up you must realize that no child belongs to his parents. The parents have the duty of providing the child with the training necessary to enable him to emancipate himself from the family, and, with maturity, to carry on his own life independently of his parents. No child owes his family a debt of gratitude or obedience or filial duty. No normal parent can or will demand these things. Most of the family conflicts that occur arise from ignorance of this simple biological, sociological, and psychological law.—W. Beran Wolfe, M.D., in *A Woman's Best Years.*

WHATEVER the influences that cause insomnia, DIAL "Ciba" brings forgetfulness through its effective hypnotic properties. Sound, restful sleep comes and soon the dreaded night is past. Morning usually finds the patient in a more cheerful frame of mind.

Wherever there is need for a good hypnotic or sedative, DIAL (diallylbarbituric acid) is indicated—in nervous insomnia, mental and traumatic agitation, preanesthetic sedation, etc. Solution of DIAL with Urethane is suggested when intramuscular administration is desirable as in obstetrical analgesia.

SUMMIT, NEW JERSEY

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

Rabies Control Aided by Coöperation of Dog Owners. Hundreds of requests for information on rabies come every year to the United States Department of Agriculture. Dr. H. W. Schoening of the Bureau of Animal Industry of the United States Department of Agriculture makes these timely observations:

Rabies is one of the great menaces to dogs. Dog owners and others can help to control this disease by familiarizing themselves with precautions. During the summer months, when many tourists take dogs with them in automobiles, opportunities for spread of the disease increase. Doctor Schoening cites a recent case in which a tourist brought a dog from a distant state into a large eastern city. A short time later the dog developed rabies. Doctor Schoening emphasizes the importance of obtaining veterinary counsel whenever a dog, especially a strange dog, shows symptoms of rabies.

Common Symptoms

The symptoms of rabies are quite characteristic and may be divided into two types—the furious or irritable, and the dumb or paralytic.

In the furious form of rabies there is a marked change in the disposition of the animal which should arouse suspicion. An affectionate dog may become morose and depressed, whereas a snapping animal may become cowardly or affectionate. This stage is followed in a few days by an irresistible tendency to roam. The dog fights or bites at anything that interferes with its freedom. On returning home after its wandering, the dog frequently seeks a secluded place. Although the secretion of saliva may become excessive through inability of the dog to swallow, foaming at the mouth is not a common symptom, as sometimes believed.

The dumb or paralytic form of rabies is less common than the furious type. The affected dog is depressed from the beginning and hides. The first symptom commonly noted by the owner is paralysis of the lower jaw, as a result of which the animal may be suspected of having a bone in its throat. The paralysis progresses until the animal dies.

Some countries, notably England and the Territory of Hawaii, are entirely free of rabies. They have prevented the introduction of the disease by a quarantine on dogs offered for import, combined with other precautions rigidly enforced. In countries where the disease is already present, the most dependable measures are licensing, impounding destruction of stray dogs, and quarantine measures. A further aid is preventive vaccination.

Preventive Vaccine

Experiments conducted by the Bureau of Animal Industry indicate that resistance to rabies can be increased in many dogs not already exposed by a single injection of rabies vaccine. This resistance is only relative, however. It may be strong in some animals, but weak or lacking in others. Thus some animals can withstand actual exposure to the disease, whereas others may not. Hence, vaccination is only an aid to the standard control methods already mentioned. Prophylactic rabies vaccine is an entirely safe product as now manufactured under federal supervision. It contains no living virus and thus cannot cause or spread the disease. This point is emphasized by Bureau officials despite contrary statements by persons opposed to preventive vaccination.

The variable results obtained from vaccination have caused differences of opinion concerning its value. These differences, Doctor Schoening urges, should not interfere with full coöperation and support by dog owners and veterinarians of other standard measures for controlling the disease.

Sewer gas has been credited with being responsible for a host of evil effects upon health and the influence of this line of thought still persists in plumbing codes. The great majority of the lay public still hold to the belief that bad odors are injurious to health and become quite outraged when a health authority fails to get excited about foul smells which may not have any health significance whatever.—The Health Officer.

The New is the child of the Old.

A STUDY FOR THE DOCTOR

A STUDY of the subject of irritation of the nose and throat due to smoking has been reported in the pages of a scientific journal. It describes the method for evaluating the irritant properties of cigarette smoke and the results obtained.

This study shows conclusively that cigarettes made by the Philip Morris method of manufacture are definitely less irritating.

Reprints* of this and other articles on the subject of irritation due to smoking will be sent on request.

"I use Cutter's Tetanus Antitoxin syringe. It's handier and smoother working; and besides, with Cutter's I've practically forgotten there is such a thing as a serum reaction."

Cutter's antitoxin syringe is handier and smoother working because we "planned it that way." Cutter antitoxins need no knocked down syringe to create the optical illusion of concentration, so the syringe was designed from the single standpoint of convenience and ease of administration.

A special "cracking" process brings you an antitoxin which is almost a pure solution of anti-bodies . . . free from a large part of the reaction producing fraction of the serum.

Cosmetics and Your Patient's Morale

SERVICE with Luzier's

THE DOCTOR IS OF NECESSITY A STUDENT OF LIFE. Each new patient presents a new study, a new problem. Psychology plays an important role in the course of treatment he prescribes. With some patients he must be frank to a point of harshness, with others he must be gentle and coaxing. The nature of the illness and, more particularly, the nature of the patient determine his attitude. He knows from experience the value of bolstering his patient's morale. As a student of psychology he knows that few things are more depressing to a woman than the fear that she is losing her charm, that when she no longer cares how she looks the chances are she has lost touch with a vital interest in life. And because he appreciates the importance of a sensible interest in personal appearance he quite rightly encourages his patients to look their best at all times. FINE COSMETICS appeal to that interest. That is why they deserve to be recommended by doctors who are, after all, greatly concerned with their patient's morale.

Communications for the Cancer Commission should be addressed to the Secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

(Roster lists of officers of scientific section, component county societies, Woman's Auxiliary, A. M. A. delegates, special committees, etc., are continued on advertising pages 4 and 6.)

ISOPHRIN

TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel Laboratories.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

THE LONDON LANCET says: "There are two spots in the world with the most equable climate. One is Assuan, Egypt, the other is a little town in the foothills of the Santa Cruz Mountains in California, called Los Gatos."

Rates, Information and Booklet on Request

REGULATION

Regulation of the daily program, especially diet and exercise, is beneficial to normal bowel movement and in some cases of constipation serves as sufficient treatment. Others require additional aid to facilitate regular evacuation . . . When an adjunct to diet and exercise is required, as it often is, Petrolagar provides a mild but effective treatment. Its miscible properties make it easier to take and more effective than plain mineral oil. Further, by softening the feces, Petrolagar induces large, well formed stools which are easy to evacuate. The five types of Petrolagar afford a choice of medication adaptable to the individual patient. Petrolagar Laboratories, Inc., 8134 McCormick Blvd., Chicago, Illinois.

Petrolagar . . . Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

ROSTER OF COUNTY MEDICAL SOCIETIES, CALIFORNIA MEDICAL ASSOCIATION

(County society secretaries are requested to promptly notify "California and Western Medicine" when changes are indicated in their roster information.)

Alameda County Medical Association
2404 Broadway, Oakland

President, Clarence A. DePuy, 230 Grand Avenue, Oakland.
Secretary, Gertrude Moore, 2404 Broadway, Oakland.
Meeting, *Third Monday, 8:15 p. m., Hunter Hall, Oakland.*

Butte County Medical Society

President, Raymond Kilduff, 322½ Meyers Street, Oroville.
Secretary, J. O. Chiapella, 131 Broadway, Chico.
Meeting, *Second Thursday.*

Contra Costa County Medical Society

President, Selby H. Marks, Grabstein Bldg., Pittsburg.
Secretary, Thomas J. Dozier, 202 G Street, Antioch.
Meeting, *Second Tuesday, 8 p. m.*

Fresno County Medical Society

President, Henry A. Randel, Box 2308, Fresno.
Secretary, Lester R. Nielson, 1006 Mattei Bldg., Fresno.
Meeting, *First Tuesday, University-Sequoia Club, Fresno.*

Humboldt County Medical Society

President, Francis M. Stump, Crescent City.
Secretary, Lawrence A. Wing, Fifth and F Streets, Eureka.
Meeting, *First Thursday.*

Imperial County Medical Society

President, Henry B. Graeser, 115 E. Fifth Street, Holtville.
Secretary, William A. Clarke, Holtville.
Meeting, *Third Tuesday, 7 p. m., Barbara Worth Hotel, El Centro.*

Kern County Medical Society

President, Harry W. Lange, Hopkins Bldg., Bakersfield.
Secretary, C. S. Compton, 428 C Street, Bakersfield.
Meeting, *Third Thursday, 8:30 p. m.*

Kings County Medical Society

President, P. K. Edmunds, Corcoran.
Secretary, William A. Johnstone, Hanford.
Meeting, *Second Monday, 8 p.m., Legion Hall, Hanford.*

Lassen-Plumas-Modoc County Medical Society

President, C. I. Burnett, Susanville.
Secretary, Fred J. Davis, Jr., Westwood.
Meeting, *On Call.*

Los Angeles County Medical Association
1925 Wilshire Boulevard, Los Angeles

President, Ralph B. Eusden, M. D., 412 Professional Bldg., 117 East 8th St., Long Beach.
Secretary, George D. Maner, 1925 Wilshire Boulevard, Los Angeles.
Meetings, *First and Third Thursdays, 1925 Wilshire Boulevard, Los Angeles.*

Marin County Medical Society

President, W. Scott Polland, Albert Building, San Rafael.
Secretary, Carl W. Clark, 510 B Street, San Rafael.
Meeting, *Fourth Thursday, 6:30 p. m., Marin Golf and Country Club.*

Mendocino-Lake County Medical Society

President, Charles A. Craig, Lakeport.
Secretary, Robert B. Smalley, Willits.
Meeting, *On Call.*

Merced County Medical Society

President, E. M. Soderstrom, Merced.
Secretary, Fred O. Lien, Shaffer Bulding, Merced.
Meeting, *Third Thursday, Hotel Tioga, Merced.*

Monterey County Medical Society

President, Curtis B. Gorham, 215 Franklin Street, Monterey.
Secretary, Harold R. Lusignan, 215 Franklin Street, Monterey.
Meeting, *First Thursday.*

Napa County Medical Society

President, Walter Rapaport, Imola.
Secretary, M. M. Booth, Bruck Building, St. Helena.
Meeting, *First Wednesday.*

Orange County Medical Society

President, G. Wendell Olson, 211 No. Pomona St., Fullerton.
Secretary, Glenn Curtis, 323 So. Pomona Street, Brea.
Meeting, *First Tuesday, 8 p. m., Chapel of the Orange County Hospital, Orange.*

Placer County Medical Society

President, C. Ettrick Lewis, 59 Lincoln Ave., Auburn.
Secretary, Robert A. Peers, Colfax.
Meeting, *At Call of President.*

Riverside County Medical Society

President, D. D. Roos, Corona.
Secretary, Thomas A. Card, 3616 Main Street, Riverside.
Meeting, *Second Monday, 8 p. m., Library, Riverside Community Hospital.*

Sacramento Society for Medical Improvement

President, Dave Dozier, California State Life Building, Sacramento.
Secretary, Glenn E. Millar, 321 Physicians Building, Sacramento.
Meeting, *Third Tuesday, 8:30 p. m., Auditorium, Sacramento.*

San Benito County Medical Society

President, J. M. O'Donnell, Hollister.
Secretary, L. E. Smith, Hollister.
Meeting, *At Call of President.*

San Bernardino County Medical Society

President, Delbert B. Williams, 401 North Eighth Street, Colton.
Secretary, A. E. Varden, Medico-Dental Building, San Bernardino.
Meeting, *First Tuesday, 8 p. m., San Bernardino County Charity Hospital.*

San Diego County Medical Society
Fourteenth Floor, Medico-Dental Building, 233 A Street, San Diego

President, Bryant R. Simpson, 1205 Medico-Dental Building, San Diego.
Secretary, W. H. Newman, Medico-Dental Building, San Diego.
Meeting, *Second Tuesday, El Cortez Hotel.*

San Francisco County Medical Society
2180 Washington Street, San Francisco

President, William C. Voorsanger, 490 Post St., San Francisco.
Secretary, Stanley H. Mentzer, 2180 Washington Street, San Francisco.
Meetings, *Every Tuesday, 8:15 p. m., 2180 Washington Street, San Francisco.*

San Joaquin County Medical Society

President, A. C. Boehmer, Box 306, Lodi.
Secretary, George H. Rohrbacher, Medico-Dental Building, Stockton.
Meeting, *First Thursday, 8:15 p. m., Medico-Dental Club Rooms, Stockton.*

San Luis Obispo County Medical Society

President, Frederick R. Mugler, 1170 Marsh Street, San Luis Obispo.
Secretary, E. D. Anderson, 1120 Morro Street, San Luis Obispo.
Meeting, *Third Saturday, 6:30 p. m., Mulholland's Grill, San Luis Obispo.*

San Mateo County Medical Society

President, Hartzell H. Ray, 23 Second Avenue, San Mateo.
Secretary, J. Garwood Bridgman, 205 Third Avenue, San Mateo.
Meeting, *Fourth Wednesday, Benjamin Franklin Hotel, San Mateo.*

Santa Barbara County Medical Society

President, E. J. Lamb, 1515 State Street, Santa Barbara.
Secretary, J. Jerome Rupp, 16 E. Junipero Street, Santa Barbara.
Meeting, *Second Monday, Cottage Hospital.*

Santa Clara County Medical Society

President, E. O. G. Schmitt, 608 Medico Dental Bldg., San Jose.
Secretary, Leslie B. Magoon, Medico-Dental Building, San Jose.
Meeting, *Third Wednesday, 8 p. m., Medico-Dental Building, San Jose.*

Santa Cruz County Medical Society

President, Dean S. Woodard, Stoesser Bldg., Watsonville.
Secretary, Samuel B. Randall, 84 Walnut Avenue, Santa Cruz.
Meeting, *First Monday, 7:30 p. m., Club Rio del Mar, Aptos.*

Shasta County Medical Society

President, Mathew D. Pratt, Fall River Mills.
Secretary, Morton J. Murphy, Shasta County Hospital, Redding.
Meeting, *Second Monday.*

Siskiyou County Medical Society

President, J. B. McGuire, Mt. Shasta.
Secretary, Victor W. Hart, 113 No. Oregon Street, Yreka.
Meeting, *Second Sunday.*

Solano County Medical Society

President, Ream S. Leachman, 727 Sonoma St., Vallejo.
Secretary, John W. Green, Box 539, Vallejo.
Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society

President, Alfred A. Thurlow, 505 B St., Santa Rosa.
Secretary, C. M. Carlson, 534 B Street, Santa Rosa.
Meeting, *Second Thursday.*

Stanislaus County Medical Society

President, Joseph L. Azevedo, Jr., 1024 "J" Street, Modesto.
Secretary, Hoyt R. Gant, 401 Beaty Building, Modesto.
Meeting, *Second Friday.*

Tehama County Medical Society

President, Donald E. Thompson, Red Bluff
Secretary, F. J. Bailey, Red Bluff.
Meeting, *At Call of President.*

Tulare County Medical Society

President, E. R. Zumwalt, Tulare.
Secretary, Karl F. Weiss, Security First National Bank Building, Visalia.
Meeting, *Sunday Evening once a month.*

Ventura County Medical Society

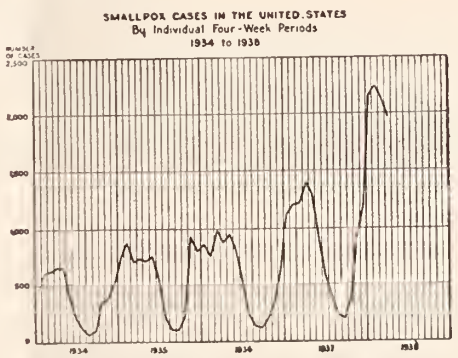
President, Grundy C. Coffey, Bank of America Building, Ventura.
Secretary, A. A. Morrison, 625 Main Street, Santa Paula.
Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society

President, Charles S. Roller, Woodland Clinic, Woodland.
Secretary, W. J. Blevins, Jr., Woodland.
Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society

President, Neal M. Loomis, Yuba City.
Secretary, Fred W. Didier, Wheatland.
Meeting, *Second Tuesday.*



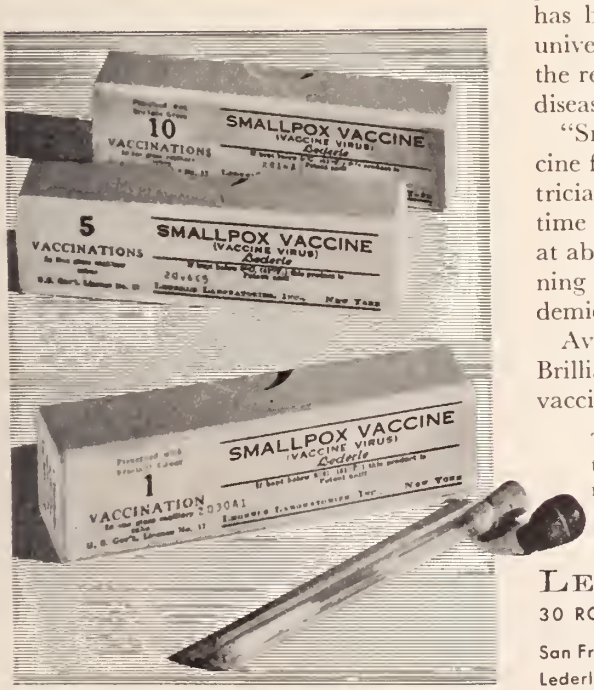
(Roster lists continued on advertising page 6)

Probably the most easily preventable disease is

SMALLPOX

—And yet SMALLPOX has been appearing with a more and more disheartening frequency of late.

Four years ago it seemed that this dangerous disease was at last coming under control and that it was only a question of time when smallpox would be finally eliminated as a major health problem in this country; but, the accompanying chart shows how far from this goal we are to-day.



From the Statistical Bulletin, Metropolitan Life Ins. Co., 19: No. 5 (May) 1938.

By the application of the relatively simple procedure of universal vaccination, and at a nominal cost per person, Smallpox can be completely banished. This has been proven in certain foreign countries where universal vaccination has been strictly enforced, with the result that they have been entirely free from the disease for years.

"Smallpox Vaccine *Lederle*" is a safe, effective vaccine for use in immunization against smallpox. Pediatricians recommend that a child be vaccinated by the time it has reached the age of six months and again at about six years of age (preferably before the beginning of the Fall school term), and whenever an epidemic of smallpox is present.

Available in two forms: U.S.P. and "preserved with Brilliant Green", in capillary tubes for 10, 5 and 1 vaccination each.

The pressure puncture method of vaccination without the use of a shield or dressing is recommended as a method of choice by the National Institute of Health.

Secretary, Celestine J. Sullivan, 490 Post Street, San Francisco.

* Deceased.

Are You Sure?

In some cases you probably prescribe two to three teaspoons of cod liver oil daily as an antirachitic for infants six months of age or older. . . . But **are you sure** that the baby actually receives the cod liver oil? Do you not find that all too often the mother neglects this daily task, or the baby refuses to take the dosage?

In prescribing Special Morning Milk you are assured that when the full tall can (13 fluid ounces) is included in the twenty-four hour formula (and this usually is the case for infants six months of age and older) the baby is receiving at least 1¼ teaspoons of cod liver oil equivalent in Vitamin D. The "daily battle" of forcing cod liver oil upon the child is eliminated. Furthermore, Special Morning Milk is available at all leading retail grocers at no extra cost over other evaporated milks having a lesser amount of added vitamin D.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA AUTHORIZED BY THE AMERICAN MEDICAL ASSOCIATION TO MAKE THE CLAIM THAT THE AMOUNT OF VITAMIN D ADDED IS GREATER THAN THAT USUALLY REQUIRED FOR THE PREVENTION OF RICKETS IN NORMAL INFANTS AND THUS THAT A MARGIN OF SAFETY IS OFFERED WHEN TAKEN IN THE QUANTITIES CUSTOMARILY PRESCRIBED BY THE PHYSICIAN.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA USING COD LIVER OIL CONCENTRATE AS ITS SOURCE OF VITAMIN D.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA CONTAINING 400 U.S.P. UNITS OF ADDED VITAMIN D PER TALL (13 fluid ounces) CAN OR ANY ADDED VITAMIN A. (2000 U.S.P. UNITS VITAMIN A ADDED TO EACH TALL CAN.)

No Cod Liver Oil taste in the Milk!

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY—FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

THE NEW YORK POLYCLINIC

MEDICAL SCHOOL AND HOSPITAL

(Organized 1881)

(The Pioneer Post-Graduate Medical Institution in America)

For the General Surgeon

A combined surgical course comprising General Surgery, Traumatic Surgery, Abdominal Surgery, Gastro-Enterology, Proctology, Gynecological Surgery, Urological Surgery, Thoracic Surgery, Pathology, Roentgenology, Physical Therapy, Operative Surgery and Operative Gynecology on the Cadaver.

Obstetrics and Gynecology

A full-time course. In Obstetrics: Lectures; prenatal clinics, witnessing normal and operative deliveries; operative obstetrics (manikin). Gynecology: Lectures; touch clinics; witnessing operations; examination of patients, pre-operatively; follow-up in wards post-operatively. Obstetrical and Gynecological pathology. Regional anesthesia (cadaver). Attendance at conferences in Obstetrics and Gynecology. Operative Gynecology on the Cadaver.

FOR INFORMATION ADDRESS

MEDICAL EXECUTIVE OFFICER 345 West 50th Street, New York City

MULFORD COLLOID LABORATORIES

H. K. MULFORD, Founder

RHUS VENENATA ANTIGEN

(Poison Oak Antigen)

Williams and MacGregor report "The most striking feature was the rapid improvement, usually after a single dose . . ." In their series of twenty-six patients from the New York Skin and Cancer Hospital, only one patient failed to show improvement until the third dose was given. Williams concludes, "The results to be obtained by this method are nothing less than brilliant."

The Antigens reported by Strickler, Williams, MacGregor, and Bivings are made exclusively by The Mulford Colloid Laboratories, U. S. Government License No. 102, and are accepted by The Council on Pharmacy and Chemistry of The American Medical Association.

Summer-Time Use of Oleum Percomorphum.—During the hot weather, when fat tolerance is lowest, many physicians have found it a successful practice to transfer cod liver oil patients to Mead's Oleum Percomorphum.

Due to its negligible oil content and its small dosage, this product does not upset the digestion, so that even the most squeamish patient can "stomach" it without protest.

There are at least two facts that strongly indicate the reasonableness of the above suggestion: (1) In prematures, to whom cod liver oil cannot be given in sufficient dosage without serious digestive upset, Mead's Oleum Percomorphum is an antiricketic agent of choice. (2) In Florida, Arizona and New Mexico, where an unusually high percentage of sunshine prevails at all seasons, Mead's Oleum Percomorphum continues increasingly in demand, as physicians realize that sunshine alone does not always prevent or cure rickets. For literature, write to Mead Johnson & Company, Evansville, Indiana.

New Publications Concerning Venereal Diseases.—*Social Hygiene Nursing Techniques,* Nadine B. Geitz, R. N. Just off the press and just what every nurse and social worker needs. Pp. 84. Single copies, 30 cents postpaid. See the April *Journal of Social Hygiene* for text in full. *Syphilis—Its Cause—Its Spread—Its Cure,* published by the United States Public Health Service. Six-page leaflet, photographic illustrations. $1.00 per 100. Order directly from the U. S. P. H. S., Washington, D. C. *The A-B-C of Syphilis.* Facts about syphilis and gonorrhea told in brief statements, catchily phrased, and arranged in alphabetic order. Reprinted in a handy pocket edition by permission of the New Jersey State Department of Health. Attractively illustrated and reasonably priced. Single copies, 5c; 50 cents per dozen; $2.50 per 100.

It is becoming more and more important that the physician regard his patient as a social unit and not simply as a case of tuberculosis or cancer. Every patient is an integral part of society, an important biologic unit, a part of a greater whole, one piece in a larger design and no doctor is discharging his full obligation to either the patient or to society who is not fully aware of the social factors which predispose to disease. Conditions, in this respect, were not as bad seventy-five years ago as they are today. Then, the family physician was far more familiar with the social side of his patient's illness than the modern busy practitioner of today with an office practice, seeing twenty or more people within a few hours. He has no time to familiarize himself with the social and economic factors which influence the disease process in nearly every case.

Smallpox in the United States.—According to the statistical bulletin of the Metropolitan Life Insurance Company, the year 1937 witnessed another rise in the incidence of smallpox throughout the greater part of the United States. Reports received during the year indicated 11,806 cases, as against 7,044 in 1936. Although the form of the disease now prevalent is mostly mild, the more deadly form might arise at any time. Indeed, such change in virulence has been noted in some epidemics. Curiously, smallpox is much more frequent in some of the less populous states, notably the eight northwestern states. The better situation existing in the more heavily populated eastern and seaboard states was not always as good as it is now. The communities in which smallpox is now so relatively common may suffer a serious epidemic before the unnecessary ravages of the disease are stopped. The number of cases reported and the continued trend upward are a direct reflection of the percentage of unvaccinated among the population.—*Journal of the American Medical Association*, July 2, 1938.

"The increase in 'nervous breakdowns' today is rarely due to 'overwork' but more often to 'over worry'. When chronic worry affects the appetite and sleepless nights follow, we must regard such symptoms as a warning of impending mental disease. On the other hand, enlightened self-interest demands that we worry. It is necessary to progress and achievement. Abraham Lincoln was a deeply furrowed and worried man. Nothing, indeed, worthwhile was ever accomplished without a great deal of worry. Certainly 'we should worry'—the interpretation of modern slang to the contrary, notwithstanding." — *The Health Officer.*

BOOK REVIEWS

Medical Writing: The Technic and the Art. By Morris Fishbein, M. D., Editor, *Journal of the American Medical Association*, and Jewel F. Whelan, Assistant to the Editor. Cloth. Pp. 212. American Medical Association, Chicago.

A handy volume likely to be of some interest to any member of the medical fraternity, this clearly presented treatise will appeal particularly to those who, from time to time, promote medical publication, whether in bookmaking or by contributions to periodical literature; representing, as it does, the gradual evolution of a pamphlet originally used as a standard by the press of the American Medical Association, then a more pretentious book called "The Art and Practice of Medical Writing," by the late George H. Simmons, M. D., for years editor *Journal A. M. A.*, and Dr. Morris Fishbein, editor of the *Journal of the American Medical Association*, and finally a revision of the previous work, with additional new material. What constitutes an acceptable paper for a medical magazine is discussed, and the matter of style, subject and material, construction of a manuscript, even words, phrases, spelling, capitalization, and proper and improper correcting after proofreading, are considered by experts of authority. Advice is also given as to the most effective preparation of charts and tables, and designs and engravings in general; and there is a supplement of abbreviations for periodicals recognized the world over, and so likely to be cited, necessarily with brevity, and—what is always so desirable—there is a practical index. The orthography approved of is that adopted for A. M. A. publications. Numerous illustrations make this admirable work of reference more serviceable; while a

THEELIN

(ketohydroxyestratriene)

The introduction of Theelin to the medical profession by Parke, Davis & Company marked a new phase in endocrine therapy. Theelin was the first estrogen to be isolated in pure crystalline form, the first pure estrogen to be used clinically, the first to be reported in medical literature.

Theelin has been available, either experimentally or commercially, for nearly eight years. During that time it has made endocrine history with thousands of discriminating practitioners who have relied on it for supplementing or replacing deficient ovarian secretion in the control of menopausal symptoms.

THEELIN (AQUEOUS) · THEELIN IN OIL · THEELIN SUPPOSITORIES

KAPSEALS

THEELOL

(trihydroxyestratriene)

Theelol is likewise a chemically pure, naturally occurring estrogen, carefully standardized by physiological and chemical methods. It is closely related to Theelin, but more soluble in water.

Theelin for intramuscular use, and Theelol for oral administration, were isolated and identified both chemically and pharmacologically by Dr. E. A. Doisy of St. Louis University. The further development of these two preparations for clinical application was carried out through cooperative work on the part of the staffs of the Research Laboratory and the Department of Experimental Medicine of Parke, Davis & Company.

handsome portrait of the late Dr. George H. Simmons (1852-1937), from a bronze relief at Association headquarters, properly adorns the volume.

J. B. Murphy: "The Stormy Petrel of Surgery." By Loyal Davis, M. D., M. S., Professor of Surgery, Northwestern University. Price $3. Obtainable through J. W. Stacey Book Company, San Francisco.

As one who knew Murphy, frequently saw him in his clinic or at medical meetings, this reviewer commends this book. Those who knew him will recall this character in American surgery. Others will be able to appreciate his career and personality.

Loyal Davis has presented the highlights of Murphy's life. By necessity, Davis was compelled to omit hundreds of instances, many dramatic, that might have been included in this tale of a surgeon who was admired and hated by thousands.

Read it. You'll enjoy it. Send to J. W. Stacey Company, Flood Building, San Francisco, for this narrative.

Prevention of Premature Senility. By Victor G. Vecki, M. D., San Francisco. Second edition, revised. With Foreword by Victor Robinson, M. D., Professor of History of Medicine, Temple University School of Medicine, Philadelphia. Paper. Pp. 126. New York: Froben Press, 1937.

The "ideal author" for such a volume of good advice regarding the prevention, if possible, of needless senility, according to Victor Robinson, Doctor Vecki is, himself, another victor, "his physical and mental vigor, on the threshold of eighty years, being quite remarkable." It is natural, therefore, that, as a leader in sexual science, the writings of the venerable San Franciscan should be characterized by virile straightforwardness; hence, what he has to say about the sexual life and marriage, as well as eating, drinking, smoking, constipation, obesity, exercise, work, sleep, and longevity will interest the supposedly informed man of medicine as well as the more groping layman.

TWENTY-FIVE YEARS AGO

(Continued from Text Page 176)

From an Original Article on "The Symptomatology of Gall Bladder Disease," by Herbert C. Moffitt, M.D., San Francisco.—In 1905 I had the pleasure of reading a paper before this Society upon the clinical features of gall bladder and gall duct disease. The mass of publication since that time has brought a few new facts and points of view, but no one feature has been as frequently emphasized through many papers as the importance of a careful history of the patient in establishing an early diagnosis of these affections. . . .

From an Original Article on "The Work of the Pasteur Division of the State Hygienic Laboratory," by J. C. Geiger, M.D., Berkeley.—In an article written in 1910, Black and Powers reported a small outbreak of rabies among dogs in Los Angeles in 1898. They also reported a fatal human case in Pasadena in 1899, and another outbreak of rabies among dogs in the Soldiers' Home near Los Angeles in 1906. In Stimson's report on rabies, published in 1910, California was declared to be one of the states that was free from the disease. In 1909 the present epidemic began to attract attention, and two articles by Sawyer show the spread of the disease up to April 1, 1912. The spread of rabies has been continuous and rapid throughout the state. The toll of human deaths has been 18, and the loss of valuable live stock has been considerable. Organized efforts have been made to check its progress, but the lack of coöperation on the part of the county officials, and a bitter opposition from other sources, have greatly retarded the work so far. The presence of rabies in any given community will cause considerable excitement and the passage of numerous laws, which in time are forgotten. . . .

From an Original Article on "Comments on Tuberculin," by Jno. C. King, M.D., Banning.—The program demands from me a paper on tuberculin tests. Such a paper

would be largely academic, mere quotations from so-called authorities. With your permission, I will, instead, endeavor to give a rambling talk on certain phases of tuberculin that have impressed me in my daily work. No man has any right to express an opinion upon a subject he has not investigated. My interest in this subject dates from Koch's first announcement, because I was then suffering from tuberculosis. Experience soon convinced me that tuberculin was too dangerous for me to use in general practice. For some years I wrote and spoke against it. About fifteen years ago I began to restudy it and to use it—cautiously. I have always been prejudiced against its use, but for a long series of years I have made from 7,000 to 10,000 injections annually. Regarding many points connected with it I have been unable to arrive at definite conclusions. Some few questions I have definitely settled in my own mind. . . .

From an Original Article on "The Intravenous Administration of Diphtheria Antitoxin" by Raymond Boileau Mixsell, A.B., M.D., Pasadena.—The administration of medication by way of the veins is not a recent invention. One of the earliest attempts at intravenous injection was made by Dr. Christopher Wren, Savilian Professor in the University of Oxford. His experiments consisted in the intravenous injection of cathartic substances, and were performed upon dogs during the year 1665. . . .

From an Original Article on "Carbohydrate Cures in Diabetes," by E. Schmoll, M.D., San Francisco.—A few years ago when Naunyn wrote his classical treatise on dia-

(Continued on Page 18)

BASIC OPERATIONS IN COMMERCIAL CANNING PROCEDURES

VI. COOLING THE TIN CONTAINER AFTER THERMAL PROCESSING

● On this page we have previously described certain basic operations in commercial canning procedures. These have included cleansing of the raw material; blanching; exhausting or pre-heating; sealing the tin container; and thermal processing of the sealed container. In this—the last of this series—we shall discuss the final basic operation, namely, the cooling of the sealed can immediately after the heat process.

One main reason for rapid and thorough cooling of the can contents—as soon as the objective of the heat treatment has been fulfilled—is more or less self-evident. Prompt cooling checks the action of the heat and thus prevents undue softening in texture or change in color of the food. Also important, particularly in the case of foods of an acid nature, is the prevention of excessive chemical action between the food and the metal container, which may occur if the contents of the can remain hot for an extended period of time. In modern practice, two types of cooling are commonly used, namely, air cooling and water cooling.

Air cooling, as the name implies, involves cooling of the tin container by facilitating radiation of its heat into the air. This type of cooling is adaptable to certain products in small cans. In other products, or in the case of larger cans, it is employed chiefly when the slower loss of heat, characteristic of this cooling method, is essential either for preservation of the food, or for the production of certain quality characteristics in the final product. Modern air cooling is accomplished in well ventilated, specially designed warehouses where the cans are piled in rows, allowing ample space between rows for efficient air circulation.

The several methods of water cooling and the technique by which they are carried out are detailed elsewhere (1). Briefly, water cooling may be effected in a variety of ways. The hot cans may be cooled by admitting water into the retort in which they were processed, or they may be cooled after removal from the retort by conveying the cans through tanks of cold, running water or through cold water showers. Large size, or irregularly shaped cans—processed under steam pressure—must be cooled in the closed retort at the end of the process to avoid undue strain on the containers. This is accomplished by "pressure cooling" in which pressure is maintained in the retort during the cooling of the cans, to counterbalance the pressure which develops during the process within the can itself. Commercially, cans are water-cooled to about 100°F. so that enough residual heat remains to dry the can exterior.

Present day canners are fully aware of the importance of cooling their products rapidly and completely as soon as the process is completed, in order to insure the production of canned foods with high quality characteristics. Consequently, in modern canneries the cooling operations are strictly supervised like the other basic operations in the commercial canning procedure. After inspection and labeling, the cooled cans are then ready to enter distribution channels for delivery to the consumer.

In this series of six discussions, we have attempted not only to describe the basic steps in commercial canning procedures, but also to explain their purposes. We trust this series may help bring a better understanding of this important method of food preservation.

betes, the treatment of this metabolic disturbance seemed to be established on a foundation equally supported by our theoretical conception of the nature of the disease, as well as by practical experience. I remember that, at that time discussing the pathology of glycosuria, Professor Alonzo Taylor and I agreed that it was the clearest chapter of the pathology of metabolism, and that the only point needing further investigation was the prevention of acidosis. . . .

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 176)

Andrew Lee Wallace, M.D., Los Angeles, cited on the basis of his conviction in connection with the ambulance chasing-insurance fraud cases, was found guilty and on June 28, 1938, he was placed on probation for a period of five years.

Richard Whittaker, M.D., Los Angeles, cited on the basis of conviction in connection with the ambulance chasing-insurance fraud cases, was found guilty and on June 28, 1938, he was placed on probation for a period of five years.

The cases of John F. Diddle, M. D., Oakland; Harold J. Hamilton, Drugless Practitioner, San Francisco; Phillip E. Gardner, Drugless Practitioner, Los Angeles; Arthur F. Gill, M. D., Banning; Isidore A. Wallach, M. D., Los Angeles; Edward Huntington Williams, M.D., Los Angeles, were dismissed.

The hearing of Henry L. Gardner, M.D., San Francisco, charged January 6, 1933, with aiding and abetting in connection with the Pacific Health Corporation, was continued to the next meeting of the Board.

The charge of alleged illegal operation against Milton S. McMurtry, M. D., Clovis, was continued to the next regular meeting because of an automobile accident to the complaining witness.

The hearing of Thomas D. Wyatt, M.D., Redding, on charges filed September 18, 1936, as well as citation issued October 19, 1937, was continued to the October meeting.

The hearing of William H. Young, M.D., against whom three citations have been issued, based upon his asserted connection with the Samaritan Treatment for Alcoholism, was delayed because of a Restraining Order issued by the San Francisco Superior Court, returnable July 7, 1938, i. e., a week after the Board meeting would close.

Petitions for restoration of license were granted in the following instances:

Frank T. Cary, M.D., revoked June 30, 1937, based on narcotic conviction, was restored June 27, 1938, and he was placed on probation for a period of five years, without narcotic privileges.

The certificate of Leo M. Schulman, M.D., revoked February 11, 1937, was on June 27, 1938, restored and he was placed on probation for a period of five years without narcotic privileges.

Francis White Steddom, M.D., whose certificate was revoked July 1, 1937, was restored June 30, 1938, and he was placed on probation for a period of five years, without narcotic privileges.

News

"Twenty-one alien physicians, most of them from Germany, were denied the privilege of practicing medicine in Texas by the State Board of Medical Examiners. The group included three from Mexico, one Japanese, and seventeen Germans." (Associated Press Dispatch, dated San Antonio, Texas, June 20, published San Francisco *Examiner*, June 21, 1938.)

"The United Provident Association, an Oakland group organized to furnish medical and surgical care to its members, filed articles of incorporation with Secretary of State Frank C. Jordan." (Sacramento *Bee*, June 11, 1938.)

July 20, 1938

Effective this date we have made a reduction of $2.50 a day in rental charges for Oxygen Tents, including Oxygen used.

These reductions are made in the belief that the benefits of Oxygen Therapy should be available to more people. The field is rapidly widening. More than half the tents we now supply are for cardiac trouble. There is an increasing use of Helium-Oxygen mixtures for asthma, and the price of these mixtures has recently been reduced as much as 50%.

We are the largest independent manufacturer of Oxygen in California, supplying it and the approved equipment to use it from our four establishments: San Francisco, Los Angeles, Oakland and Fresno. Trained men answer your call twenty-four hours of every day. They install and check the equipment and give your nurses the necessary simple mechanical instructions.

Our constant effort is to assist the medical profession through dependable, speedy service and costs as low as possible, consistent with its emergency character.

BOARD OF MEDICAL EXAMINERS

(Continued from Page 19)

"A new position as President of the recently organized Medico-Legal Association will take Dr. Frederick C. Warnshuis, former Secretary of the California Medical Association, from San Francisco today. . . . His main job will be to coördinate medico-legal practices throughout the nation. His headquarters will be in Boston." (San Francisco *Examiner*, July 7, 1938.)

"A plan prepared by Harry B. Riley, State Controller, to deduct payments for health insurance from state employees' pay checks, was frowned upon today by U. S. Webb, Attorney General, who stated that Riley has no authority to inaugurate such a system. Riley, at the urging of John J. Hamlin, Attorney for the California State Employees' Association, had expressed willingness to set up such a system for voluntary deduction; however, Webb emphasized that at the last session of the Legislature the bill authorizing such a system had failed to pass." (San Francisco *Call-Bulletin*, June 15, 1938.)

"Smashing an alleged scheme to import white dancing girls to Oakland for the entertainment of Filipinos, police today held one man in jail and planned to question three young women, following a raid last night. . . . They arrested Ralph P. Iturralde, age thirty-four, who gave his address as the 'University of California.' . . . Later, after interviewing his white wife at 169 Eleventh Street, Oakland, they held Iturralde for investigation for the State Board of Medical Examiners. Iturralde, police asserted, was reported to have practiced medicine in Oakland without a

license. He is a Works Progress Administration worker, police said, on a project at the University . . ." (Oakland *Post-Inquirer,* June 13, 1938.)

"Edward P. Fewer, fugitive Dean of a Polk Street Chiropractic school and clinic, returned to San Francisco from Texas yesterday as an extradited prisoner. Arrested last month with Mortimer E. Timm, Densmore Henschell, and Dan C. Lindsey, Fewer was charged by agents of the State Board of Medical Examiners, of conspiracy to violate provisions of the Business and Professions Code, through illegal performance of surgery." (San Francisco *Examiner,* June 16, 1938.)

"With surrender of Dr. E. E. Stone, well-known Los Angeles physician, on a secret indictment returned Wednesday, immigration agents said yesterday they had broken up a ring which had schemed to defeat the immigration laws. The indictment charged Doctor Stone and Dr. E. Hughes, his associate, had prepared false affidavits which represented that Franz Todin and Jeronim Movar, Jugo-Slavian aliens, had property interests in this country and would not become public charges. To substantiate these claims a series of fraudulent transfers of property were made by the other defendants, the indictment charged. . . . Immigration officers indicated others were involved in the plot, including two attorneys, and that more arrests would follow." (Los Angeles *Daily News,* June 17, 1938.)

"Governor Merriam today announced the following appointments to the Board of Osteopathic Examiners:

Lester R. Daniels, Sacramento, for the term ending December 31, 1938; Edward Grant Jones, Los Angeles, 1940; Warren R. Davis, Long Beach, 1940; and Ernest G. Bashor, Los Angeles, 1939." (Press Dispatch, dated Sacramento, June 18, printed San Francisco *News,* June 18, 1938.)

"The resignation of Dr. O. H. Perry as Resident Physician of the Sutter County Hospital, is in the hands of the Board of Supervisors. It is believed the resignation may end the long controversy over the management of that institution. . . . The resignation was accepted and will become effective July 1 if the supervisors are able, by that time, to select his successor. . . ." (Sacramento *Bee,* June 24, 1938.)

"The appeals of two convicted abortionists were taken under advisement following oral argument yesterday before

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

IN CONCENTRATED FEEDING

It's Caloric Intake

PROPERTIES OF KARO

Uniform composition
Well tolerated
Readily digested
Non-fermentable
Chemically dependable
Bacteriologically safe
Hypo-allergenic
Economical

•

COMPOSITION OF KARO

(Dry Basis)

Dextrin	50%
Maltose	23.2%
Dextrose	16%
Sucrose	6%
Invert sugar	4%
Minerals	0.8%

•

KARO EQUIVALENTS

1 oz. vol.	40 grams 120 cals.
1 oz. wt.	28 grams 90 cals.
1 teaspoon	15 cals.
1 tablespoon	60 cals.

Concentrated feeding is indicated in certain digestive and nutritional disturbances. The quantity of feeding given at one time is reduced and the caloric intake maintained by concentrated mixtures. Karo added to dried or evaporated milk is particularly adapted for concentrated feedings.

But other articles of diet can be enriched with calories—Karo provides 60 calories per tablespoon. It is relished added to milk, fruit, vegetables, cereals, breads, desserts. Karo is a concentrated carbohydrate that makes food more palatable.

Infant feeding practice is primarily the concern of the physician, therefore, Karo for infant feeding is advertised to the Medical Profession exclusively.

FREE *to Physicians only:*

Convenient Calculator of Infant Feeding Formulas; accurate, instructive, helpful. On receipt of Physician's prescription blank, giving name and address, the Calculator will be forwarded. Write Corn Products Sales Co., Dept. SJ 8, 17 Battery Place, New York, N. Y.

WE KNOW YOU'LL WONDER AT THIS STATEMENT, DOCTOR

Ralston Wheat Cereal

When you think of expensive, complicated vitamin concentrates it's difficult, we know, to believe this simple statement. Yet Ralston Wheat Cereal *does* cost less than 1¢ for a generous bowlful—and that same bowlful provides 2½ times as much vitamin B as a similar serving of natural whole wheat.

That's because Ralston Wheat Cereal is fine, full-flavored wheat—enriched with sufficient quantities of pure wheat germ to make it 2½ times richer in this precious vitamin B which does so much to keep appetite and digestion normal. (Each gram of Ralston contains 1½ International units of vitamin B.)

In addition, Ralston is completely cooked and readily digested after 5 minutes over an open flame. Research Laboratory Report and samples of Ralston Wheat Cereal will be sent to you on request. Use the coupon.

RALSTON WHEAT CEREAL

the State District Court of Appeal. Reversals of the lower court judgments were asked by Dr. Claude C. Long, found guilty of manslaughter, and Max Hickok (Chiropractor), convicted of second degree murder." (San Francisco *Examiner*, June 28, 1938.)

"Termination of a county jail sentence for Dr. Louis Kameny, convicted of conspiracy to commit grand theft, was granted today by Superior Judge Lincoln S. Church. Judge Church freed Kameny, Oakland doctor, so that he might defend himself against an action to revoke his physician's license by the State Board of Medical Examiners early in July. He was freed July 1 but must report to probation officers until December, 1940. Doctor Kameny was convicted last December after an attempt to collect fraudulent insurance for injuries suffered in a beauty parlor accident by Mrs. Adrienne Udstone. He was sentenced to a year's jail term. Emil Grossman, Oakland, is serving one to ten years' sentence in San Quentin for the same charge. Mrs. Udstone was acquitted." (Oakland *Post-Enquirer*, June 28, 1938.)

"W. M. Lukasky, Anaheim masseur, stood accused today of victimizing an almost blind nineteen year old Long Beach girl by telling her he could prevent her blindness by massage. Lukasky and three women assistants were arrested by W. N. Anderson, Special Agent for the State Board of Medical Examiners, and Constable Ed. Marion, arraigned in Anaheim Justice Court yesterday and their jury trial set for July 19. Lukasky was unsuccessfully prosecuted on a similar charge here two years ago and had been convicted previously in Long Beach after an appeal for a new trial. . . ." (Santa Ana *Journal*, June 17, 1938.)

"Lillian P. Parker, Long Beach nurse, yesterday was sentenced to serve nine months in the county jail and was given five years' probation by Superior Judge W. Turney Fox, who convicted her last June 10 of performing an illegal operation. Judge Fox, who heard the case without a jury in Long Beach on special assignment, gave Miss Parker five years' probation on condition that she serve nine months in jail, but he ruled she was entitled to a deduction of twenty days already served. During probation she shall not engage in or be connected with nursing or the medical profession." (Los Angeles *Daily News*, June 20, 1938.)

"In the San Francisco Hospital yesterday lay twenty year old Mrs. Margaret Babbino. In the Babbino apartment at No. 6 Harwood Alley, on the slope of Telegraph Hill, sat her worried twenty-one year old husband, Robert, a WPA worker. In the hospital Mrs. Babbino fought death brought close by a clumsily performed illegal operation six days ago. On June 25 an operation was performed. A few days later Mrs. Babbino developed a fever and was taken to the hospital suffering from an infection." (San Francisco *Chronicle*, July 2, 1938.)

"Laboratory Made" Vitamin E Brings Rat Fertility. —For the first time in medical or biologic history a living creature rendered sterile through the absence of vitamin E, discovered in the University of California sixteen years ago, has been made fertile through dosages with the synthetic vitamin in minute portions (three milligrams). Sterile rats of both sexes in the laboratory of Dr. Herbert M. Evans, director of the University's Institute of Experimental Biology, and discoverer of the vitamin, were given the substance in synthetic form developed from coal tar by Professor Lee Irvin Smith and his associates in the Uni-

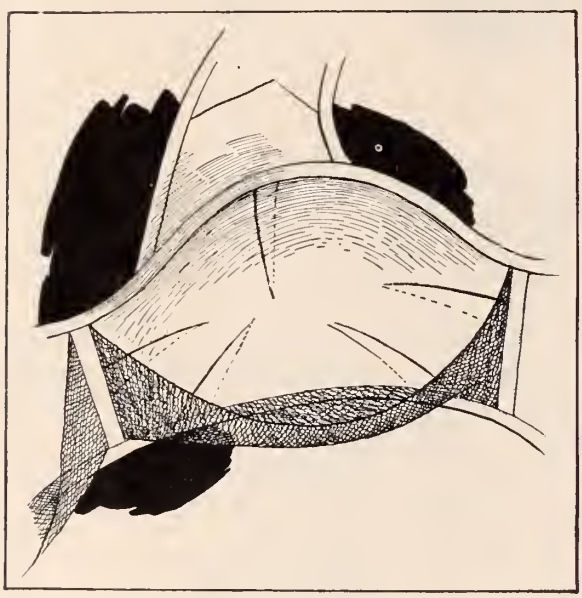
BREAST SUPPORTS

An author* in the current medical literature, after reviewing the histories of 518 patients with carcinoma of the breast, gives the following practical suggestions which might prevent the development of precancerous lesions.

"1. More careful history-taking with an accurate analysis of the history . . .



2. Education of mothers as to the necessity of nursing their babies . . .

3. If for any real reason the mothers are not able to nurse their babies, insistence on the use of a breast pump (preferably an electric one) . . .

4. More careful attention to the care of the nipples.

5. Correction of pelvic disorders especially when there is any pain in either breast during the menstrual periods.

6. More consideration to the proper support of the breast at all times."

Detail of pocket in bust compartment of opposite photograph (as seen from inside).

Support for heavy, pendulous and extremely pendulous breast.

The bust compartment of the Camp Breast Support (illustrated) is designed with an extra, inside, well-fashioned piece of material forming, with the outer fabric, a pocket into which the breast fits. Reinforcing pieces of fabric come from under the arm, circle around under the breast, serving as a shelf for support, and are attached to the opposite shoulder strap; these shoulder straps are provided with an elastic insert.

(Continued from Page 27)

versity of Minnesota. Fertility of the rats resulted from the synthetic product, the same as it had resulted from the empirical product produced by Doctor Evans and his staff.

While Doctor Evans will make no prognostication of the results of this discovery on the fertility or infertility of the human race, he regards it as the climax of an era of vitamin E experimentation— an era so successful that it is to be detailed by Doctor Evans to the leading physiologists of the world, gathered in the International Physiological Congress in Zurich, Switzerland, August 14–18.

Not only does the discovery place substantial portions of the vitamin in the hands of scientists at a greatly reduced cost, for both human and animal experimentation, but it sweeps aside many of the baffling difficulties that stood in the way of obtaining the vitamin in its pure form. It now provides a base of experimentation far more easy of application than that which accompanied the development of the vitamin to its crystalline form (tocopherol) from natural sources such as wheat germ oil, cottonseed oil, lettuce leaf oil, palm oil, etc.

"This closes an important era in vitamin E research, for it established its structural as well as its empirical formula," Doctor Evans said. "Certain details of the spacial configurations of the molecule will probably have to be settled by different types of syntheses, which are being attempted by Professor Smith and other chemists."

The production of fertility in rats from a vitamin "manufactured in a laboratory," comes as the major development to date on a discovery that has engaged world wide attention from the start.

Cyclotron Product Throws New Light on Deadly Disease.—Experiments conducted with the treatment of leukemia in white mice by use of radio-active phosphorus manufactured in the world-famous atom-smashing cyclotron at the University of California have revealed some new information about one of the world's deadliest diseases.

THE POTTENGER SANATORIUM AND CLINIC
For Diseases of the Chest *Monrovia, California*
AN INSTITUTION FOR DIAGNOSIS AND THERAPY

CHOICE rooms and bungalows at rates ranging from $35 per week up, including medical service, general nursing, x-rays, routine laboratory examinations, ordinary medicines and therapeutic pneumothorax.

A few accommodations as low as $25 per week assigned on special application in selected cases.

In the foothills of the Sierra Madre Mountains, thirty-five miles from the ocean. Surrounded by beautiful gardens.

Close medical supervision. Aside from tuberculosis, special attention is given to asthma, bronchiectasis, lung abscess and kindred diseases.

For particulars address:

THE POTTENGER SANATORIUM AND CLINIC, Monrovia, California

Dr. John H. Lawrence, assistant professor of medicine, told members of the American Medical Association in San Francisco recently, that tissues, such as those of the bones, liver, and spleen, in which the leukemia cells concentrate absorb a much higher percentage of the radio-active phosphorus than do normal cells. Furthermore, the amount of phosphorus absorbed by diseased tissue is proportional to the degree of leukemia present.

To support his conclusion he showed the results of experiments conducted with the aid of K. G. Scott, graduate student in chemistry, in the new Radiation Laboratory on the Berkeley campus. Normal mice and mice which had leukemia were both given radio-active phosphorus, either by injection or by introduction into the body through a stomach tube.

In the first group of mice on which experiments were conducted five had received an injection containing 8,220,000 leukemia cells. Two of the animals designated as Group A, showed very large spleens, lymph glands, and livers, which indicated advanced cases of leukemia. Group B, containing three mice, showed no signs of gross leukemia, but microscopic study revealed presence of leukemia cells in the livers, kidneys, and spleens. The third group, Group C, were the control animals and showed no signs of leukemia.

Group A retained 80.4 per cent of the total dose of radio-active phosphorus, Group B 76 per cent, and Group C only 53.4 per cent. Thus, the animals with leukemia retained about one and one-half times as much of the phosphorus administered as did the normal mice. The liver, spleens, and lymph glands of the leukemia animals contained from two and one-half to eight times as much of the radio-active element as did normal tissue.

Experiments carried on with two other groups of mice showed similar results.

The mice used in these experiments belonged to the so-called Strong A strain which is known throughout the world and is widely used by research workers. Only recently has it been possible to produce leukemia, which is an overgrowth of the white blood cells, into this strain. At present no successful treatment for leukemia is known. However, the disease in mice is very similar to that in man and, by using mice from the Strong A strain, studies of the cause of the disease and its treatment can be carried on in the laboratory with ease.

The selective concentration of radio-active phosphorus in the lymph glands, spleens, livers, and bones of leukemia-stricken mice affords a possible method of therapeutic irradiation in treating the disease in these animals. It is possible that the continuation of such experiments may, in time, lead to a treatment which may be tried on human subjects.

"NATIONAL HEALTH CONFERENCE"

Interdepartmental Committee.—Among other by-results of the Social Security Act, a provision was enacted in 1935 for an Interdepartmental Committee, consisting of the assistant secretaries of the United States Treasury, Departments of the Interior, Agriculture and Labor, and the chairman of the Social Security Board. One of the early acts of the Interdepartmental Committee was to call a "National Health Conference," to which were invited representatives of the medical profession, allied groups and the public, to discuss public health and related problems, and to formulate principles and recommendations pertaining thereto.

* * *

Eight Hundred and Fifty Million Dollars, the Estimated Need.—Without going into detail, it suffices to state that this Presidential Committee—for that is the name given by the press to the National Health Conference endeavor—convened in Washington on July 17, and promptly recommended, as necessary for a national public health program, so massive a yearly sum as $850,000,000 (eight hundred and fifty million dollars); half the amount to be allocated from federal sources, the other half to be supplied by state, county and local governments. According to this recommendation, the money so appropriated was to be utilized not only for general public health work as part of an extensive program, but in part, also, for medical care and hospitalization of needy citizens. It does not necessitate prolonged study or thought by physicians who have studied such experiments to make apparent the conclusion that such a program, if carried out, would, of course, soon drift into the sea of state medicine!

* * *

Opinions of President Roosevelt and Others. That the program outlined had the sponsorship of President Franklin D. Roosevelt may be inferred from his statement to the Conference that "millions of citizens lack the individual means to pay for adequate medical care," and that a "coördinated national program of action" was imperative.

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

Dr. Irvin Abell, president of the American Medical Association, at once called attention to the dangers of such a program, and the difficulties that must be encountered in devising a governmental plan adapted to widely different sections of the country. Dr. Hugh Cabot of the Mayo Clinic, on the other hand, in his espoused report, criticized the American Medical Association for not meeting its responsibilities. Similar statements were given by Mr. Lee Pressman, legal counsel for the CIO, who felt that the plan proposed should be kept "free of control by the heirachy of medicine." Dr. Olin West, secretary of the American Medical Association, on the contrary, again emphasized the risks inherent in medical practice if that were to be under the domination of political forces such as exist in the United States, and Dr. Morris Fishbein, editor of the *Journal of the American Medical Association*, suggested that first efforts to alleviate human morbidity might better be directed in support of work that would do away with underlying poverty and deplorable social welfare conditions clearly causative factors in creating illnesses that might otherwise have been prevented.

* * *

California's Experience.—California is fortunate in that methods to overcome whatever deficiencies may exist are being tried out along constructive lines in Alameda and other counties. It will be of interest, therefore, to note what new federal and state legislation, if any, this recent "National Health Conference" will, after its labors, induce.

PASSING OF JOSEPH P. WIDNEY, FOUNDER OF THE LOS ANGELES COUNTY MEDICAL ASSOCIATION

To have lived to the ripe old age of 97, with a mind keen and alert up to its last hours, despite such physical handicaps as a frail body and practical blindness, is an experience that has not often come to human beings. Yet such was the life* of Dr. Joseph Pomeroy Widney, whose death took place at Los Angeles on July 4, 1938.

Doctor Widney, it will be recalled, was the motivating spirit in the founders group which organized the Los Angeles County Medical Association on January 31, 1871, some sixty-seven years ago, and he—who in recent years was the oldest living graduate of the University of California (having received his M. D. degree from Toland Medical College in 1866)—also founded the College of Medicine of the University of Southern California in the year 1885. Later, in the financial panic of the nineties, he resigned as dean of the University of Southern California Medical Department in order to take over the responsibility of saving the University of Southern California at a time when its properties were about to be levied on by the courts; guaranteeing with his personal resources as he assumed the presidency the payment of the claims pending against the institution.

Born in Ohio in 1841, so far back that he recalled a childhood amid the wigwams of Indians, a soldier in the War Between the States and an assistant surgeon in Indian campaigns in Arizona, while successful as a physician in private practice in Los Angeles, he became the founder of a county medical society that is today one of the largest in the United States. He was also founder and dean of a medical school, and president and protector and saviour of the University of Southern California in its early days of life and death struggle. As a civic worker he had a broad and far-seeing vision of railroad, harbor and other developments, on a massive scale, for the southern section of California. Also minister of the gospel, and founder of a settlement house, and devotee of the gospel work, author of volumes of historical and other essays,† including a large two-volume "Race Life of the Aryan Peoples," he proved himself a kindly philosopher, with a mind richly stored with knowledge of the past, and ever alert and inquiring as to the significance of current changes and events. Dr. Joseph Pomeroy Widney's life was indeed such as is granted to but few men to enjoy.

And so, once more, a great man has been gathered to his fathers.

The following two essays, "Why Is Death?" and "Heaven," both written by Doctor Widney a few days before his death, are here printed as an *In Memoriam* to a beloved physician, whose name the California Medical Association may well place on its honor roll, and for all time to come:

WHY IS DEATH?*

Across the pathway of life, and apparently bringing it to an end, is Death, and from the earliest antiquity men have been asking the question, "Why death at all?" "Does it serve any useful purpose in the Drama of Life?" The answer is Yes, without death the drama of life would be a failure. The purpose of that drama is—The Making of a Man: not simply for time, but for eternity. That making is what has been called Evolution. Through all the years of his life man has been growing. It is the law of evolution, that is, of growth. The planet grows. It is first a gaseous nebula. It then becomes a habitable world. The man's body through which he works is a necessary attendant upon that life. A man may will that a brick shall place itself at a certain point in a wall which he is building—it does not obey. But he may will that hand to take that brick and put it into its proper place. It is matter acting upon matter through the use of matter. It is so in all phenomena of life. The subtle and intangible will of the spirit has acted upon matter. But, in this circuitous way, man realizes that he is hampered and restricted in his work.

Man is restricted in his knowledge of the world about him. He had thought that the seven prismatic colors were all. By using the chemical paper, he now knows there is an infra-red and an ultra-violet which he does not see. It is so in every department of human inquiry. It is so in the pitch, in the low and the high notes in music, and it is so in all the broad field of strange, intangible rays of power and light that come to us from the universe about us.

Shall man be stopped in his intellectual evolution by the limited range of the possibilities of further investigations in

* Biographical sketches of the late Dr. Joseph Pomeroy Widney appeared in CALIFORNIA AND WESTERN MEDICINE in the following issues: Vol. 44, No. 4, April, 1936, page 292; Vol. 44, No. 5, May, 1936, page 396; Vol. 46, No. 6, June, 1937, page 398.

† Doctor Widney was the author of the following volumes: "Race Life of the Aryan Peoples," "The Lure of the Land," "Three Americas," "A Greater Los Angeles," "A New Europe," "A New Orient," "Studies of Other Worlds."

* This essay was dictated by Dr. Joseph P. Widney on June 29, 1938, his death occurring five days later, on July 4, 1938.

the universe about him, because of the material limitations of the body through which, in this life, he must work? There is no escape from these limitations unless he is released from the body which defines them. This is why Death! Death is simply *release* that men may go on.

This is what every religion tries to explain. Man set free from the shackles that impede his progress that he may go on. It is not a calamity. It is a blessing in disguise. It is like the blessing of toil placed upon primitive man that he might work and progress.

The idle man in Paradise had failed. The man who went out from Eden to toil with the briars and brambles of a fertile earth that he might have food succeeded.

But the time comes when a man, even with all his achievements, reaches the limit. He can go no farther in a lifetime. Is his progress to cease? Death in this life has answered the question. Death is not a calamity! Man may still go on; Death may be the sum total of his experiences. It is the greatest blessing to man that God has made. Die—and go on!

Is this death to be all or does Eternity hold other deaths yet to come?

We deem that this life is not all, but is only one stage in the evolution of man upon earth. Eternal life upon this planet is withheld from man. The story is thus told in Genesis III, Verses 22, 23, 24.

(22) "And the Lord God said, Behold, the man is become as one of us, to know good and evil: and now, lest he put forth his hand and take also of the tree of life, and eat, and live forever:

(23) "Therefore the Lord God sent him forth from the garden of Eden, to till the ground from whence he was taken.

(24) "So he drove out the man: and he placed at the East of the Garden of Eden Cherubim, and a flaming sword which turned every way, to guard the way of the tree of life."

Eternal life upon earth—do we realize what it would mean? The body grows old—it has worn out its material envelope. Age, and a life properly lived, brings with it maturity. After maturity there follows decay.

* * *

HEAVEN†

Heaven—What is it?—When?—Where?

What conclusion must we draw from the many beliefs of the ancient and modern writers? Only one conclusion will be possible, that we are mistaken utterly in the meaning of the word Heaven. Everywhere in the Universe we find the law of eternal growth and eternal deterioration. It seems to be the same in every department of the Universe—material, intellectual, and spiritual. The pleasures of heaven lie in the thought:

I, too, am a sharer in the development of the worlds about me, a sharer with God, therefore forever sharing in the mind of the Supreme Maker of the Law. Was this not the deeper meaning of the word spoken by the Supreme Ruler—when discussing the future of man upon earth, *"He will become as one of us—knowing good and evil"?* The thought is, if in this lower sphere man should eat of the tree of life and live and gain eternal life, would it be death to his soul?

Life as we know it upon this plane is to be lived by successive births and consequent deaths; the soul progressing and developing in accordance with the fixed and unchanging law spoken in the beginning.

† This essay, dictated on the succeeding day, June 30, 1938, was given to his secretary, with the words, "This is my last chapter."

ROENTGENOLOGY, PATHOLOGY AND ANESTHESIOLOGY IN HOSPITALS

Growth of the Hospital System in the United States.—Problems in policy that are not vexatious are usually easily solved. By contrast, an example of a vexatious proposition, presented during the last few years at each annual session of the American Medical Association, is that dealing with the status of physicians specializing in pathology, roentgenology and anesthesia, and relating to their work in hospitals. The confusion has arisen because, in part, the standardization rules for hospitals, as laid down within the last decade or so by both the Council on Medical Education and Hospitals of the American Medical Association and the American College of Surgeons, have not only stressed the importance of hospitals maintaining high standards in these three specialties, but have practically denied to institutions not properly staffed therein places on the lists of Accredited and Approved Hospitals. That fact, with the trend within the medical profession itself not only to utilize hospital facilities for patients for a larger number of diseases and surgical conditions than in prior periods, but to send patients to the institutions almost at the onset of certain medical or surgical conditions, has resulted in the education of the public and their understanding that patients undergoing hospitalization should have the right to expect a high type of roentgenologic, pathologic and anesthesia service as part of routine hospital régime. It is not to be wondered at, therefore, that surface differences of opinion between some hospital administrators and physicians devoting themselves to the above specialties should have arisen.

* * *

The Ten Principles Enunciated by the American Medical Association.—At the 1934 American Medical Association annual session, its House of Delegates enunciated ten principles that have been generally accepted by the constituent state medical associations. This year, at San Francisco, additional representations on the subject were made by delegates from California, Massachusetts and other states, and by action duly taken. Paragraph 4 of these ten pronouncements was amplified by the addition of the following clarifying statement:

"If for any reason it is found desirable or necessary to include special medical services such as anesthesia, radiology, pathology or medical services provided by out-patient departments, these services may be included only on the condition that specified cash payments be made by the hospitalization organization directly to the subscribers for the cost of the services."

* * *

California Medical Association Is in Accord. The action so taken at the recent June session of the American Medical Association is in line with similar motions previously adopted by the constituted authorities of the California Medical Association. The attention of hospitals, and of hospitalization groups, and of physicians generally is directed to this amplification of the ten American Medical Association principles as a rule for their guidance. Back of all the discussion are two important facts: first, that roentgenologists, pathologists and anesthetists are members of the medical profession, with all the rights and privileges possessed by their fellow physicians in general practice or other specialties; and, secondly, that no corporation shall practice medicine, this latter rule

meaning, in law, that none other than a graduate physician, duly licensed, shall have the legal right to practice medicine. When these two principles are kept inviolate, there can be little basis for difference of opinion.

CONCERNING LEGAL RIGHT FOR COUNTY HOSPITAL CHARGES

Recent County Hospital Articles in the Official Journal.—CALIFORNIA AND WESTERN MEDICINE, for several months past, has printed a number of articles concerning bills for hospitalization services rendered to supposedly indigent patients who had been admitted to county hospitals for treatment. The legal right of county boards of supervisors, under certain conditions, to make such charges was questioned. A perusal of the articles referred to,* and particularly of several legal opinions therein, will indicate the lines along which exceptions were taken, particularly in relation to charges rendered to patients by the Los Angeles County General Hospital. However, the points of view to which expression was given by our friends in the legal profession in the comments referred to were not concurred in by the legal advisors of the Board of Supervisors (the County Counsel's Department of Los Angeles County); and, recently, a formal opinion was rendered by that County's Counsel in which it was stated practically that according to the law of California, county boards of supervisors have the legal right to charge all citizens for hospitalization at such rates as the supervisors may lay down, and without regard to whether the citizens receiving such care are indigents, near-indigents, or nonindigents.

* * *

Opinion of the Legal Counsel of the California Medical Association.—A copy of this County Counsel's opinion was sent to the legal counsel of the California Medical Association, Mr. Hartley Peart, with request for his informal judgment and his reply is printed on page 157 of this issue.

This later opinion is commended to the thoughtful perusal of members of the Association, and particularly to the members of county medical society committees on county hospitals. The issues involved are of great importance to California physicians, for the reason that enforcement of procedures recommended or sustained by the legal advisors to county boards of supervisors (especially if such opinions be in error) could result in great damage to public health interests and medical practice. It is to be remembered that boards of supervisors should abide by the opinions of their duly authorized legal advisors, because when public officials fail to follow the advice of their duly constituted legal advisors they do so at risk to themselves and their bondsmen. However, the mere fact that a county counsel, or one of his deputies, presents a legal opinion does not make such an opinion sound law.

One of the functions of courts is to decide what is and what is not the law: yet, until an official legal opinion is reversed in the courts, such an opinion is assumed to be the law. In the matter here referred to, one attorney, who happens to be a legal advisor of a board of supervisors, has rendered his opinion to such a board. In this issue will be found the opinion of another attorney—in this instance the legal advisor of the California Medical Association—who holds contrariwise to that of a county counsel. The points brought out by the legal counsel of the California Medical Association, Mr. Peart, are worthy of careful thought, and should be read by all physicians who are interested in the issues involved.

AN ILLUMINATING MAP

Adequacy and Inadequacy of Medical Care. During the last several years much has been written concerning "The Adequacy of Medical Care." When criticisms stressing the "Inadequacy" of Medical Care (as propounded by sociologic and other propagandists) are analyzed, it is often found that the seeming deficiencies in medical service, as they exist in the minds of writers of such articles, are based on what might be termed thought confusion, in that the critics demanded, among other idealistic provisions, as a fundamental requirement of adequacy, the existence of hospitalization and associated facilities for every part of the United States, paying little regard to such important matters as population and economic and sociologic conditions, and geographic and other environments.

Disparaging statements concerning the methods of present-day medical practice are not confined, however, to lay sources; because even within the profession a certain number of physicians seem to have been so carried off their feet in adulation of group and hospital practice that they also have become exponents, both orally and in writing, of similar thought-trends favorable to change in the practice of medicine.

* * *

The Map Is Worthy of Study.—This being unfortunately the case, a study of the black and white map, printed on pages 258 and 259 in the July 16, 1938, issue of the *Journal of the American Medical Association*, and showing the distribution of hospitals in the United States, is respectfully commended for all dissenters. The map shows that hospitalization facilities exist within thirty miles of places of residence of 98.5 per cent of the citizens of the United States! A distribution of hospitals such as that, in turn, necessarily means there is a supply of physicians in the districts sufficient to maintain such hospitals. Certainly when such figures are considered in relation to basic implications concerning facilities for medical care have we not a right to be surprised when we hear sociologic reformers and allied supporters prating about "inadequacy" of modern-day medical facilities? Readers who have not scanned the map referred to, and also the editorial comments as given on page 257 of the *Journal of the Ameri-*

* References referred to appear in a footnote in CALIFORNIA AND WESTERN MEDICINE, February, 1938, on page 74.

can Medical Association, should take time for such study, keeping in mind the topography and other conditions of the Great American Desert, the Western Plains and the Continental Divide, in which are located most of the sparsely hospitalized areas marked on the map by solid black.

"HUMANE DOG POUND" INITIATIVE WILL BE ON THE GENERAL ELECTION BALLOT ON NOVEMBER 8

The words, "Humane Dog Pound," as they will appear on the ballots for a proposed initiative law that will have a place at the general election on November 8 sound euphoneous to most ears, even though, as a matter of fact, the law, if enacted, when actually analyzed, will be found nothing else than another "antivivisection" measure.

Certain facts, therefore, should be kept in mind, to wit:

For a number of years, at annual and, later, at biennial sessions of the California Legislature, proposed laws have been submitted by the "Antivivisectionists," and in each recurring battle proponents of the measures have gone down to defeat.

The last engagement of forces is yet remembered by those who were "at the front," not forgetting the "battles of the blondes."

Presumably, from these previous experiences, the California proponents of such measures have come to the conclusion that it were best to try quite a different mode of attack. In this decision they are supposedly aided by "foundations," "bequests" and other extra-state sources; and, as a result, in this year, 1938, the voting citizens of California, on their November 8 general election ballots, will have brought to their direct attention, as one of the initiatives to be voted upon, the

"Humane Dog Pound Law!"

Elsewhere in this issue (on page 172) appear other comments on this subject. Members of the Association who are interested—and every member of the California Medical Association, without exception, has abundant right to be interested—should feel free to write for literature and other information to the California Society for the Promotion of Medical Research, 369 Pine Street, San Francisco.

That organization is bearing the brunt of the fight against this objectionable measure; in our opinion, so decidedly *inhumane* to both human beings and animals. And remember, also, that to promote the work of that organization—the California Society for the Promotion of Medical Research—it would be in order to apply for membership. Here is one place for action where it will be splendid to be a "joiner"!

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 154.

EDITORIAL COMMENT†

SURGICAL TREATMENT OF HYPERTENSION

Since 1923, when Danielopolu[1] first suggested the surgical resection of the splanchnic nerves for the reduction of heightened blood pressure, there have been a number of procedures advocated by various observers that might be justifiably applied in malignant hypertension, in view of the fact that the condition is inevitably fatal. Direct denervation of the suprarenal glands,[2] suprarenalectomy,[3] denervation of the kidney, and spinal-root resection,[4] have all been practiced with alleged symptomatic improvement.

The mechanism of the hypertensive state has always been one for speculation, and it is only recently that the various known physiologic facts connected with this condition have been ably assembled.[5] According to Weiss, it should be remembered that: (1) Vasomotor tonus in hypertension is normal and is superimposed on an intrinsic arteriolar spasm. (2) Arteriolar spasm is not due to an increased secretion of adrenalin nor is it neurogenic in origin. (3) The nature of the change in the arteries and arterioles is unknown. (4) The increased diastolic and systolic pressures are secondary manifestations, and may be looked upon only as a compensatory mechanism to preserve an adequate capillary circulation in the tissues.

It has been shown by Prinzmetal and Wilson[6] that the increased vascular resistance is not confined to the splanchnic area, but is generalized throughout the systemic circulation. Two other facts which also militate against a sympathetic origin of hypertension are: (1) Paralysis of the sympathetic ganglia by novocain infiltration produces no greater increase in blood flow in hypertensive than in normal individuals, as evidenced by sympathetic vasodilatation in an extremity, a test commonly used; and (2) it is well known that total exclusion of sympathetic control of the blood vessels in animals produces no lasting fall in blood pressure. These facts would seem to indicate no excessive activity of the sympathetic nervous system, which is the usual criterion for sympathectomy.

† This department of CALIFORNIA AND WESTERN MEDICINE presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

5 Weiss, Soma: Recent Advances in the Treatment of Hypertension, M. Clin. North America, 19:1343, 1936.

6 Prinzmetal, Byron, and Wilson, C.: The Nature of the Peripheral Resistance in Arterial Hypertension, with Special Reference to the Vasomotor System, J. Clin. Investigation, 15:63, 1936.

On the other hand, it is recognized that individuals suffering with hypertension show abnormal pressor responses to cold and emotion, and the work of Peet,[7] Heuer,[8] and Adson[9] has shown that sympathectomy may cause some reduction in blood pressure in certain favorable cases of malignant hypertension.

It is thus readily seen that the basis for surgical intervention is not particularly simple or easy to explain. Experience in the clinics, where series of patients have been carefully studied, does not indicate that a remission, much less a cure, may be encountered in any but a very small number of cases. It is more than likely that the beneficial effects reported are purely subjective accounts of the patients' reactions, since clinical tests have shown but mild and inconstant reduction in blood pressure, only slight increase in kidney function, and little or no ability to return to a useful occupation. As James White[10] has so well described the situation, "the whole matter of surgical intervention in severe hypertension is still so much in its infancy that it is impossible to form any final judgment about the surgical procedures described to date." Although investigation has to progress through justified and intelligent trial and error, it would seem reasonable at this time to expect further experimental work in the field of neurophysiology before any definite contribution to the treatment of essential hypertension is made.

ACQUIRED LESIONS OF THE TRICUSPID VALVE

The frequent presence of relative tricuspid insufficiency in advanced congestive cardiac failure is in striking contrast to the rare occurrence of organic disease of the tricuspid valve.

Relative tricuspid insufficiency is nearly always manifested by an increased pressure and systolic pulsations in the peripheral veins, the magnitude of such pulsations being considered an indication of the degree of valvular insufficiency. In many cases similar pulsations are demonstrable in the liver, which is enlarged under such circumstances. Systolic hepatic pulsations may be demonstrated either by direct palpation or with the aid of hepatic pulse tracings. One may or may not hear a systolic murmur localized over the lower sternum or xiphoid. If present, it is often indistinguishable from a similar murmur audible at the apex due to mitral insufficiency.

Relative incompetency of the tricuspid valve occurs so commonly with right ventricular dilatation in marked degrees of congestive failure that it receives little comment at the autopsy table. Nevertheless its presence, from the clinical point of view, is important as indicative of serious myocardial weakness and an overburdened right ventricle; in which instances considerable temporary relief may be given the patient by venesection.

Although relative tricuspid insufficiency may occur in myocardial failure due to many causes, organic tricuspid disease is most commonly the result of rheumatic endocarditis. In acquired tricuspid valvular lesions, insufficiency and stenosis are always coexistent to some extent, although the former is most frequently the predominant lesion. Organic tricuspid regurgitation is difficult to distinguish from a relative insufficiency, except that the latter and its peripheral manifestations may disappear with a return of improved myocardial function.

Acquired tricuspid stenosis rarely occurs unassociated with other valvular lesions. Its almost invariable association with mitral stenosis complicates its detection, so that it is rarely diagnosed antemortem. In fact, of the 252 cases of tricuspid stenosis reported in the world literature up to the present time, only thirty-two have been correctly diagnosed prior to autopsy. This should not discourage attempts to demonstrate its presence, if suspected, since, if present to a sufficient degree, it may produce signs and symptoms that are diagnostic.

Patients with tricuspid stenosis are practically always dyspneic on exertion. There is cyanosis of varying degree, often marked. The cervical and brachial veins are distended with presystolic pulsations or large "a" waves, demonstrable in the jugular pulse tracings. In some instances, combined inspection of the apex beat and jugular pulse may show the exaggerated wave to be synchronous with contraction of the auricles, even without the aid of instruments. The liver is usually markedly enlarged and tender, with auricular (presystolic) and ventricular (systolic) pulsations detectable either by palpation or with the aid of hepatic pulse tracings. Double hepatic pulsations may be explained on the basis of an hypertrophied right auricle contracting against an obstruction to the ejection of blood into the right ventricle, followed by a retrograde statis wave as a result of ventricular contraction. The most valuable and most significant clinical sign of tricuspid stenosis is the presence of auricular and ventricular pulsations in the liver. Upon the cessation of auricular activity during such arrhythmias as auricular arrest (sinus pauses), auricular fibrillation, nodal rhythm, or nodal tachycardia, the auricular pulse wave in the liver disappears, but the ventricular wave (systolic) persists.

Because the murmurs due to the frequently associated mitral stenosis are of greater amplitude, it may be impossible to detect auscultatory signs attributable to tricuspid stenosis. Nevertheless, in some instances it has been possible to demonstrate a diastolic or presystolic murmur over the xiphoid

end of the sternum differing in quality and sometimes, although not necessarily, in timing, from a similar murmur at the apical region due to associated mitral stenosis. Confirmatory evidence of such auscultatory findings may be secured with the aid of simultaneous electrocardiograms and electrophonocardiograms.

Finally, fluoroscopic studies may show enlargement of the heart to the right, with dilatation or hypertrophy of the right auricle and pulsations in the superior vena cava. Such findings would certainly be considered corroborative.

DIPHYLLOBOTHRIUM LARVAE IN TROUT OF CALIFORNIA WATERS*

Occurrence of different Diphyllobotriidæ has been recorded from various Eastern States of the Union. This communication deals with observations of Plerocercoids of this group in the boundaries of California. The first case concerns a privately owned lake in the Tahoe region, the second a lake in Lassen National Park. In both cases Eastern brook trout have been found afflicted. It is quite likely infections of trout by similar Plerocercoids may occur in other waters of California.

The infections were severe and often fatal to fish. Fingerlings, as well as trouts, weighing over a pound, have been killed off. The afflicted fish were less shy, swimming on or near the surface of the water before they died. There was generally no emaciation. Opened and placed in a dish of clear water, a varying and often great number of Plerocercoids could be seen emerging from the body cavity. Once liberated, the Diphyllobothrium larvae were swimming for some time with the alertness of leeches. The semitransparent body was elongated, ribbon-like, and slightly rounded on both ends. Placed in alcohol they assumed a saturated white color and a conical shape. Their size has been reduced by this procedure to about a third of the body length observed during life. Most of the larvae, however, remained embedded under or in between serous membranes of the intestines. Part of the Plerocercoids has been seen resting coiled in hairpin forms, others creeping extended and surrounded by large extravasates of blood. Some larvae appeared very minute, apparently having just passed the stage of the Procercoid. Highest numbers of parasites occurred regularly in the wall of the stomach, while decreasing numbers were found in the lower intestines, liver, kidney, and peritoneum. No larvae have been encountered under the skin or in deeper parts of the muscles of the body. This localization, as well as the more delicate shape of the body, makes a differentiation of these Plerocercoids from those of Diphyllobothrium latum possible. It is generally admitted that even adult stages of this group are sometimes difficult to classify. This is, of course, to a higher degree true in regard to larval stages. No proliferation of the Plerocercoids has been seen.

Fuhrmann[1] seems to believe that Diphyllobothrium larvae multiply by agamic proliferation, a fact which the writer has not been able to confirm in observations on his unusual large material of Diphyllobothrium latum collected in the Balticum. The writer, on the contrary, could demonstrate[2] that the increasing numbers of Plerocercoids found in larger predatory fish result from preying on smaller fish and on spawn, the latter being often infested with Plerocercoids. In other words, the more severe infections regularly observed in larger fish result from development of Procercoids after intake of primary hosts (Copepods) and, secondly, from ingestion of Plerocercoids (by preying on smaller fish and on spawn). Trout is a predatory fish, and it is quite likely the infections described above may have resulted from similar sources. This would especially explain the high incidence of Plerocercoids encountered in the wall of the stomach of these fishes. A big trout needs something more substantial as food, as there is a small copepod or a fly larva, especially if even this food is scarce by artificially filling up lakes with trout without due regard to food supply.

The species of Diphyllobothrium involved could not be established, because sickness necessitated a return to San Francisco. The studies will be continued during this year. The observations are certainly a problem for the State Fish and Game Commission, which is eager to provide a large and healthy trout population of lakes and streams. It may also be of some concern to health authorities because several species of Diphyllobothrium found in the United States of America thrive in animals as well as in man.

I do not know if it is not out of place to recommend to sportsmen working in medical fields not to throw intestines of fish in water or on shore, thus providing opportunities for spread of parasitic diseases, but to burn them. If anglers could be induced by these lines to make the test mentioned above for presence of Plerocercoids (to place the opened fish in a pan of water), this would not only enlarge our knowledge of regional distribution of these Diphyllobotriidæ in California, but it would possibly be to their personal benefit.

The Medical Center.

The required methods of work are no secret; for they have been employed by thinking individuals ever since the time of Socrates. Here one cannot build without laying foundations. One cannot, for example, be a radio expert without the principles of electricity. One cannot be a business expert without economics. One cannot be an engineer without getting a knowledge of mathematics. Thus it runs throughout the cycle of subjects. Successful work is a kind of development; so before going far one must master its preliminary and prerequisite stages. There is no other valid way. One cannot build a tower without first laying a solid foundation.

ANESTHESIA IN EUROPE*

By William LeRoy Garth, M.D.
San Diego

GENERALLY speaking, anesthesia in Europe lags considerably behind anesthesia in this country. But just as life over there is most interesting where most primitive, so anesthetic and surgical practices are to the greatest degree interesting perhaps, where they vary most from our own.

The first stop on my anesthesia tour of Europe was at Florence, Italy. There I had no introductions to surgeons or anesthetists, so inquired at my pension for the best surgeon in Florence. I was directed to a Doctor Storii, and went at once to see him. His offices were across from the Duomo, or Cathedral, in the heart of Florence, and occupied the entire ground floor of an old residence. This building had been palatial in aspect at one time, but now appeared somewhat dingy with age and long use. After waiting awhile, I was admitted to the consulting room, an enormous place, which fairly swallowed Doctor Storii and his nurse in its vastness. To my great disappointment, I found that Doctor Storii spoke no English; but fortunately his wife, a charming person who spoke English fluently, happened to be in the building and came to my rescue. It was soon arranged that I should watch the doctor work on the morrow.

The following morning I got up bright and early, but by the time I had managed to find some breakfast and get to the hospital, it was 8:30 and Doctor Storii had started operating at 8 o'clock. To my surprise I found that he was already operating on the third patient, two appendectomies having been completed. Presently, the fourth patient was sent for, and two orderlies came marching in with him in their arms, dumping him rather unceremoniously on the table. The anesthetist pounced on him at once, clamping the mask over his face and starting to pour ether, at the same time directing that the patient count, following his own count. After about five minutes the patient stopped counting, and the incision was made. Occasionally a patient moved or grunted when the incision was made, but, surprisingly enough, most of them seemed well enough anesthetized for the work at hand, which consisted of a series of appendectomies using the McBirney incision. Thinking it over afterward, I wondered if they were using a little ethyl chlorid or chloroform in addition to ether, but probably not, as I believe that I should have detected it by the odor. All over Europe, I noted that ether was dispensed in refillable bottles, instead of in the manufacturers' cans, as in this country.

Only 60 to 150 cubic centimeters of ether was used for these patients, partly because the operations were so short, averaging only twelve minutes, and partly because of the considerable degree of rebreathing practiced. The mask was covered with rubber, except for a small area about 2 or 3 centimeters in diameter, where the fresh ether was added. This rubber covering ballooned out more or less with each exhalation, thus acting as a sort of a rebreathing bag.

Another feature of Italian operating-room practice that interested me immensely was the cotton gloves worn by the entire surgical team. Doctor Storii, himself, had regular surgical gloves on under the cotton, but the assistant and the surgical nurse wore heavy elbow-length rubber gloves, such as are worn for dishwashing in this country. When I asked the reason for wearing the cotton gloves, one of the nurses, who spoke English, told me that it was because rubber gloves alone were considered too slippery. However, my guess is that they used cotton gloves before they had any rubber ones, and have never been weaned away from the cotton. In fact, one of the nurses, whose duty seemed to be the handling of reserve instruments, wore no rubber gloves at all, only cotton.

I found that in Italy most of the anesthetics at the large public hospitals are given by nurses and only a few by internes. In private practice they are all administered by physicians, usually by one of the surgeon's assistants, who alternately assists and gives anesthetics.

VIENNA

Finsterer's Clinic was my first objective in Vienna, since I was anxious to see a demonstration of splanchnic anesthesia. Finsterer uses the anterior approach, starting with a field block of the abdominal wall, then making a midline incision. His next step is gently to insert several long slender retractors, and a minimum amount of packing, so that a narrow channel is provided leading down to the region of the first lumbar vertebra. He then inserts a trocar, 25 centimeters long, which is tipped with a retractable needle, 2.5 centimeters in length, and makes the injection. About 20 cubic centimeters of 0.5 per cent procain is injected to the left of the body of the vertebra, and 70 cubic centimeters on the right. Almost immediately the patient relaxes in comfort and Doctor Finsterer proceeds with the operation. The patient's general condition remains surprisingly good throughout the long operation, and he shows signs of discomfort again only while the incision is being closed.

With modifications, then, such as the use of pentothal during the induction of the splanchnic block, it seems we might, perhaps, do well to follow Doctor Finsterer in our handling of this type of case. Using splanchnic anesthesia, Doctor Finsterer does extensive gastric resections with a mortality of only 4 per cent. Of course, this is not by any means due entirely to an improved anesthetic method. Doctor Finsterer's slow and careful work is that of an artist. He uses innumerable fine sutures, seemingly not pulled up at all snugly. Surprisingly enough, the aseptic technique at Doctor Finsterer's Clinic did not seem particularly good. The crowd of spectators were not required to wear caps, let alone masks, and the clean-up of the room between cases seemed cursory, to say the least. Here again, as in Italy, they wore cotton gloves over the rubber, perhaps with the idea of protecting and

*Chairman's Address, Anesthesiology Section of the California Medical Association, at the sixty-seventh annual session, Pasadena, May 9-12, 1938.

preserving the rubber gloves. The poverty of the country was reflected in the equipment, everything being old and dingy looking, probably most of it having been in use for the past twenty years or so, since the World War.

VIENNA—RUBOLS SPITAL

Eunarcon, an intravenous barbituric acid preparation, was being used at Werner's Clinic for most of the work. This drug seems to be somewhat slower in acting than are evipal and pentothal, so that one dose often sufficed for an operation lasting 20 to 30 minutes. This, of course, is a disadvantage from the standpoint of safety, since it makes for poor control of the patient, it being much easier to give a serious over-dose of the drug. A few case reports will illustrate this point.

The first patient, a middle-aged female, scheduled for a total hysterectomy, was given 4 cubic centimeters of eunarcon in one dose. She seemed well anesthetized for a few minutes; but Doctor Werner soon began to complain of the lack of relaxation, and supplementary ether had to be given. During the delay, Doctor Werner lost his disposition in German, and I got the impression that the anesthetist was getting the usual ribbing for not having provided the proper degree of anesthesia, with no delays. The patient became quite cyanotic, as anesthesia advanced, and seemed to need an airway, but none was used.

The second patient, a woman weighing only about 110 pounds, was given enough eunarcon in one dose to cause her to stop breathing very promptly. After a minute or so, chest pressure was applied a few times, and she resumed breathing spontaneously. The operation, a vaginal hysterectomy, was started immediately. The needle was left in the vein, and at the end of fifteen minutes another 2 cubic centimeters of eunarcon solution was injected, and the needle withdrawn. This seemed to be a precautionary measure, since the patient had as yet shown no signs of waking up. At the end of twenty-five minutes Doctor Werner completed the operation. A part of his technique was to split the uterus longitudinally in the course of removing it, and this in some way seemed to facilitate matters very greatly.

In Austria, the surgeon's assistants alternate as anesthetists. In private practice, I was informed, nitrous oxid is used frequently for minor operations, but the use of ethyl chlorid, followed by ether, is the standard method. At Finsterer's Clinic, for example, ether is used for a large portion of the work, the splanchnic anesthetic being reserved for the long, hard, gastro-intestinal procedures.

ZURICH, SWITZERLAND

At Zurich I had bad luck, in a way, since there was very little surgery to be done at the "Canton Spital" the day I arrived. Doctor Petri, the resident in surgery, spoke English fluently, however, which assured me of an interesting morning. He first showed me several gas machines of which he was quite proud. One of these was actually equipped with a built-in absorber, the only one I saw in Europe, outside of England. Then he rather shamefacedly admitted that most of the anesthetics in Switzerland are given by nurses. In fact, the lack of skilled medical anesthetists in Switzerland is such that they had recently had to send all the way to England for an anesthetist to give chloroform to one of the Maharajahs of India, who had refused to be operated on except with a chloroform anesthetic. Nitrous oxid is used frequently at the "Canton Spital," but no ethylene or cyclopropane is available. As a result, the gas must very often be supplemented by ether.

In their surgery, they use a sort of mitten made of cotton, over the rubber gloves. This left the thumb and fingers free, which did away with the argument in Italy that the cotton gloves were worn because the rubber is too slippery. The only function I could see for this type of glove was that it very neatly bridged the gap between the gown and the glove.

MUNICH, GERMANY

At the University Hospital in Munich all of the anesthetics were given by physicians; unfortunately, however, not by persons specializing in anesthesia. In fact, the only place in Europe where I found medical specialists in anesthesia was in England.

The first patient was given a high caudal block for an Alexander suspension. Seventy cubic centimeters of ¾ per cent tutocain was used, and the anesthesia obtained seemed entirely satisfactory. However, Doctor Mallow, the resident, admitted that they had about 10 per cent of failures to get such a high anesthetic effect with the method. One private patient was given nitrous oxid for a dilatation and curettage, but it was supplemented with ether, and the benefits of the gas were thus largely lost. The rest of the patients operated on that morning were given an ethyl chlorid induction, followed by a semiclosed ether anesthetic. Much more than the usual amount of rebreathing was provided for by a special mask, equipped with a rebreathing bag, and a tube for administering oxygen. The oxygen was measured by bubbling it through a flow bottle, filled with water. Through the good oxygenation thus provided, they seemed to get remarkable results with this simple apparatus.

An interesting thing about the surgical technique at Werner's Clinic was that the instruments were kept in pans of antiseptic solution instead of on instrument tables. After having been used, they were put back into the pans of solution, just as in this country they would be returned to the tray. It is interesting to speculate as to whether this custom might actually be a hold-over from the days of Listerian surgery.

HEIDELBERG

The next stop on my anesthesia tour of Europe was at Heidelberg. I was disappointed to find that Doctor Kirschner was away on his vacation, and that they had absolutely nothing scheduled, since they were only taking care of emergencies in his absence. I found that spinal percain was being used very extensively at Heidelberg for operations on the lower extremeties, and that narkogen, an intravenous barbituric acid prepara-

tion, was being applied increasingly for short operations of all kinds.

For laparotomies, avertin basal anesthesia, supplemented by ether, was the method of choice, but ethyl chlorid induction, followed by ether, was still being made use of for a considerable proportion of the work.

WIESBADEN—THE STADT KRANKENHAUS

Avertin is the anesthetic of choice at Kleinschmidt's Clinic. I saw only one operation there, an open reduction of a shoulder, for which 100 milligrams of avertin had been given. Anesthesia was incomplete, so it was supplemented by ether. When the patient's tongue dropped back, the anesthetist seized it with a grasping forceps, not even trying an airway first, which was understandable, as the airway provided was too short and straight to be of much use. When an instrument dropped on the floor, it was boiled only a minute or so, then cooled in an antiseptic solution and put back on the tray.

Doctor Kleinschmidt seemed badly spoiled by both nurses and assistants, who kowtowed to him in grand style. He bullied all of them in a pleasant manner, and, strangely enough, was very careless in the use of suture material, making no attempt to economize in its use. He seemed a real personage, and I was only sorry that my poor German and my lack of time kept me from getting to know him better.

PARIS—HÔTEL-DIEU

Ether, given by a semiclosed method, is the principal anesthetic used at Hôtel-Dieu. A mask, equipped with a sort of rebreathing bag, is used, and extensive rebreathing is practiced. The patients seemed quite blue; but since the operating room was fitted with blue glass windows, it was impossible to tell how much was due to cyanosis and how much was the reflection of the blue light. It did not occur to me at the time what a dangerous combination this was—the blue glass and the questionable anesthetic method. But, in thinking it over afterward, I came to the conclusion that most of the patients operated on there would probably do better with a great deal more oxygen than they were allowed to have.

The surgeons at Hôtel-Dieu wore the great, thick, elbow-length gloves seen at so many clinics in Europe; but in spite of this they seemed to get their work done promptly and efficiently.

Later in the morning I rushed over to the great Salpêtrière Hospital, but arrived too late to see any surgery. Upon inquiring, I was informed that ether is still the principal anesthetic agent used at the Salpêtrière.

LONDON

My first visit in London was to the old Westminster Hospital, across from Westminster Abbey. The hospital has the patina of age, appearing to belong to about the same period as the Abbey, further enlarged by the sixteenth century. Inside, however, it is fairly well modernized, and I found Doctor Nosworthy, to whom I had an introduction from Wm. V. Chalmers-Francis of Los Angeles, using a modern McKesson gas machine and the carbon dioxid absorption technique.

His first patient was a man aged 61, scheduled for a cholecystectomy. I was late, and the patient had been intubated when I arrived. Doctor Nosworthy was giving him nitrous oxid-oxygen and ether, and carrying him lightly—to conserve his strength. The operation was progressing quite slowly because of adhesions, but the patient's condition was entirely satisfactory. About an hour later the blood pressure began to fall, and Doctor Nosworthy administered 500 cubic centimeters of glucose intravenously. When the operation was finished, at the end of the second hour, the patient left the table, apparently in very good condition.

The next patient was a husky young workman of twenty, to be operated on for an undescended testicle. Doctor Nosworthy gave him nitrous oxid-oxygen and ether, having considerable difficulty with the induction, as we all do at times when handling this type of patient. I could not help thinking how much Doctor Nosworthy might enjoy handling the same patient with ethylene or cyclopropane, and not being obliged to use ether.

The third patient was a woman of forty-five, in for the reduction of a Colles' fracture. Doctor Nosworthy gave her 5 cubic centimeters of 10 per cent pentothal, which seemed the right dose of the right agent, so perfect was the result. Again I wondered if it was the relative weakness of nitrous oxid as an anesthetic agent that has helped cause the rush toward intravenous anesthesia in England and the Scandinavian countries.

LONDON—ST. THOMAS HOSPITAL

A few days later I watched Doctor Nosworthy work at St. Thomas Hospital. When I arrived, they were well along on a pelvic laparotomy under gas-ether anesthesia. Doctor Nosworthy had shut off his absorber, and increased the flow of gas and oxygen to about ninety gallons per hour, because of the patient's greatly increased respiratory rate, which had run up to sixty per minute, in spite of the use of fresh soda lime. We soon came to the conclusion that this might have been due to overetherization, since about four ounces had been used, or it might have been due to the fact that the obese patient had been too long in deep Trendelenburg position. Doctor Nosworthy had been using the carbon dioxid absorption technique for a few months only, and said he still had a tendency to forsake it, and go back to his old ways whenever any difficulty arose.

Several other patients at St. Thomas' that afternoon were given pentothal with strikingly satisfactory results, and Doctor Nosworthy admitted that he was using it increasingly in place of gas for minor operations. After the surgery was finished, tea was served in the physician's dressing room, and a pleasant social hour was enjoyed.

My next introduction was to Dr. Ronald Jarman, one of the foremost anesthetists in London. He works chiefly for "Mr." Abel, one of London's leading surgeons. Their first patient was to have a sympathectomy for a cervical rib. Doctor Jarman uses pentothal induction for most of his

patients, so this patient was given 5 cubic centimeters of 10 per cent pentothal rather rapidly, and she promptly stopped breathing. Doctor Jarmin then endeavored to intubate her, but was unsuccessful, because of laryngeal spasm. He then tried to insufflate the lungs with oxygen by means of bag pressure, still with no result. Doctor Abel, the surgeon, finally interfered to the extent of applying pressure to the chest a few times, after which the patient began to breathe again. Nitrous oxid was then started and the operation finished without further difficulty.

Doctor Abel's second patient was a large, florid male, scheduled for an appendectomy. Doctor Jarman gave him 3 cubic centimeters of pentothal in his room, and another 3 cubic centimeters when he reached the surgery. He followed this with nitrous oxid-oxygen, plus a small quantity of ether, with partial rebreathing. Because the pentothal had greatly lowered the metabolic rate, little carbon dioxid was being produced, and I was amazed to see how much rebreathing it was possible to use, in spite of the fact that the machine was not equipped with an absorber.

Another day I went with Doctor Jarman to a nursing home, where Doctor Abel was to operate. This nursing home was a remodeled residence, as I understand most of them are, and was hardly the place for important major surgery. However, it is an old British custom to take care of the private patients under these adverse conditions, and now that world conditions are so chaotic there seems little hope of a change in the situation in the near future.

On this day, the patient was a woman of 63, scheduled for a resection of a portion of the colon for a carcinoma. Her hemoglobin was only 50 per cent, in spite of the fact that she had had a transfusion on the previous day, so she was to receive intravenous fluid throughout the operation, and was to have another transfusion that afternoon. Doctor Jarman gave her 3 cubic centimeters of 10 per cent pentothal in her room, followed with a percain spinal block in the surgery. The administration of the percain was quite dramatic, since the patient had been thoroughly relaxed by the pentothal, and had to be supported in a sitting posture by two nurses while the spinal tap was made. As soon as she was in position on the table nitrous oxid-oxygen was started, and the operation begun. An hour later, when I was forced to leave, Doctor Abel was well along with the operation, and was removing a large mass, along with a portion of the colon, in the region of the splenic flexure. I heard from Doctor Jarman recently, and he said that the patient had made an uneventful recovery, having had the colostomy closed some time ago, and being again capable of normal activities.

IN CONCLUSION

In conclusion, I should say that anesthesia on the Continent has lagged considerably behind anesthesia in our own country. Perhaps because gas and gas machines were so expensive, their use did not spread on the Continent during the post-war years, as in England and the United States. Even when the carbon dioxid absorption method was developed, and the cost of gas became a negligible item, the widespread dependence on ether continued. Recently, however, a large number of Continental clinics have been using intravenous anesthesia extensively, not only for minor and short operations, but for all kinds of surgery. I am convinced that this is an unhealthy development, comparable to the wave of enthusiasm for spinal anesthesia that swept this country only a short ten years ago. However, it may be that they are really setting the pace for us, rather than going off at a tangent as it now appears.

In England the picture is very different. Anesthesia there was never turned over to technicians, as in our country, so their personnel set-up is much better than our own—physicians giving all of the anesthetics, and professional anesthesia having been a recognized specialty for generations. As a result, they have been the leaders in the art of anesthesia. However, their ingrained conservatism is such that they have fallen behind in the present forward surge of anesthesia progress. I understand that chloroform is still used fairly frequently, even to the extent of being the anesthetic of choice at many places in the outlying districts. They failed to accept ethylene when it was brought out by Luckhardt in 1923, and are now just as staunchly refusing to try cyclopropane. However, the carbon dioxid absorption method has finally found favor over there, and is being rapidly taken up by the more progressive men. With this necessary preliminary step taken I predict that in England they will soon join the procession, and give cyclopropane a trial.

1252 Third Avenue.

CONSERVATIVE RENAL SURGERY WITH PARTICULAR REFERENCE TO KIDNEY TRAUMA*

By Lloyd E. Kindall, M.D.
Oakland

With the trend toward conservative renal surgery, I wish to present to you a brief résumé of ten recent cases of kidney trauma, emphasizing the following points in their management:

1. Every traumatized kidney requires absolute bed rest.
2. The amount of pain complained of by the patient does not determine the severity of the kidney injury.
3. The severity of the body injury does not determine the severity of the kidney trauma.
4. Intravenous urography is invaluable in the diagnosis of kidney trauma, and it should be done as soon as possible after injury.
5. Conservative surgery should be practiced in every case. A safe rule to follow is to explore every kidney where there is a gross hematuria

* Chairman's address, Urology Section of the California Medical Association, at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

From the Urological Service of Alameda County Hospital, Oakland.

lasting over twenty-four hours, and more especially in that case in which pyelograms show either intra- or extracapsular extravasation of the sodium or iodine salt.

REPORT OF CASES

Case 1.—O. G., male, age 19. Had been drinking. While driving a car, he ran into a lamp-post and was thrown out of the car. This caused a severe body injury. He was temporarily unconscious, but soon recovered, and was taken to the Alameda County Emergency at 8:25 p. m. and put to bed. The next morning he passed bloody urine and complained of severe pain in the right kidney region.

Intravenous Urography.—Showed incomplete filling of the calices, but the pelvis appeared normal; there was no break in the renal parenchyma.

Course.—There was no gross hematuria, but the urine contained microscopic red blood cells. The pain in the flank had subsided.

Three days later retrograde pyelograms were normal, and the patient's urine was normal.

The patient was kept in bed for fourteen days and then discharged.

COMMENT

This was a severe body injury, which caused gross haematuria and severe pain in the kidney region. These two symptoms both subsided in twenty-four hours. The intravenous pyelograms were negative. The patient recovered with bed-rest.

* * *

Case 2.—W. R., a male, age 21. Was in a motorcycle accident, but did not remember the details. He was brought to the Emergency Hospital, in shock, at 2:15 a. m. His blood pressure was 70/54; he complained of pain in the back, and was in shock; his left flank was tender; the first urination was bloody. At 9:00 a. m., his blood pressure was 112/64; there was contusion, spasticity, and bulging of the left lumbar region.

Intravenous Urography.—Showed the transverse processes of the first, second, third and fourth lumbar vertebrae on the left, pulled off and displaced laterally. The right kidney was normal. On the left there was some evidence of function, but no definite outline of pelvis or calices. The diagnosis was ruptured kidney. The patient was given glucose, and was taken to the surgery.

Surgery.—Revealed marked perirenal hemorrhage; the kidney was badly contused and showed numerous areas of infarction, and it was torn at the hilum, probably destroying most of the blood supply. Nephrectomy was done, followed by one blood transfusion. The patient recovered.

COMMENT

This was a severe body injury, which caused severe trauma to the kidney, as demonstrated by the gross hematuria and the intravenous urograms. This patient was operated upon in less than twelve hours and, at surgery, the kidney was found to be so damaged that nephrectomy was necessary. Delay and observation, in this case, would have caused much blood loss. I feel that this case was properly managed, and that the surgery was conservative.

* * *

Case 3.—E. T., a male, age 12. Was riding a bicycle along a cliff, when he suddenly rode over the cliff and fell twenty feet. This resulted in a severe injury. He was brought to the Emergency Hospital in mild shock. His clavicle and wrist were fractured. He was suffering from abrasions. He complained of pain in the left costovertebral angle and left abdomen. His urine showed fifteen to thirty red blood cells to the H. D. F.

Next day the patient had pain in the left upper quadrant and his abdomen was distended. A Payne tube was inserted into his stomach, and much gas was removed, but his abdomen continued paining.

Intravenous Urography.—On the second day showed an apparently normal right kidney. There was some filling of the left kidney, but the pelvis and calices were not clearly outlined. The diagnosis was probable traumatized kidney. The urine continued to have microscopic red blood cells for a few days only. The patient was treated conservatively because the bleeding was only microscopic in character, and the pain gradually subsided. He was discharged eighteen days after entry.

COMMENT

This patient received a severe injury which caused pain in the kidney region, but the trauma to the kidney was slight, as evidenced by microscopic red-blood cells only in the urine. The intravenous urograms were not conclusive, because they were made on the second day after injury, when the abdomen was distended with gas. If intravenous urograms had been taken shortly after injury they would have given us much more information. The patient recovered with bed-rest.

* * *

Case 4.—A. S., a male, age 41. Was struck by an automobile while crossing the street. Upon admission to the Emergency Hospital his hemoglobin was 76 per cent; his red blood count was 4,300,000; his urine was grossly bloody; there was a palpable mass in his left abdomen; his abdomen was distended, and his general condition was poor.

X-rays taken upon admission showed fractures of the fourth, fifth, sixth, seventh, eighth, ninth, tenth and eleventh ribs on the left, in midscapular line. The kidneys were not visible.

X-rays of the lungs, taken three days later, showed a generalized haziness of the left chest, due to edema and hemorrhage into the lung, with a pneumonic process developing in the base of the right lung.

On the fourth day the patient's hemoglobin was 60 per cent; his red blood count was 3,425,000; he had a well developed pneumonia, and his condition was poor.

On the fifth day the hematuria stopped, and the urine contained only a few microscopic red blood cells. During this time the patient was too sick to be moved to x-ray for intravenous urography.

Cystoscopy done on the thirty-ninth day, with retrograde pyelograms, showed normal kidneys, with no evidence of injury. Two days later the patient was discharged as well.

COMMENT

This case demonstrates a very severe body injury, with an injury to the kidney severe enough to cause gross hematuria lasting five days. However, retrograde pyelograms, taken thirty-nine days after injury, showed normal kidneys, with no evidence of rupture. Intravenous urograms could not be made because of the patient's poor condition. It seems to me that a patient who recovers from eight fractured ribs, a hemorrhage into one lung, and a pneumonia in the other lung, is entitled to escape with normal kidneys.

* * *

Case 5.—W. A., a male, age 20. Was in an automobile accident, and was thrown against the side of the rumble seat, injuring his right flank. He was brought into the hospital unconscious and in shock. There was rigidity of both upper quadrants and marked tenderness of the right flank. His urine was grossly bloody. After recovering consciousness, the patient had severe pain in the right kidney region.

Intravenous Urography.—The next morning showed a normal left kidney; the right kidney showed torsion and appeared opposite the third and fourth lumbar vertebrae; the right major and minor calices were not well demonstrated; this indicated perirenal hemorrhage, with displace-

Fig. 1

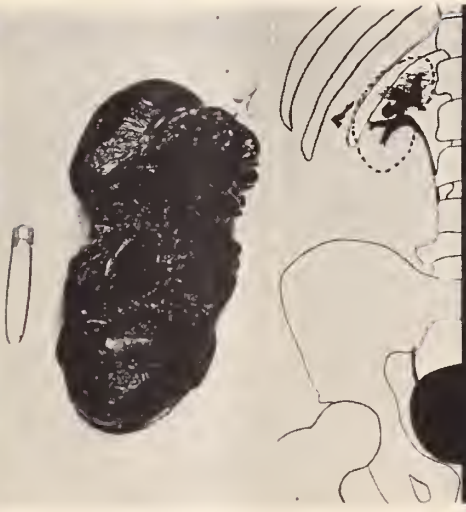

Fig. 2

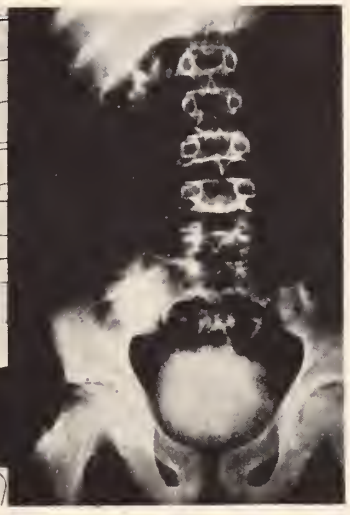

Fig. 3

Fig. 1.—Retrograde pyelogram showing extravasation of the sodium iodide in the lower pole. There was continual bleeding from the left kidney.

Fig. 2.—Demonstrates extensive ruptures of the kidney which were not demonstrated with retrograde pyelograms. Intravenous urography would probably have demonstrated more of the ruptures. (See Figure 1.)

Fig. 3.—Intravenous urogram illustrating intracapsular extravasation of the iodine salt in the upper pole, and also extracapsular extravasation.

ment of the kidney downward. On this same day, the urine showed microscopic blood cells only. The patient's general condition was good; there was some tenderness in his right flank.

Retrograde pyelograms taken four days later showed the right kidney in abnormal position, with the right ureter displaced medially. There were shadows of extravasation into the kidney parenchyma opposite the upper minor calyx.

Ten days later the right kidney could not be palpated; there was no tenderness and no symptoms; the urine was negative. The patient was discharged to his home for bedrest.

COMMENT

This case demonstrates a severe body injury which caused marked kidney pain and immediate gross hematuria; but the hematuria stopped within twenty-four hours. The intravenous urograms which were taken indicated perirenal hemorrhage, pushing the kidney downward, but showed no evidence of intracapsular rupture. This patient was treated conservatively because the hemorrhage stopped within twenty-four hours.

* * *

CASE 6.—E. U., a female, age 16. Was in an automobile accident, in which she was thrown forcibly onto the limb of a tree from a car, injuring her right side. She complained of severe pain in her right lower ribs and in the right lower quadrant; there was marked guarding over her entire abdomen; she vomited several times; her pulse was 100; her urine was smoky, and there were thirty to forty red blood cells to the H. D. F.

Two days later the patient still had pain in her abdomen and right flank; there was a slight elevation in temperature; her urine was grossly bloody at times; at other times there were only microscopic red blood cells. During this period the patient was under observation in the surgical department of the hospital.

Five days after admission the patient had no complaints; her urine was clear; her condition excellent.

Seven days after admission the patient passed bright red blood. Next day she was transferred to the G. U. Service. She had no complaints, but there was tenderness and rigidity of the right abdomen. Cystoscopy was done that night, revealing a blood clot at the right ureteral opening; there was bloody urine from the right kidney, and more pain in the right flank, with marked tenderness and rigidity at the right costovertebral angle.

Surgery disclosed two large ruptures at the lower pole, with a general maceration of the lower half of the kidney. Nephrectomy was done. The patient was given two blood transfusions.

COMMENT

This patient was treated conservatively for eight days before being transferred to urological service. With the history of intermittent hematuria and marked pain in the right kidney region for eight days, and with cystoscopy revealing blood clots at the right ureteral opening, surgery was definitely indicated. At operation, the kidney was found to be so extensively damaged that nephrectomy was necessary. This case demonstrates a severe body injury, with such severe kidney damage that, had it been turned over to the urological department upon admission, an intravenous urography would have been done, and surgery would not have been delayed so long.

* * *

CASE 7.—C. K., a female, age 27. Fell off a horse three days before admission to the hospital, injuring her left side, and had had a constant total hematuria. Upon admission to the hospital, her blood pressure was 105/75, her pulse was 56, and she looked pale. There was a marked tenderness at the left costovertebral angle. Her hemoglobin was 70 per cent; her red blood count was 4,180,000; white blood count 20,600; polynuclears 65 per cent.

Intravenous Urography was done upon admission (three days after injury), with the following conclusions: Right kidney, normal pelvis and calices; left kidney: "There is nothing in these films diagnostic of rupture of the left kidney; there is definite diminution in the excretion of this side; there is absence of filling of the calices on the left, except for a small amount in the superior calyx, which may possibly be slightly farther away from the pelvis than one would expect from comparison with the other side."

Exploratory Operation.—Revealed a rupture at the anterior aspect of the left kidney near the hilus; this was cleansed of clotted blood and filled with a piece of fat; the edges of the kidney were approximated with mattress sutures. Following surgery, the patient was given two blood transfusions.

Cystoscopy, twenty-six days later. Dye was excreted from both kidneys in five minutes, both normal density;

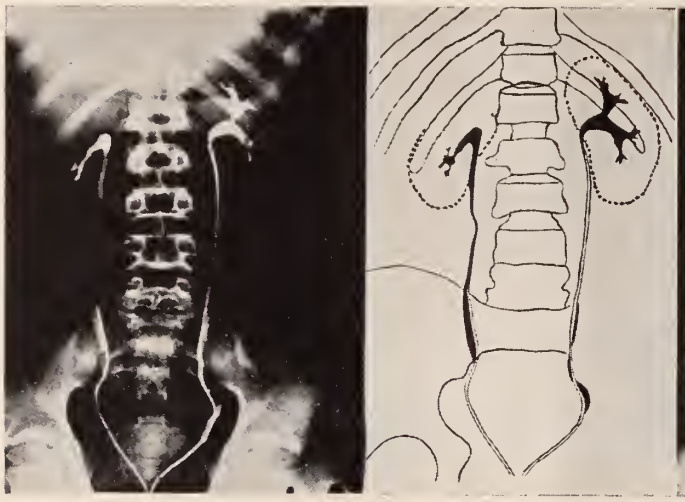

Fig. 4

Fig. 5

Fig. 4.—Retrograde pyelogram demonstrating the lower pole of kidney following surgical repair of the upper pole. The function of this lower pole is very good. This patient is now working and is free of symptoms.

Fig. 5.—Intravenous urogram, twenty-four hours after injury, demonstrating both intra- and extracapsular extravasation of iodide salt.

retrograde pyelograms showed normal kidneys in normal position, with nothing to suggest rupture of the left kidney. The patient was discharged as cured.

COMMENT

This case demonstrates a severe body injury and a severe kidney injury, with no pain. There had been constant total hematuria for three days. Commenting on the x-ray report of the intravenous urograms taken three days after injury (the report reads: "There is nothing in these films diagnostic of rupture of the left kidney; there is definite diminution in the excretion of this side; there is absence of filling of the calices on the left, etc."), I feel that, in many cases where there is a tear in the renal parenchyma extending into the kidney drainage system, causing total hematuria, the iodine salt excreted in the kidney will be carried down the drainage system with the blood too rapidly to give a satisfactory urogram. This is one case in which intravenous urograms failed. Surgical repair of the lacerated kidney saved the kidney, as evidenced by normal function and by pyelograms taken twenty-six days after surgery.

* * *

CASE 8.—P. B., a male, age 17. Was hit by an automobile while riding a motorcycle. This was a severe body injury. He was in shock when brought to Emergency, had pain in his left flank, and gross hematuria. He was given sedatives and placed under observation.

Cystoscopy was done next day, and a left ureteral catheter was left in situ for drainage. Retrograde pyelograms showed extravasation of the sodium iodide into the lower pole. (Fig. 1.)

The second day there was marked rigidity of the left flank and gross hematuria.

The third day surgery was done, with the hope that sutures could be placed in the lower pole to control bleeding. (Fig. 2.) There was a large area of rupture in the mideal portion of one side of the kidney, extending into the renal pelvis for a distance of 5 centimeters, which almost severed the lower pole. On the opposite side, there were two linear rupture lines measuring 3 centimeters and 2 centimeters in length, approximately in the mid-portion of the kidney. There were several infarcted areas in the lower pole.

Nephrectomy was done, followed by two blood transfusions.

COMMENT

This patient had a severe body injury, with severe kidney damage; the pain was constant and severe; gross hematuria was constant; the retrograde pyelograms showed extravasation of the sodium iodide solution in the parenchyma of the lower pole. However, the patient was treated conservatively; but when the gross hematuria persisted after forty-eight hours, an exploratory operation was done, with the hope that a mattress suture could be placed through the lower pole to control bleeding. The kidney was found to be damaged beyond repair and had to be removed. I feel that intravenous urograms would have given us much more information, and surgery would not have been delayed so long.

* * *

CASE 9.—S. L., a male, age 14. Fell on a curb, striking his right side, and had immediate pain in his right flank. This was a mild body injury. When brought to the Emergency Hospital he had gross hematuria and marked tenderness of the right flank extending from the costovertebral angle to the right lower quadrant. The patient did not look ill. His general condition was good.

Intravenous Urography.—Was done next day, which demonstrated both intra- and extracapsular extravasation of the iodine salt. The patient's urine was still grossly bloody. This second day the patient's urine was still bloody, there was more pain in the right flank, and his pulse rate was going up.

Surgery.—Disclosed much perirenal bleeding; the upper pole of the kidney was badly contused, and there was a split of about 4 centimeters in its long diameter, parallel to the axis of the kidney. After separating the clots in the rupture of the upper pole, an upper branch of the renal artery was found spurting at the pedicle, and it was ligated. The rupture was sutured with ribbon gut, in the expectation that the upper pole of the kidney would atrophy. The patient was given four blood transfusions at intervals thereafter.

Follow-up.—This patient ran a moderate fever for six weeks. An exploratory operation was done after twenty-eight days, revealing a nodular upper pole, but no pus. The patient was in the hospital for fifty-six days. (Fig. 4.)

COMMENT

This case demonstrates a slight body injury and a severe kidney injury. The patient should have

Fig. 6

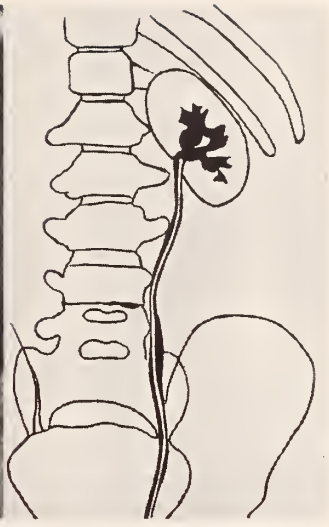

Fig. 7

Fig. 6.—Sketch made of kidney as demonstrated at surgery. (See Figure 5.) Note complete transverse rupture extending through kidney pelvis. The shaded area in the lower pole represents the area of infarction which was removed. The kidney was then sutured with ribbon catgut.

Fig. 7.—Retrograde pyelogram (See Figures 5 and 6) made seven months after surgical repair. Note the connection between the minor calices of the upper and lower poles. The function of this kidney is normal; there is no infection; there are no symptoms of pain or discomfort.

been operated upon the first day, instead of the second day after admission. There would have been less blood loss. Also, if the upper pole had been removed at the time of surgery, the exploratory second operation and the long course of fever might have been prevented. This prolonged fever was probably due to absorption of the necrotic upper pole, which had lost its blood supply. The patient still has the lower pole of the kidney, which has excellent function. He has no symptoms.

* * *

Case 10.—B. H., a female, age 9. Fell on the concrete curbing, striking her left side. This was not a severe body injury. She was taken to the Emergency Hospital with a pain in her left flank, and gross hematuria. She did not look sick.

Intravenous Urograms were made the first day following admission. (Fig. 5.) The patient still had gross hematuria. She was in good condition.

The second day following admission there was still gross hematuria.

Intravenous Urography was repeated, and surgery was done that evening. (Fig. 6.) There was much perirenal hemorrhage. After separating the fatty capsule, first the lower half and then the upper half of the kidney was brought out through the incision, the kidney being ruptured transversely across the center, dividing the pelvis and part of the pedicle. In the mesial end of the lower half of the kidney there was an infarcted area of about three-fourths of an inch in width that was grayish-white in color. This was removed with a scalpel. The upper and lower poles were then sutured together. The patient was given two blood transfusions. Thirty-seven days after surgery the sinus was healed.

Pyelograms were taken one week after the sinus was healed. Follow-up retrograde pyelograms were taken seven months after repair surgery was done. (Fig. 7.)

COMMENT

This patient demonstrates a mild body injury, with severe kidney trauma. Gross hematuria was constant, but the patient complained of very little pain. She should have been operated upon the first, instead of the second day following injury, because the urograms showed both extra- and intracapsular rupture. This case demonstrates what can be done surgically with some of these ruptured kidneys where a pole of the kidney has been severed, and intravenous urography has demonstrated the function of the injured kidney. In this instance we knew that the upper and the lower poles functioned normally before surgery. Is the seven months after follow-up pyelogram made too early to determine the future function of this kidney? At the present time, the patient is free of symptoms, the kidney function is normal, the urine is free of pus cells, and the culture of the urine is sterile.

* * *

DISCUSSION

I have recommended no type of operation nor the use of any type of suture.

I have made no attempt to classify kidney ruptures, nor would I attempt to classify or enumerate any of the various signs and symptoms. I have, however, briefly described the management of ten cases.

I have described to you cases in which all symptoms subsided and the gross hematuria stopped within twenty-four hours.

I have described cases of severe body injury, accompanied by severe pain, in which there was only mild trauma to the kidney.

I have also described to you the type of injury which is characterized clinically by a gross hematuria lasting over twenty-four hours, initial shock, with a fall in blood pressure, increased pulse rate, etc., where the usual conservative treatment is generally advised, namely: rest, sedatives, frequent examinations of the blood count and blood pressure, and x-ray examinations, until the patient becomes weak from loss of blood.

I have described to you two cases of mild body injury in which severe kidney damage was done, where the patient had very few clinical symptoms, except gross hematuria.

What, then, is the best procedure to follow in these cases where gross hematuria persists after twenty-four hours?

Many experiments have been made on the kidneys of various animals, under various conditions, which are illuminating, but which, I feel, do not have any direct bearing on human kidneys, as I have shown that the severity of the body injury does not determine the severity of the kidney injury. Sufficient data is not available to tell us what eventually happens to these traumatized kidneys which are left to repair themselves, nor what happens to those which are repaired surgically.

I am of the opinion that intravenous urography is the most important deciding factor in determining the extent of kidney damage and the consequent management of the individual case. This should be done as soon as possible, because delay allows more gas to form in the intestinal tract in the cases of severe injury where there is perirenal bleeding. The shadow of this gas on the x-ray films may interfere with the reading of the intravenous urograms. If an intravenous urography is unsuccessful at first, it should be repeated or combined with retrograde pyelograms. Either intravenous or retrograde pyelograms taken alone may be unsuccessful. Intravenous urography will generally give us an outline of the ureters and bladder; and, should the ureter or bladder be ruptured, the extravasation of the dye can, as a rule, be readily detected. Intravenous urography will also tell us if the patient has a normal kidney on the unaffected side, the assurance of which gives a comfortable feeling when operating on an injured kidney.

To repeat what I stated above, conservative surgery should be practiced in every case. A safe rule to follow is to explore every kidney that has a gross hematuria lasting over twenty-four hours, and more especially in that case in which intravenous or retrograde pyelograms show either intra- or extracapsular extravasation of the dye. I feel that this is conservative surgery. While it is true that some pathological kidneys are more apt to rupture following injury than a normal kidney, we can assume for all practical purposes that the injury has taken place on a normal kidney (as was the fact in these ten cases which I have cited), which makes the exposure of the kidney an easy matter. It is not like operating on infected kidneys, for example, which are densely bound down with adhesions. The injured kidney can generally be brought out well into the incision and explored, and repair can be done easily. In some of these cases we delayed unnecessarily too long with surgery, requiring, in some instances, two or more blood transfusions to make up for the loss of blood. The hemoglobin and red blood cell count will not give an estimation as to the amount of blood loss until some twenty-four hours after bleeding, when the blood stream will then have had time to take in fluids to make up for the blood loss.

CONCLUSIONS

1. In every case of trauma to the kidney, the patient should be kept at absolute bed rest, and intravenous urography should be done as soon as possible.

2. Do not depend upon pain as a measure of the extent of kidney damage.

3. Gross hematuria, accompanied by little or no pain, does not necessarily mean slight kidney trauma.

4. In every kidney injury where gross hematuria persists after twenty-four hours, an exploratory operation should be seriously considered. In a case where there is gross hematuria following injury, and intravenous urograms show rupture, surgery becomes imperative if that gross hematuria lasts over twenty-four hours. That is what I mean by conservative surgery in kidney trauma.

TUBERCULOUS TRACHEOBRONCHITIS: A REVIEW*

By PHILIP H. PIERSON, M.D.
San Francisco
AND
PAUL C. SAMSON, M.D.
Oakland

DISCUSSION *by John C. Jones, M.D., Los Angeles; Sidney J. Shipman, M.D., San Francisco.*

MUCOSAL tuberculosis of the trachea and bronchi needs emphasis as an important and relatively frequent complication of pulmonary tuberculosis. Eloesser[1] has contributed greatly to our knowledge of this subject. Experience with more than one hundred cases of tuberculous tracheobronchitis has convinced us that this condition often may be serious. In the group of patients showing advanced ulcerative and stenotic lesions, there has been a mortality of approximately 50 per cent regardless of the type of treatment that was used for the pulmonary tuberculosis.

INCIDENCE

A recent study[2] was made of 272 patients with adult pulmonary tuberculosis who were admitted to a sanatorium. Active or healed tuberculous lesions were found bronchoscopically in thirty (11 per cent). In twenty-four of the thirty the presence of bronchial pathology was suspected prior to bronchoscopy because of symptoms and roentgenographic changes. Mucosal disease was found in many patients whose pulmonary tuberculosis was of relatively short duration. There was no evidence that the use of active collapse therapy favored the development of mucosal lesions.

BRONCHOSCOPY

Bronchoscopy[3] should always be used to confirm a suggestive diagnosis, and is contraindicated only by laryngeal ulceration, tuberculous pneumonia, and severe hemoptysis. Skill in passing the instrument is essential. Mucosal lesions result from contact with bacillary sputum.[4] In its early stages the dis-

Read before the General Medicine Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

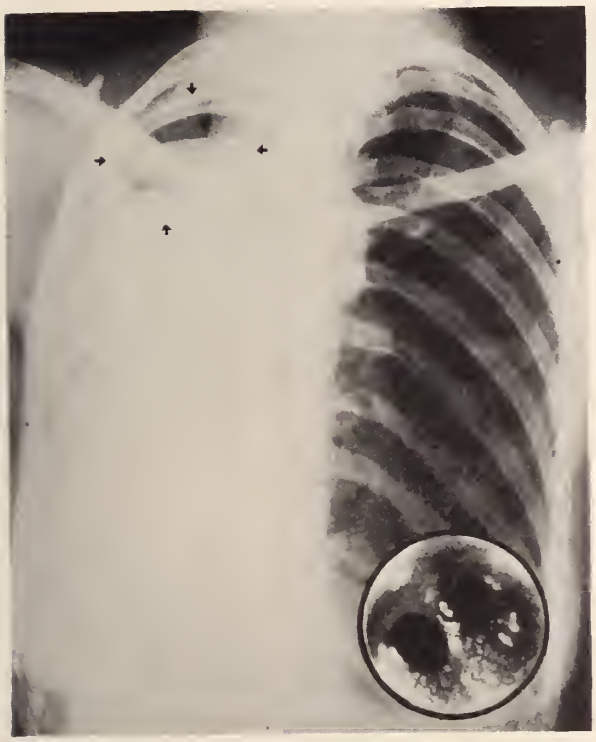

Fig. 1.—Progressive atelectasis of the right lung with tennis-ball cavity. Insert shows original extent of acute hyperplastic mucosal tuberculosis, limited to the stem bronchus. The tracheal mucosa was later involved. Roentgen therapy resulting in severe lower tracheal and bronchial stenosis. Death. Such a lesion now would be treated with electrocautery when first seen.

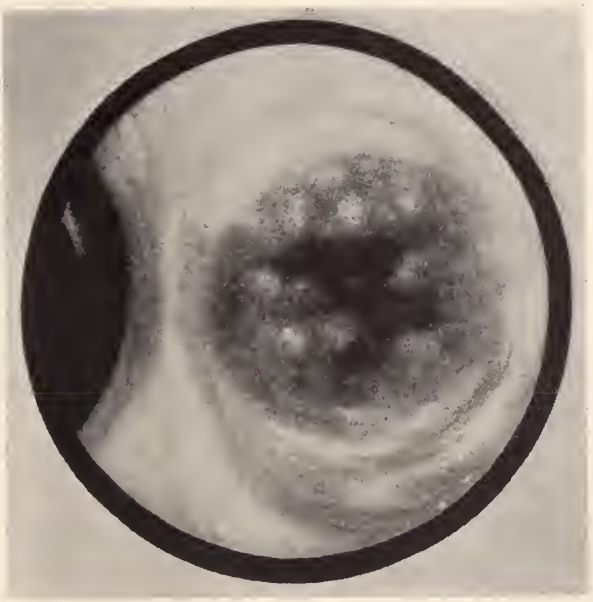

Fig. 2.—Pure fibrostenosis of the right stem bronchus at the carina. The patient wheezed, had difficulty in raising sputum, and was slightly dyspneic. Dilatation on three occasions prior to thoracoplasty gave great symptomatic relief. Operation without incident.

ease is seen at the lobar bronchial orifices. The stem bronchus may then become involved circumferentially. Finally, the tracheal mucosa is affected by direct extension. Several types of lesions may be recognized.

1. The mucosa may show ulceration which occasionally extends to the cartilaginous rings. Obstructing granulation tissue may be present. Ulcerative disease always is potentially serious, and frequently progresses after the pulmonary tuberculosis is controlled.[5] Acid-fast bacilli are constantly present in cases of bronchial ulceration. At present active collapse therapy is not recommended unless the ulcers are regressing or unless local treatment of the mucosal disease is possible. Spontaneous regression has been noted but it cannot be predicted.

2. Submucosal tuberculosis may show as a flattened, nonobstructive lesion with discrete tubercles. The mucosa is edematous, granular, and bleeds easily. Occasionally there may be difficulty in distinguishing between submucosal tuberculosis and nonspecific infection. It would appear that submucosal disease is relatively less active than is the ulcerative type, the former usually healing with adequate control of the pulmonary infection. Occasionally, submucosal tuberculosis becomes hyperplastic and the formation of tuberculomas may cause partial obstruction of the lumen. These lesions may progress and they deserve active treatment.

3. Fibrostenosis may result from the healing of hyperplastic or ulcerative lesions. The clinical importance of a fibrostenosis depends upon its location and the degree of obstruction which it causes. Death has resulted directly from obstruction. Other patients have remained chronically ill because of occurrence of bronchiectasis with retained purulent secretions, distal to a stenosis.

We have seen extension of the pulmonary tuberculosis following biopsy of tuberculous mucosal lesions, and feel, therefore, that this procedure should not be done unless some means is available for immediately cauterizing the biopsied area.

SYMPTOMS AND ROENTGENOGRAPHIC FINDINGS

Symptoms of most importance include: persistent oral wheeze and rhonci; asthmatoid attacks with tenacious sputum; paroxysmal cough and difficult expectoration; positive sputum, in spite of quiescent pulmonary tuberculosis.

Roentgenographically, *atelectasis* is significant. This may be lobar or involve a whole lung; intermittent or progressive and permanent. Failure of a cavity to collapse with adequate pneumothorax, failure of pulmonary reëxpansion and "tennis-ball" or "balloon" cavities also are caused by obstructive mucosal tuberculosis. The combination in one lung of a tennis-ball cavity and atelectasis apparently is pathognomonic of bronchial disease (Fig. 1).

Tennis-ball cavities are worthy of special note because their significance usually is not appreciated. Roentgenographically they are large and round and tend to balloon peripherally, assuming the contour of some portion of the chest. When in the upper lobe, the inferolateral margin of the cavity appears to cut sharply mesialward. A lobe or an entire lung may be replaced by a single cavity. Tennis-ball cavities apparently are produced by mucosal disease, causing an expiratory check-valve obstruction in a second or third order bronchus. The check-valve mechanism has been described by

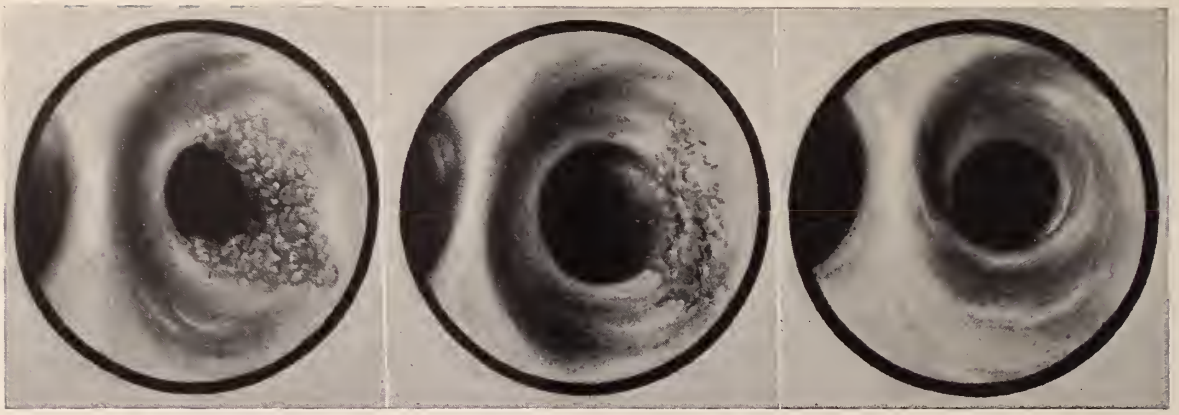

Fig. 3 (a).—Granuloulcerative mucosal tuberculosis of right stem bronchus at the carina, before treatment with electrocautery. Sputum highly positive on smear. Atelectasis of right upper lobe but no active pulmonary tuberculosis. (b) Regression after three treatments at fourteen-day intervals. (c) Complete healing after total of five treatments. The sputum has been persistently negative on culture for eighteen months.

Jackson in connection with foreign bodies in the bronchus, and more recently by Coryllos[6] in tuberculosis. Intracavity manometric pressures are usually greater than atmospheric. Following the withdrawal of air the pressures may return to positive after coughing, thus proving their connection with the bronchial tree. Salkin's[7] theory that these cavities are entirely blocked does not appear to be substantiated. He could not explain the persistence of auscultatory cavity signs in his cases, but it must have been on the basis of a bronchial connection. In cases of tennis-ball cavity bronchoscopy may be negative, but the instillation of iodized oil usually shows the obstruction in a secondary or tertiary bronchus.

TREATMENT

Experience has shown repeatedly that symptomatic medical treatment for mucosal tuberculosis is worthless. No cure has been reported from tuberculin therapy. If a suffocative death is threatened, palliation may be accomplished by bronchoscopic aspiration.

In pure fibrostenosis of a stem bronchus bronchoscopy with mechanical dilatation is the treatment of choice. This may be performed prior to thoracoplasty (Fig. 2) or between stages, if obstructive symptoms develop. Rarely the obstruction is so great that dilatation cannot be done. In these cases lobectomy or pneumonectomy must be considered instead of thoracoplasty. Pneumonectomies have been performed successfully by Jones,[8] Alexander, and Holman for extensive bronchial obstruction. Tennis-ball cavities may be extremely resistant to treatment. If collapse therapy fails, lobectomy or external drainage of the cavity must be considered. Fibrostenosis of the trachea is always grave. Collapse therapy invariably aggravates the patient's distress. Bouginage with solid dilators has not been successful, but the use of graduated-sized bronchoscopes can give temporary relief.

Since hyperplastic and ulcerative mucosal tuberculosis often is progressive, we feel that active local treatment is indicated, usually in conjunction with pulmonary collapse. Two methods only have been used with success.

If the entire lesion is accessible to the bronchoscope, we favor the use of local electrocautery with the high-frequency current. Both acute and chronic lesions can be treated. Special small-diameter bronchoscopic electrodes have been designed. Partially obstructing masses of granulation tissue can be removed and the base cauterized in a series of three or more treatments (Fig. 3). This method has the advantage of affecting only the active lesions, and often there is no great increase in stenosis. Perforation of the bronchial wall, with hemorrhage, is a possible complication. At the present time a number of cases are being treated with favorable results. Ultra-violet therapy may be used as an adjunct to electrocautery. When used alone, however, it has not proved effective for obstructing granulo-ulcerative lesions.

The second method of treatment is by the roentgen ray. Destruction of granulation tissue, healing of ulceration and hastening of fibrosis, can be accomplished. There are certain definite hazards and other tissues may be damaged. In six patients out of twelve, radiation was of unquestioned value. In the remaining six, results were poor. Roentgen therapy should not be used in patients with acute mucosal tuberculosis. In general radiation now is reserved for the chronic lesions which, because of technical difficulties, cannot be treated by electrocauterization.

In conclusion, mucosal tuberculosis of the lower airway is a relatively common complication of pulmonary tuberculosis and shows characteristic symptoms and roentgenologic changes. The importance of bronchoscopy in diagnosis and treatment should be remembered. Local treatment is indicated in the more advanced forms, including bronchoscopic dilatation, electrocauterization, ultra-violet and roentgen radiation. Occasionally the secondary effects of bronchial obstruction may necessitate lobectomy, pneumonectomy, or the external drainage of a tuberculous cavity.

DISCUSSION

John C. Jones, M. D. (427 South Arden Boulevard, Los Angeles).—As the result of the increased and discrete employment of the bronchoscope in cases of tuberculosis of lungs with tracheobronchial symptoms, many heretofore unexplained clinical and roentgen "mysteries" have been solved. This has been accomplished without great sacrifice and discomfort to the patient, without major complications, and has led to a considerable number of patients being spared major surgery when the latter would have been fatal or at least carried a high morbidity. At the same time local treatment of these lesions through the bronchoscope will result in the arrest of tuberculous disease in a certain number of cases where persistent positive sputum alone holds the patient bedfast a long time in spite of a roentgenogram which failed to show parenchymal activity.

Of all these cases of tuberculous tracheobronchitis, probably those of a stenosing character, with tuberculous bronchiectasis and severe secondary infection distal to the stenosis, carry the gravest prognosis by virtue of their poor bronchial drainage and its inevitable severe toxicity. Collapse therapy fails to alleviate the burden of this toxicity, and may only increase it if the drainage is further hampered by "bronchial kinking." The ideal treatment is eradication of the disease by lobectomy or pneumonectomy, depending on the location and extent of the disease.

About one year ago we had a 28-year-old female with tuberculous bronchiectasis of the entire left lung as the result of a tuberculous ulcerating stenosis of the left main stem bronchus. Her temperature had been elevated to 102 and 103 degrees Fahrenheit persistently for two and one-half years, during which time bed rest, pneumothorax, and phrenicectomy had failed to relieve her symptoms. She had lost forty pounds in weight and had continued a downhill course throughout her sanatorium treatment. A total left pneumonectomy with drainage was completed eleven months ago and the patient had an uneventful surgical postoperative course. In three months she regained all her lost weight and was without fever and sputum, but a fistulous tract persisted in the chest wall when she was discharged from the hospital four months postoperatively. Unfortunately, following two months of too active life on the outside, she returned with an exudative contralateral spread which has shown a progressive clearing without excavation on return to bed rest in the hospital.

Sidney J. Shipman, M. D. (490 Post Street, San Francisco).—Doctors Pierson and Samson's discussion of tuberculous tracheobronchitis is very timely indeed. The entire subject is a new one, for although the effects of this disease have been observed for many years, the significance of the condition has remained almost completely unrecognized.

Tuberculous patients who have been doing well but who suddenly begin to wheeze, particularly if this wheezing is localized to the affected lobe or lung, should be suspected of having tuberculous bronchitis. Whether general or local treatment is advisable depends upon the individual case. Tuttle of Detroit recommends 35 per cent silver nitrate applied locally through the bronchoscope. I, personally, prefer general irradiation with the quartz lamp to the point of tanning, particularly in the early, allergic reactions which it is so important to recognize. Probably this form of treatment is less and less effective as time goes on, until, of course, it has no effect at all on the scarred stenoses.

The relationship of the condition to "tennis-ball cavities" is interesting, as the authors have pointed out. It is well recognized now that not all cavities are the result of the expectoration of caseous material, but that they develop as the result of the valve effect due to diseased bronchi. The lumen of the bronchus is diminished, the bronchus expands during inspiration, allowing air to enter the lung, but contracts on expiration and does not permit it to get out. Apparently this mechanism keeps cavities blown up or prevents their collapse. Theoretically, a return of the bronchus to normal should eliminate this mechanism, although certain writers, notably Coryllos, have contended that it would be better to have the condition go on to complete closure of the bronchus, when absorption of the air and closure of the cavity should take place. Whether either or both of these ideas are correct, time will tell.

Meanwhile the subject is a fascinating one for investigation, and it is to be hoped that Pierson and Samson will continue the work which they have so well described.

ROENTGEN TREATMENT OF CERTAIN HEMORRHAGIC DISORDERS*

By L. H. Garland, M.D.
San Francisco

Discussion *by R. S. Stone, M. D., San Francisco; John C. Ruddock, M. D., Los Angeles; S. P. Lucia, M. D., San Francisco.*

FOUR years after Frank's[5] description of thrombocytopenic purpura as a separate entity, in 1920, Stephan[17] reported two cases as cured, following roentgen irradiation to the spleen. Since that time there have been many reports of single cases or small series of cases treated by irradiation, some with favorable results and some unfavorable. Doubtless, among the reasons for the variability in results is the variability in severity of individual cases of thrombocytopenic purpura hemorrhagica; another reason is the variable and, in some cases, the incomplete nature of the roentgen therapy given. With more careful classification and selection of cases, and with irradiation, especially of cases of splenic thrombocytopenic purpura hemorrhagica, results appear to be much more encouraging.

IN THROMBOCYTOPENIC PURPURA

Mettier and Stone[10] treated six patients with essential thrombocytopenic purpura by fairly large doses of roentgen rays to the spleen, and secured remissions lasting up to four years. Four of the cases were acute, and two of the cases chronic. Most of the patients received 200 r daily or every second day to the spleen, using fields approximately 10 by 15 centimeters (200 KV, filter equivalent to 1.00 millimeter of copper). A total of from six to twelve treatments was given to most of the cases. All of the patients showed remarkable increases in platelet counts immediately or soon after irradiation, the rise being approximately 500 per cent. Following the platelet response, the clotting mechanism gradually became normal and the bleeding gradually lessened. In the chronic cases the plate-

*Roentgen treatment of the spleen, to shorten bleeding time in thrombocytopenic purpura and in postoperative capillary hemorrhage.

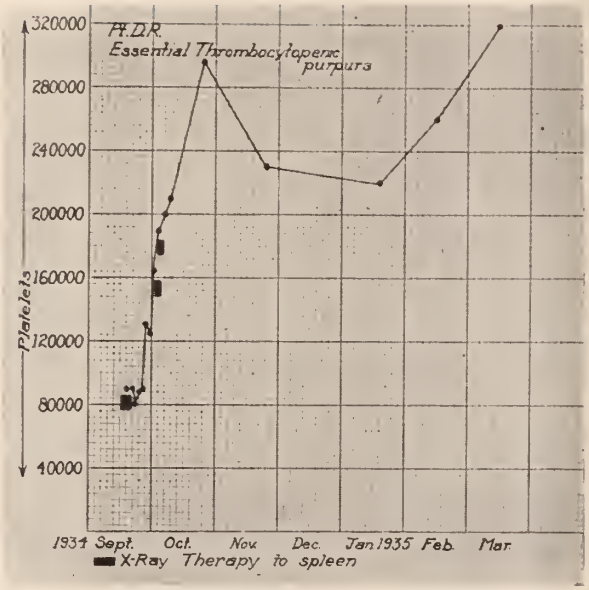

Fig. 1.—Chart illustrating increase in blood platelets, following roentgen irradiation of spleen—in case of essential thrombocytopenia. (Figures 1 to 4 are by kind courtesy of Doctors Mettier and Stone.)

lets dropped again soon after treatment was discontinued, but apparently without associated bleeding. One case of acute fulminating purpura resisted all treatment. In summary, five of six cases did well, but one patient with acute fulminating purpura died.

Rudisill [14] treated eight cases of thrombocytopenia (four purpuric and four nonpurpuric) with a somewhat similar technique, 200 r to the spleen, repeated from one to six times (200 KV, filter equivalent to 0.5 millimeter of copper, field 20 centimeters in diameter). He "found roentgen treatment so satisfactory that it is impossible to understand why it has not come to be considered practically a specific therapeutic agent in primary thrombopenia with hemorrhage." Seven of the cases showed complete remissions, lasting from one to four years, the average being over two years. One patient, a boy of eight, complicated by acute myelogenous leukemia, died of the leukemia.

Marzullo [9] reported four cases of thrombocytopenic purpura treated by x-rays, two of which patients improved but recurred, two died, one over a year after treatment. In this case, bleeding time fell from twelve to two and one-half minutes following treatment.

Results of Splenectomy.—In contrast with the above results from roentgen therapy, it is well to compare the results of splenectomy. Brown and Elliott [3] reported twenty-one cases of thrombocytopenic purpura hemorrhagica; ten were treated by splenectomy (one mild case, six moderate, and three severe cases) in eight of whom excellent remissions were secured; one of the patients improved and one died. The average duration of the remissions was over five years, varying from one to eleven years. The other eleven cases were not operated on; five improved, five remained unimproved, and one died. None was treated by splenic irradiation.

Marzullo [9] reported nine cases treated by splenectomy, five of whom recovered, two recurred, and two died.

Mettier,[11] commenting on splenectomy, observes that "removal of the spleen is not entirely satisfactory; the mortality rate is high and a high percentage of patients have recurrence of symptoms."

RATIONALE OF TREATMENT

The exact reason for improvement in purpura hemorrhagica following splenic irradiation is not known. It is quite definite that irradiation is followed by an increase in blood platelets, diminution in bleeding time,† and coincident diminution or disappearance in hemorrhagic tendency. Rudisill believes that there may be two distinct classes of essential thrombocytopenic purpura; one secondary to toxemia and one secondary to unknown causes. In the former class, "the spleen's function" of platelet destruction "need only be lowered, until the toxemia is overcome" (usually accomplished by one to three roentgen treatments), but in the latter case "it may be necessary to render the spleen permanently functionless by intensive irradiation." (The question of this so-called roentgen-ray "splenectomy" is also discussed by Mettier and Stone.[10]) Lucia [7] observes that "exposures to x-ray alter the plasma in such a way as to inhibit bleeding."

ROENTGEN THERAPY FOR CAPILLARY OOZING AND INCREASED COAGULATION TIME

There is very little literature on the control of increased coagulation time and capillary oozing by roentgen irradiation of the spleen, except incidental to that already referred to above in connection with the treatment of purpura hemorrhagica. Markovits [8] refers to work by Tichy and Nigst, but does not give any specific references. With Dr. Roy Parkinson we recently studied the effect of roentgen irradiation of the spleen in "normal" persons—mostly patients admitted to the hospital‡ for minor surgery; sixty-one patients were given a single dose of 160 r to the spleen and forty-eight patients were untreated.[13] The investigation was conducted as follows: a platelet count and coagulation time was determined at 7:30 a. m. The

† Note on coagulation and bleeding time:

Coagulation time: The coagulation time is the time which the blood takes to clot after it has been shed. As determined by different methods, it varies considerably, since the criterion of clotting is not the same in all. On this account the values are not absolute, and the results obtained by different methods cannot be compared strictly with one another. A simple method is to draw a drop of blood into a capillary glass tube about 10 cm. long, and break off a section from time to time until fine threads of fibrin appear between the ends of the broken sections; the time elapsing from making the wound to the time of fibrin development is the coagulation time (about four minutes being normal).

Bleeding time: The bleeding time is the time a drop of blood (produced by pricking the skin) takes to clot sufficiently to close the puncture and stop the bleeding. It is determined by pricking the skin and touching the wound every few seconds with a piece of filter paper, the moment when the latter ceases to be stained being the end-point (normally about three minutes). The coagulation time is a better gauge of the body's ability to protect itself against hemorrhage than the bleeding time.

In hemophilia the coagulation time is greatly prolonged, but not the bleeding time; the platelets are not decreased in number, but show lessened fragility; the clot usually retracts normally. In purpura hemorrhagica thrombocytopenica the coagulation time is usually within normal limits, but the bleeding time is prolonged; the platelets are decreased in number; the clot does not retract normally and is soft and friable.

‡ St. Joseph's Hospital, San Francisco.

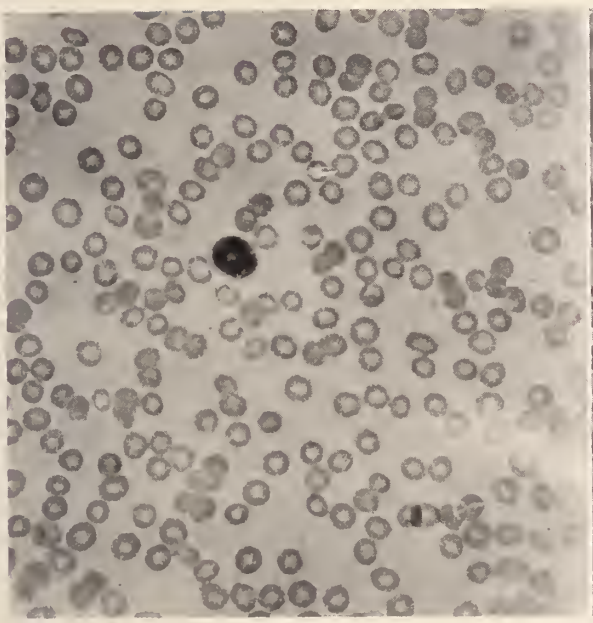

Fig. 2

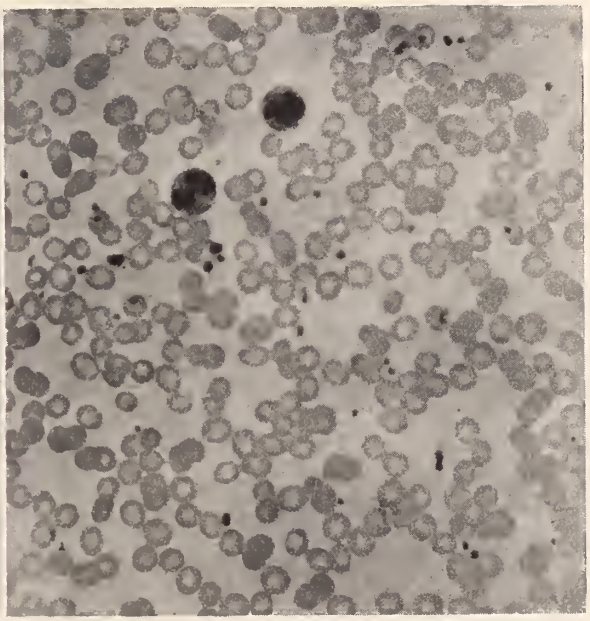

Fig. 3

Fig. 3.—Blood smear showing presence of large number of platelets in same patient as Fig. 2, following splenic irradiation.

treated cases were then given a dose of 160 r to the spleen. In a number of cases, a platelet count and coagulation time was done immediately after finishing treatment, and in all cases was done at 4 p. m. The surgical procedure was done at approximately 8 a. m. Similarly, in the control cases, platelet counts and coagulation times were determined at 7:30 a. m. and 4 p. m., and similar surgical procedures were performed at 8 a. m.

In fifty-nine of the sixty-one cases treated by x-rays there was a drop in coagulation time averaging 2.5 minutes, and an increase in platelet count of from five- to sevenfold. The most significant drops in coagulation time were in those cases in which the coagulation time taken before irradiation (that is, patient's "normal" coagulation time) was six minutes or more. For example, in a group of fifteen patients with coagulation time exceeding six minutes, the average time before irradiation was 7 minutes 41 seconds, and after irradiation 3 minutes 42 seconds. The change took place immediately. The surgeon often observed that the operative field was strikingly dry—so remarkably so that, for example, in tonsillectomy cases he was able to tell whether the patient had or had not received irradiation by the amount of capillary oozing.

In the forty-eight control cases there was an average drop in the coagulation time of a little less than half a minute, attributed presumably to the surgical procedure or the anesthesia.

Coagulation times were done by the capillary method, using one millimeter diameter tubes and taking blood from the ear. The platelet counts were done by the chamber method, using Wyckoff's modified platelet stain. Doctor Downey kindly supervised this part of the work, using different laboratory workers and internes from time to time in order to avoid bias. The x-ray factors used were 130 KVP, filter of 0.25 millimeter copper, 25 centimeters target-skin distance, 13 centimeters diameter skin area, single dose of 160 r (measured in air, without backscatter).

RATIONALE OF TREATMENT

Markovits[8] believes that roentgen irradiation causes "disintegration of leukocytes and lymphocytes in the spleen, with consequent liberation of a ferment which promotes coagulation." However, other authors (Nigst, Szenes, Gal, Amreich[8]) allege that acceleration of blood coagulation also occurs following irradiation of other organs, such as the liver, lung, and parotid. Arkussky[1] reports decrease in iron excretion following irradiation of rabbits' spleens, with associated storage of iron in the liver. Bourne[2] reports that there is a significant drop in the polymorphonuclear leukocytes in the spleen following irradiation. However, we do not know whether it is a splenic or "total blood stream" effect. Sokolov[16] has shown that irradiation affects certain mineral constituents of the blood plasma, producing physiochemical changes that affect the general organism.

INDICATIONS FOR SPLENIC IRRADIATION IN HEMORRHAGIC DISORDERS OTHER THAN PURPURA

From the above observations it is obvious that splenic irradiation is of considerable value as a preoperative measure in patients with low platelet counts or increased coagulation times. It is also of value in some benign uterine hemorrhages. Volpe[18] reports a series of cases of metrorrhagia in young women, apparently cured by doses of 200 r to the spleen repeated after five days, and again at monthly intervals for from two to six treatments. Markovits[8] suggests its use also in melena neonatorum, hemophilia, and chlorosis. We have not used it in any of these kinds of cases, but

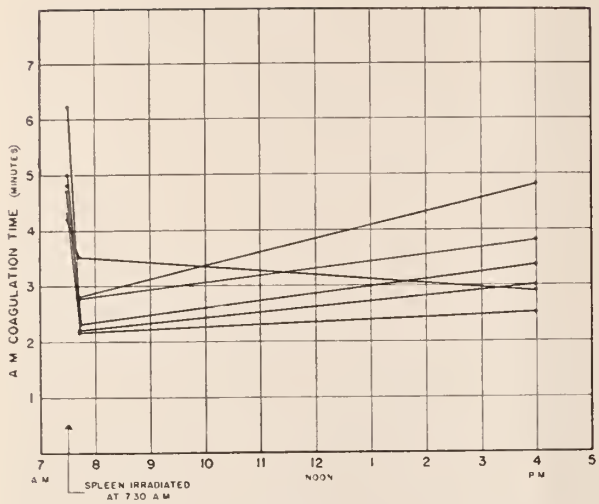

Fig. 4

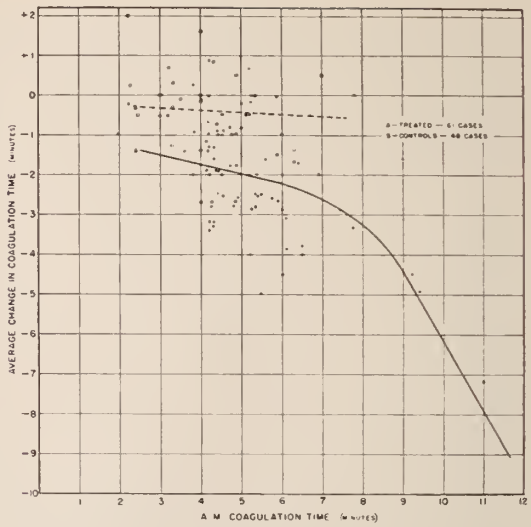

Fig. 5

Fig. 4.—Chart showing shortening of coagulation time immediately, and for twelve hours following splenic irradiation (six cases).

Fig. 5.—Chart showing shortening of coagulation time eight hours after splenic irradiation (sixty-one cases) with controls (forty-eight cases).

see no reason why it should not be tried following or in conjunction with the use of the more time-honored and simpler remedies. It may also be valuable in epistaxis, gastric oozing, and in other types of bleeding.

SUMMARY

Moderate or large doses of x-rays administered to the spleen control or produce long remissions in many cases of essential thrombocytopenic purpura hemorrhagica. A sufficient number of years has not yet elapsed to warrant the conclusion that the treatment is superior to splenectomy, but recent reports suggest that it is at least equally effective as such, with, of course, a zero mortality from the treatment itself. In cases in which it is proposed to attempt ablation of splenic function by irradiation it would be advisable to check the accuracy of the roentgen beam centering by means of a film, since the spleen is variable in position and it is obviously important to be certain that the entire organ is being irradiated.

Small doses of x-ray administered over the spleen of a patient with increased coagulation time produce rapid decrease in coagulation time, with associated rise in platelets and consequent control of capillary hemorrhage. The treatment causes no inconvenience to the patient and may, indeed, be done en route to the operating room, or, with a bedside unit, in the case of those gravely ill. Irradiation is simple, rapid and effective in a high percentage of cases.

DISCUSSION

R. S. Stone, M.D. (University of California Hospital, San Francisco).—Doctor Garland was kind enough to refer, in his discussion, to the paper by Doctor Mettier and myself on the irradiation treatment of patients with essential thrombocytopenic purpura hemorrhagica. In connection with the work which Doctor Mettier and I reported, I can only add that we are still as satisfied with the method of treatment as we were when the report was made, and that patients there reported are continuing to do well. The administration of further x-ray therapy to these patients has been extremely rare.

In a recent issue of the *Journal of the American Medical Association* there was an article by Doctor Wintrobe on

purpura hemorrhagica, and in it x-ray therapy was given extremely small mention. I think that this is evidence of the fact that the irradiation treatment of the spleen for purpuric conditions is not sufficiently well understood or appreciated. This is most likely due to the fact that the amount of irradiation given in the majority of instances is not sufficient to accomplish the results desired. If only one or two treatments are given to the spleen, there may be a temporary increase in the platelet count, and a cessation of hemorrhage; but if the treatment is not carried to a much higher level the platelets are likely to drop again and the condition recur. We have found it necessary to carry the treatments to as much as 1,200 roentgens to the spleen from at least two ports in order to make the cure more or less permanent.

I have not had the opportunity to check or repeat the work which Doctor Garland has done in connection with roentgen therapy for capillary oozing and increased coagulation time. I am extremely interested in this work, and it opens up a new field. If the preoperative irradiation of patients whose coagulation time is prolonged were established as a routine, it seems likely that the marked bleeding of these cases would be a thing of the past. From Doctor Garland's report it would seem that this would be a logical step, particularly in the case of tonsillectomy operations. I hope that this work of x-ray treatment of the spleen will receive a more widespread attention, and be given a more thorough trial in the future, so that either corroboration or disproval of the results which he has reported, and those which Doctor Mettier and I reported at an earlier time, may become established.

❦

John C. Ruddock, M.D. (1930 Wilshire Boulevard, Los Angeles).—The subject of the treatment of thrombocytopenic purpura hemorrhagica is one that has been before the medical profession since 1925, at the time Pancoast, Pendergrass, and Fitzhugh published "The Status of Roentgen-Ray Treatment by Irradiation of the Spleen." Controversy between surgeons and roentgenologists has been evident as to which is the best method of treatment.

The roentgenologists certainly can say that there is a zero mortality from the treatment itself. The surgeons state that, by the complete removal of the spleen, they reduce the possibility of remissions. It is a question whether complete ablation of the spleen can be done by roentgen-ray without other effects upon the body than the purpose for which the splenectomy was done.

Cases are often encountered of thrombocytopenic purpura, with active bleeding, in which the patient is practically "bled out," and in spite of transfusions it is impossible for them to retain enough blood to build them up. X-ray therapy is slow, but I must say that it is safe at this stage. Often we must give repeated transfusions during the irradiation of the spleen, as the bleeding does not stop immediately, but may continue for a number of days before clotting and bleeding time approach normal. It is my opinion that when this has been accomplished, and by means of transfusions the blood volume has been returned to normal, that a splenectomy should be done. It is my opinion, also, that remissions, if these patients were treated by a combination of roentgen-ray and surgery, would be fewer and the surgical risks would be lessened if the patients received irradiation in order that they may be made a good risk.

The irradiation of the spleen in normal persons prior to minor surgery in order to guard against capillary oozing and postsurgical hemorrhage is excellent, and I believe it is a timely subject.

Doctor Garland should be complimented on his excellent review on the subject of this type of disease treatment, and on his calling attention to the fact that, due to the variability and severity of individual cases and variability of the nature of the roentgen therapy given, much variability will be noted in the results reported from the treatment of this disorder both by roentgenologists and surgeons.

❦

S. P. Lucia, M.D. (2529 Union Street, San Francisco). Variation in the results of roentgen irradiation of the spleen in thrombocytopenic purpura hemorrhagica is a matter not only of variability in the severity of individual cases, and in some instances of inadequacy of amount of roentgen therapy, but also of variability in the type of the disease. Thrombocytopenic purpura is usually a symptom-complex of a more complicated disease involving alterations in structure of the hematopoietic tissues and blood plasma, and in permeability of capillaries. It may be a manifestation of infections, leukemia, heavy metal therapy, or arteriosclerosis. A variety of this condition, occasionally congenital, is seen in women who suffer from endocrine glandular hypofunction. All types of purpura may or may not be associated with splenomegaly.

The purpuric state is not necessarily associated with thrombocytopenia—in fact the blood platelets may be found to be increased in numbers. Frequently it is difficult to state which factor—platelets, plasma, or capillaries—is most important in a given case. One thing is certain: that in order that purpura may occur, the capillaries must be abnormally permeable. It is indeed unfortunate that the varieties of thrombocytopenic purpura cannot always be differentiated or the mechanism of their production be understood. This, I believe, is the reason for discord in the reports of the results of treatment found in the literature.

Before the treatment of thrombocytopenic purpura hemorrhagica can be placed on a rational basis, more careful study must be made of plasma, capillaries, and platelets in individual cases. It is important also to learn the mechanism by which blood platelets are increased and the manner in which the coagulation of blood is altered after exposure to roentgen irradiation.

In conclusion, it may be stated that: (1) Acute purpura without splenomegaly is best treated by transfusion. This variety frequently proves refractive to all therapeutic measures, including roentgen irradiation and splenectomy. (2) Chronic purpura without splenomegaly (refractive to medical treatment) may react favorably to roentgen irradiation for limited periods of time. (3) Acute purpura with splenomegaly (usually secondary to some more complex disease) frequently gives a favorable response temporarily to a variety of therapeutic measures, including roentgen irradiation. (4) Chronic purpura with splenomegaly usually responds satisfactorily to roentgen irradiation.

VITAMIN D IN ACNE*

A COMPARISON WITH X-RAY TREATMENT

By Merlin T.-R. Maynard, M.D.
San Jose

Discussion *by George V. Kulchar, M.D. San Francisco; Henry J. Templeton, M.D., Oakland; Nelson Paul Anderson, M.D., Los Angeles.*

THERE is probably no skin disease of greater importance to the human race than acne. It is undoubtedly our commonest skin disease, and it is rare that any individual reaches maturity without having had it in one of its phases. It is a disease of considerable economic importance, as the disfiguring scars of a severe case are never completely obliterated. It is also a disease of youth. It attains its most noxious form at the time the individual first has to earn his own living. It is undoubtedly responsible for many failures in getting business positions. It is also the basis for inferiority complexes and discouragement in young people.

The dermatologist sees only a small percentage of patients, since many patients are not treated in the expectancy of the condition being outgrown. A goodly percentage are treated over the drug counter or by the family doctor, usually with little success. In dermatological practice, acne cases are likely to rank about third in the frequency of skin diseases, and for this reason are of considerable

* Read before the Dermatology and Syphilology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

importance to the specialist. The dermatologist has many weapons with which to attack the disease, as listed below.

OUTLINE OF ACNE THERAPY

1. Dietary.
2. Endocrine.
3. Vaccines and bacteriophage.
4. Local.
5. Physiotherapeutic.
 a. Ultra-violet light.
 b. X-ray.
6. Chemotherapy.
 a. Colloidal manganese.
 b. Saline and glucose.
 c. Sulphids by mouth.

COMMENT CONCERNING THERAPEUTIC MEASURES

I hardly need call to your attention, as dermatologists, the dissatisfaction of the above treatments; but I will run over them briefly.

Dietary treatment alone has rarely resulted in a cure. The type of diet depends upon which school of thought we follow. If we believe in a low carbohydrate diet, our results seem about the same as when we allow a dominant amount of this factor. Undoubtedly, food sensitization does play some part, and chocolate, for example, should certainly be eliminated.

The *endocrine factor* in treatment has always appealed to the professional mind. This is natural, in view of the fact that acne is a disease of puberty and its future years only. I think we can say that no endocrine extract has been sufficiently successful to warrant a major place in our therapeutic attack. When anterior pituitary "S" fraction first came on the market, I used it experimentally on twelve cases. I gave a total of 150 injections to these patients. I undoubtedly got good results in the early adolescent type, and was able to prevent the menstrual flare-up in women. I found, however, that my cases relapsed on discontinuing the injections, and the patients were dissatisfied. There is a distinct question in my mind whether or not anterior pituitary is justifiable, except as an adjunct to other therapy.

Vaccines and bacteriophage have their champions, and I believe that we may yet find these procedures to be more useful than they have been in the past. At the present time, the high cost to the patient, the time lost in treatment, and their uncertain results place them still in the experimental stage. Local treatment has been used for centuries and has changed little except in the elegance of the preparation applied.

Local treatment is of undoubted benefit, and simple cases will commonly require nothing else. The nature of the acne process, and the barrier of the hyperkeratotic reactions of the duct, with the comedone formation, make it impossible to get sufficient penetration for any deep effect. The preparations of sulphur have always dominated this field. Chemotherapy has made some definite strides in the past few years. Colloidal manganese has given excellent results in the hands of E. L. Oliver and G. M. Crawford.[1] Intravenous sodium chlorid injections have been reported favorably by Goodman,[2] G. M. Crawford and J. H. Swartz[3]; likewise have found promise in the similar use of dextrose solution. These procedures are well worth a trial. I have personally used them too little to comment on them further.

Physiotherapeutic procedures have been most prominent in the last two decades. These have mainly consisted of ultra-violet light and x-ray. About ten years ago ultra-violet light began to wane in popularity. In the past few years a review of the literature shows that the firm position of x-ray has been somewhat undermined. A decade ago x-ray was used almost without question on all patients. We found it of much value. We were able to produce cures and excellent cosmetic results. We were successful in severe cases that were doomed to lifelong disfigurement, unless the process was quickly stopped. X-ray still dominates the field in severe cases. It has been my experience, and I am sure the experience of all of you, that too high a percentage of cases will relapse after x-ray therapy, if that alone is used in treatment. I do not deny that we can get more cures with x-ray than with any other procedure. But the reasons for failure, and the reasons for relapse, have been behind the development of the study here presented. I might say that a further disadvantage to x-ray is that its competent use is only sparsely available to the patient. There is a great hinterland of the country where skilled roentgen therapy is unheard of, and the acne sufferers must depend upon the advice of the general practitioner for care. I, therefore, believe it is the responsibility of the dermatologists to place in the hands of these practitioners the type of treatment that will halt or modify the ravishes of disfiguring acne. I should not neglect to say, however, that x-ray therapy, properly used, will not produce damage to the patient. Ultra-violet light therapy has been discouraging, because it does not prevent recurrences of the disease, and requires numerous and expensive visits to the doctor's office.

In the foregoing part of this paper an attempt has been made to point out forms of treatment that have a definite value. I would say that, as a general rule, the disadvantages are those of requiring frequent treatment, expense of administration, and lack of general constructive effect.

VIOSTEROL IN ACNE

The patient commonly asks the doctor if he "shouldn't have something for his blood." We also feel that the patient should be put in the best possible health. The missing elements, or the excess thereof, that cause acne to develop in the adolescent, should receive every intelligent consideration. It was in response to this need that, in 1933, I started, in acne cases, giving viosterol by mouth. This was stimulated later by the results of A. Doktorsky and S. S. Platt.[4] I read an abstract of this paper in January, 1934, in the Year Book of Dermatology. I then began to use vitamin D in all cases, and have continued it up to the present time. The use of vitamin D seemed to fit in where needed. It improved the patients' general nutrition; many of them put on weight, and the majority of them felt much better. Its use

seemed rational. Vitamin D is synthesized in the skin on exposure to sunlight. Might not this be the factor that caused healing on ultra-violet therapy? Vitamin D is a mobilizer of calcium. It is probably withdrawn from its reservoir in the skin at puberty for the purpose of the utilization of calcium in growth of bone and muscle. Vitamin D has the further advantage of reasonable cost.

The subject of vitamin effects in the body is so large that I will not attempt to make a prolonged dissertation on the subject. The Council of Pharmacy and Chemistry state that the following are allowable claims in relation to vitamin D:

> Animal experimentation has shown that correction of an inadequate dosage of vitamin D results in the more economical utilization of calcium and phosphorus, and also that the undesirable effects of improper ratios of calcium and phosphorus in the diet can largely be overcome by normal intake of vitamin D. . . . It may be stated that vitamin D has a favorable influence on calcium and phosphorus metabolism.

DANGERS OF VITAMIN D ADMINISTRATION

Dr. C. D. Leake [5] has pointed out that certain dangers exist in the unregulated intake of vitamin D preparations. He states that these symptoms are largely due to the substance "toxisterol," and that this preparation should be carefully guarded against in the manufacturing of the product. The symptoms brought on by vitamin D toxicity appear about two weeks after the high daily dosage begins. The patient is nauseated, dizzy, and has tingling in the extremities. There may also be vomiting, diarrhea, and polyuria. Mild symptoms of toxicity occurred twice in my series of cases.

In regard to dosage of vitamin D, we probably have considerable latitude. The statement is made that 200 drops a day may be given with safety to juveniles. The Council on Pharmacy and Chemistry of the American Medical Association suggests a maximum daily dose of 1,000 units in lay advertising. Larger doses, of course, may be given under the supervision of a physician. C. I. Read of Chicago, in a study made of the administration of highly concentrated vitamins of 10,000 X gave to three hundred patients, ranging from seven to seventy-two years of age, doses of from 3,000 to 2,760,000 international units daily, or a maximum of 920 times the normal antirachitic dose of 3,000 international units. This group of forty-three patients showed symptoms of toxicity of varying degrees.

GENERAL PHYSICAL EFFECTS

The general physical effects of viosterol administration are those of increase of appetite, improved food absorption, gain in weight, and a general sense of well-being.

The reaction of the patients on the mental side has been helpful. Their improvement in appetite, and often a lessening of fatigue, have been factors of value in getting coöperation in treatment. In no instance, except in the above-mentioned cases of intolerance, have I had a patient dissatisfied with this form of treatment. From the standpoint of the physician it effectively answers the old question, "What can we do to improve the patient's general health?"

DISCUSSION

Before going forward with the discussion of my survey I wish to state that I cannot claim that viosterol is more effective, if given alone, than it might be when incorporated with the other recognized vitamins. It is quite possible that the addition of vitamin A would be of value, and it is my intention to make a further survey of cases in which this has been done. Up to the present time, however, I do not believe that the addition of vitamin A helps the patient's response, and it does definitely increase the expense. It is also likely that vitamin D is not the most effective of this group, and only a future series will make possible a comparison.

I consider the following cases to be fair illustrations in this series.

REPORT OF CASES

Case 1.—December 5, 1936. R. W., age thirteen. Adolescent acne comedone. Sister, age thirty, has acne. Number of deep lesions present. Given lotio alba cream and viosterol, twenty drops each morning.

January 9, 1937. Appetite fine. Skin dry and much better; deeper lesions absorbing.

February 13, 1937. Pimples stopped; blackheads dry. To apply hot compresses to remove. This patient is illustrative of a normal response.

* * *

Case 2.—June 17, 1935. Miss B. H., age nineteen. Acne two years. Feels tired; menses normal; bowels somewhat constipated. Acne of deep cystic type in chin area. Viosterol, twenty drops daily, prescribed.

July 9, 1935. Weight 119, gained three pounds; appetite better; still tired; acne distinctly better.

August 6, 1935. Better.

September 3, 1935. Weight 117 pounds. Almost healed.

January 31, 1936. No longer tired; feels fine. A few new lesions around Christmas time. Entirely satisfactory.

This patient gives evidence of general favorable effect.

* * *

Case 3.—February 18, 1935. J. D., age seventeen. Severe acne two years. Lesions deep with marked induration. X-ray considered advisable. Given viosterol, twenty drops daily.

March 4, 1935. Distinctly better. Unable to afford x-ray.

March 22, 1935. Letter stating, "Getting along fine. Face much better."

April 9, 1935. Letter stating, "Feels much better, and face looks 100 per cent better."

This patient gives verbal evidence of enthusiasm.

* * *

Case 4.—March 16, 1934. C. D. Severe acne vulgaris of the face for three years. Past history was negative. Mother had acne. X-ray considered advisable. Given lotio alba cream and viosterol, twenty drops daily.

April 27, 1934. Much better.

June 25, 1934. Better; a few pustules with last menses; appetite better; has gained weight.

June 8, 1935. Has been much better, but recently has relapsed moderately. X-ray advised. Given x-ray, sixteen treatments, with complete healing.

This patient demonstrates improvement with partial relapse, but also a slow response to x-ray treatment. This patient would be a slow result with either treatment. The response to viosterol is favorable, however.

Case 5.—August 13, 1934. A. C., age 21. Acne, moderately, four years. Has had one and one-half years of x-ray treatment by dermatologist elsewhere. Healing unsatisfactory. Menses irregular, and is constipated, high-strung, and nervous. Was given viosterol, twenty drops daily.

September 14, 1934. Better.

October 13, 1934. Doing well.

November 10, 1934. Healed.

The above case demonstrates healing with viosterol after failure with x-ray.

* * *

Case 6.—August 3, 1935. M. R., age twenty. Severe acne, with scarring, for six years. Had fifteen x-ray treatments by dermatologist elsewhere without healing. Given viosterol, twenty drops daily.

September 30, 1935. Much better. Gained five pounds.

May 25, 1936. Having no lesions. Taking forty drops of viosterol daily.

September 28, 1936. Still healed.

Illustrative of healing after x-ray failure.

* * *

Case 7.—June 16, 1936. R. K., age twenty-six. Acne since age fourteen; cystic type. Given viosterol, forty drops daily. On July 10, reduced to thirty drops.

September 18, 1936. Gained six pounds. Has more vigor, larger appetite, sleeps better. Practically healed.

The above patient demonstrates an undoubted response.

* * *

Case 8.—November 28, 1936. M. W., age twenty-one, male. Cystic abscesses back of the neck. Given viosterol, twenty drops daily. Advised that x-ray probably would be necessary.

December 11, 1936. Appetite much better. Lesions absorbing. Takes twenty drops daily.

January 8, 1937. Much better, absorbing.

March 5, 1937. All lesions healed.

The above patient demonstrates an exceptional result from what is commonly a resistant form.

* * *

Case 9.—February 29, 1936. F. F., age seventeen. Severe acne for four years on face and back; has considerable scarring. Tires easily, otherwise in good health. Given viosterol, forty drops daily; also iron.

April 18, 1936. Some flare-up with menses.

May 23, 1936. Feels a lot better generally; about 80 per cent improvement.

July 18, 1936. Relapsing. Is living in very hot climate. X-ray advised, and was given thirteen treatments. Healed.

March 4, 1937. Moderate recurrence.

The above patient demonstrates healing followed by relapse on change of climate in spite of excessive sunlight, healing with x-ray, with subsequent partial relapse.

* * *

Case 10.—October 27, 1935. N. D. M., age twenty-four. Deep cystic acne on face of several years' duration. Given viosterol, twenty drops daily; also hydrochloric acid.

November 19, 1935. Two pustules only. Viosterol increased to forty drops daily.

February 18, 1936. Splendid result. Complete healing.

November 2, 1936. Did not take viosterol during summer and has relapsed. The patient requests x-ray treatments. X-ray was given; twelve treatments, with complete healing.

The above patient demonstrates complete healing with viosterol, with subsequent relapse, followed by healing on a normal amount of x-ray treatment.

* * *

Case 11.—August 17, 1936. A. C., age twenty-one. Acne for five years; deep pustular type. Given viosterol, forty drops daily.

October 17, 1936. Viosterol reduced to twenty drops. About the same.

November 24, 1936. Acne completely healed. Skin oily.

February 11, 1937. Still healed.

The above patient demonstrates the healing of acne without influence on the oiliness of the skin.

COMMENT ON AUTHOR'S SERIES

My study has taken me through all of my acne cases since 1930. I discarded from my list those patients that failed to report back for a sufficient period to be studied. My total survey comprised 480 cases. The cases eliminated because of incomplete or confusing factors brought the survey down to 255. Of these, 123 patients were treated by means other than the use of viosterol, and 132 on viosterol; 86 were treated with x-ray. The dietary instructions were identical in both series. The patients were instructed to eat plenty of green vegetables and lean meats, preferably rare, with fruits for dessert. The local applications were also identical, being lotio alba or the similar paste-like cream. In a few instances other factors, such as iron or hydrochloric acid, were added because of an existing anemia or digestive disturbance. Of those receiving viosterol the dosage was started at twenty drops each morning. Of these, in many patients the dosage was later increased to forty drops. Eighty drops a day were used on two patients. The reason for the morning dose was to take advantage of the influence of sunlight on the synthesis of vitamin D in the skin.

By testing, I found that the average dropper delivers about thirty drops to a cubic centimeter. The patient received twenty to forty drops daily, a few receiving eighty. The dosage averaged probably 5,000 to 14,000 units at a dose. Those on the higher dosage may have healed more promptly in a few instances.

It is unfortunate that on starting the use of viosterol I did not expect the good results I later observed. I, therefore, have had to rely on a tabulation made from my remarks on each patient's history. I believe, however, that, if anything, they belittle the actual results, as my satisfaction with the procedure has been complete.

I am not going to present this long series of cases because the tabulation would be boresome to you. If any of you are interested in surveying the charts, they are available. The following data were kept on all these cases: age, duration, sex, menstruation, constipation, physiological factors, local treatment, general treatment, dosage of viosterol, x-ray treatment, observation at one month, observation at three months, total observation, and final remarks. Specimen tabulation is seen on this slide. The results of this tabulation are as follows:

Table 1.—*Patients Treated With X-Ray Without Viosterol*

Not noted one month	12		
Unimproved at one month	45		
Better at one month	29		
Unimproved at three months	17	20%	
Better in three months	30	35%	
Much better in three months	13	15%	15%
Healed at three months	26	33%	33%
Satisfactory in three months			48%
Healed, final note	56	63%	
Relapsed	21	25%	
Unsatisfactory throughout	20	23.3%	
Total number of cases treated with x-ray			86

TABLE 2.—*Patients Treated With Viosterol*

Not noted one month	0		
Unimproved at one month	6		
Better at one month	87		
Much better at one month	38		
Healed at one month	1		
Total cases viewed at one month	132		
Unimproved at three months	10	14.2%	
Better at three months	8	10.2%	
Much better at three months	20	28.5%	28.5%
Healed at three months	32	47.1%	47.1%
Satisfactory in three months			75.6%
Total viewed at three months	70		
Unfavorable on viosterol	2		
Viosterol cases requiring x-ray	3		
X-ray advised at the first visit found to be not necessary later	9		
Relapsed	1		

It is interesting to note in this series that 100 per cent more patients failed to return after one visit, when x-ray was advised, than when viosterol was prescribed. It will also be noted that I have made a direct comparison only with cases treated with x-ray; the only difference in treatment in this series being through the use of x-ray in one series, and viosterol in the other. Although the number of cases surveyed was considerably greater than those shown, the elimination of the non-x-ray cases has brought the total down to 204.

SUMMARY

I believe I may say that at no time in my dermatological experience have I felt such complete satisfaction with a treatment as I have with the cases of this series. I know that vitamin D is an imperfect weapon to slay this disfiguring disease, but it undoubtedly gives one a feeling of being well defended. From the patients' viewpoint, it has left little to be desired, as they find themselves improving, both in appearance and in general well-being. Many have expressed the sentiment, "Never felt better."

IN CONCLUSION

Briefly, I wish to mention some fortunate side-observations in patients presenting other skin diseases. Two cases of localized scleroderma healed completely. Three patients with alopecia areata grew their hair without other treatment. Psoriatics gave me the impression of improving more rapidly. One patient, a generalized exfoliative case of this disease shown to the San Francisco Dermatological Society at the height of eruption, has stayed well without a spot for a year. One case of old x-ray atrophy improved 100 per cent, and one severe pernio was similarly relieved. Three out of four cases of granuloma annulare healed completely.

I recognize that there is much that is intangible in this paper, as personal impressions are apt to be erroneous if enthusiasm is a persuading factor. I have, therefore, examined very critically those cases that were seen before viosterol was being regularly prescribed, and was given only where a "tonic" was considered to be good "policy." The results in these instances were the cause of my future enthusiasm. I have also recorded, in many instances, the enthusiasm of the patients, especially in letters received later. The percentage of cures and marked improvement is still low. Perhaps the dosage is not optimal, or that large doses of calcium should also be used. The other vitamins may further add to success. The wrong tree may have been chosen to bay around and another factor of greater importance missed. I believe that all these things are to be weighed, and that time and usage will bring this out. It is my intention to attack these problems in turn, and hope to report again when a sufficient number of cases have accumulated.

DISCUSSION

GEORGE V. KULCHAR, M. D. (450 Sutter Street, San Francisco).—The well-controlled series reported by Doctor Maynard suggests that large doses of vitamin D are more effective in the treatment of acne than x-ray. The percentage of satisfactory results, both immediate and permanent, secured with roentgen therapy in his series is considerably less than that usually obtained, and may be due to the most severe cases requiring x-ray therapy. Most observers report from 80 to 95 per cent of satisfactory results with roentgen therapy (McKee, Andrews), and less than 10 per cent of relapses. Unsatisfactory results, including relapses, are due usually to inadequate dosage. By careful preliminary testing, adjustment of dosage, and watching for early evidences of reaction, x-ray therapy in most instances can be carried out to 1200-1500 R doses without injury to the skin. It remains our most effective treatment for acne.

The acne form dermatoses result from a disturbance of the pilosebaceous apparatus. This may be due to external irritation from oils, tars, or gases, or hematogenously by allergens, products of the tubercle bacillus, or the halogens. Their effect on patients with acne vulgaris is well known. It is reasonable to suppose, as Sulzberger and others have suggested, that some hormonal stimulation of the pilosebaceous apparatus, resulting in the comedone formation, is an important factor in the genesis of acne. The persistence of activity in the sebaceous gland, an invagination of the epidermis, with the secondary invasion of bacteria, results in the acne lesion. Similar keratinizing metaplasia in the pilosebaceous apparatus has been reported by Lowenthal and by Frazier, and Hu in vitamin A deficiency, with the production of comedones over the face, and in numerous instances acne which disappeared on restoring the vitamin A content of the diet to normal. The histological similarity of the lesions reported by these observers to the involuting acne lesion is striking.

Because of this I have used vitamin A in 55,000 unit doses daily, in addition to amounts of D equivalent to those used by Doctor Maynard. My patients have not been so well controlled and many received x-ray therapy in addition. Aside from the "tonic" effects, I have been impressed with its value. However, the percentage of satisfactory results in patients not receiving x-ray have been considerably less.

The combination of vitamin A with D may have the advantage, as suggested by the laboratory studies of Gross-Selbeck, of decreasing the toxicity of the latter.

It is only through such well-controlled and extensive studies as Doctor Maynard has made that effectiveness of

vitamin therapy in management of acne, where so many factors are involved, can be determined eventually.

☙

Henry J. Templeton, M.D. (3115 Webster Street, Oakland).—Several years ago I treated a few cases of acne by means of viosterol. Because of failure to note improvement, I abandoned the treatment. I must state, however, that I kept no careful records of my results and that I did not control the experiment. Moreover, my dosage was five to ten drops a day, which may have been inadequate.

Having heard Doctor Maynard's interesting results dealing with a large series of cases, and feeling the need of something to supplement the one remedy that I believe is of definite value, namely, x-ray, I will resume viosterol therapy in selected cases.

As Doctor Maynard has stated, any favorable action of viosterol on acne might well be due to its influence upon the calcium metabolism. We can recall that calcium has been claimed to have been of value in acne when given intravenously. The well-recognized fact that sun baths are of value in acne may be due to their synthesis of viosterol in the skin. What relationship this bears to the pigment-producing mechanism of the skin, I do not know; but it is my experience that the value of sun bathing and ultra-violet light therapy (excluding cases treated by heavy exfoliating doses) is directly proportional to the amount of tanning produced. Acne in the blond patient who freckles and peels but who cannot be tanned, does not respond as well as in the brunette. I should like to ask Doctor Maynard as to whether or not he has noted any difference in results in blond or brunette patients with viosterol?

☙

Nelson Paul Anderson, M.D. (2007 Wilshire Boulevard, Los Angeles).—Doctor Maynard has given us the result of his experience in the therapy of acne vulgaris with vitamin D. This line of therapy should especially appeal to the physician who is continually requested by acne patients to prescribe some general tonic or blood medicine. It would seem advisable, however, to remember that, from a scientific standpoint, the most satisfactory results in medical treatment are those developed for conditions whose etiology is known. In other words, all rational therapeutics is based upon cause. Our knowledge of the etiologic background of acne certainly leaves much to be desired. Personally, I feel that the true etiology of acne has an endocrine basis, but am perfectly frank to admit that at present all treatment of this nature has been unsatisfactory. It may well be that vitamin D, in its regulation of calcium and phosphorous metabolism, also effects changes in the endocrine glands, and that these functional changes in turn act upon the sebaceous glands which are involved in acne vulgaris. The fact that vitamin D apparently benefits acne vulgaris is to me of much less importance than the question of how it produces its benefits.

TRAUMA AND MALIGNANCY*

By Edwin I. Bartlett, M.D.
San Francisco

Discussion *by George D. Maner, M.D., Los Angeles; Alson R. Kilgore, M.D., San Francisco.*

A BELIEF that malignant disease may result from trauma is so prevalent that approximately 100 per cent of the laity and most of the profession have come to look upon trauma as a causative factor. Not many years ago not only the ignorant, but the majority of the more intelligent classes accepted without question trauma on the head in infancy as the cause of insanity. Today trauma as a causative factor in malignant disease is accepted without question, and the doctor is "on the spot" indeed if he is so careless as to express an opinion to the contrary. In taking histories on patients with malignant disease, invariably the patient volunteers the information regarding the trauma which caused the disease. Occasionally, when the patient is unable to remember a particular trauma, he apologizes for being so ignorant and unobserving. Where these ideas come from it is not altogether clear, but they must originate, in part at least, from the rather loose teachings of former years, and court decisions too often based upon the rather glib testimony of members of our profession. Of more recent years the profession itself, in the more scientific circles, have come to the realization that there may not be such a close relationship, and has learned to approach the subject with an open mind. The courts also have become awakened to the situation, and have accepted certain rules and regulations laid down by the students of pathology of tumors.

CAUSATIVE FACTORS OF MALIGNANT DISEASE

A study of this problem leads one immediately to the consideration of the causative factors of malignant disease. There are many interesting theories, the most popular, today, being that there is a loss of control or balance among the cells of the body. This loss of control might be a change in the particular cell which enables it to escape from under inhibiting influences which normally keeps it in place, or it may be the loss of the inhibiting properties of cells which maintain control, thus allowing a cell with normal growing tendencies to proceed to develop without any inhibitions at all. Granting that one or the other of these theories is correct, we are then led to the consideration of how this comes about. Investigations in this direction have favored a general acceptance of the theory that there is a change in the physiology of the body, probably chemical, which makes an individual susceptible to the development of malignancy, or there is the existence congenitally to some unbalance in the physiology of the body. But this does not explain why a malignancy should develop at any one particular place. To answer this question, one must seek for some strictly localizing determining factor, or tissue disturber. Trauma being the commonest and an easily understood tissue disturber, one would naturally look upon injury to tissues as the most likely factor in determining the exact site of the malignant development. When one considers, however, the very great frequency of traumas, many of them violent in the extreme, and the relatively infrequent instances of malignancies, one must approach the subject with only the greatest of misgivings, and with the mental admonition to exert extreme caution lest one be led astray.

SINGLE DIRECT VIOLENCE AND MALIGNANT DISEASE

The relationship of the single direct violence with the development of malignant disease for many years was admitted, but in recent times, beginning with the critical analysis of James Ewing and his about-face, the pendulum has swung to the other extreme, and students of this subject are of

* Read before the Industrial Medicine and Surgery Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

the opinion that very rarely indeed do the facts bear out a scientific conclusion that the single direct violence is a factor in any sense in the development of malignant disease.

REPEATED TRAUMA AND MALIGNANT DISEASE

The relationship of repeated trauma to the development of malignant disease must be admitted, especially if one includes under the heading of trauma, long-continued irritations by chemicals, etc. Repeated direct violence possibly does result in rare instances in malignancy. One instance in the author's experience of repeated direct blows to the nipple, in a male of cancer age, was associated with the development of a cancer of the breast at the end of an approximate five-year period. The rarity, however, of such an occurrence should definitely limit the development of malignant disease from this cause to a rare occasional occurrence, and there should be in the history a record of continual soreness or repeated abrasions to the skin, or other evidence that the trauma was causing disturbance in the tissue at the exact site of trauma.

STIMULATION TO MALIGNANT GROWTH

The stimulation to a more rapid growth and possibly to a more primitive or malignant type of lesion by trauma, single or multiple, cannot be denied, inasmuch as it has been repeatedly observed that cutting into a malignant disease produces almost immediate increase in local spread and early metastasis. This stimulation to more rapid growth must be in the nature of an opening of channels for the escape of cells locally or into the circulation, and an increased vascularity attendant upon the reparative process which follows the wounding of tissues. Trauma may accomplish this stimulation to malignancy, therefore, provided there is a break in the continuity of the tumor and surrounding tissues, or provided it constitutes a major form of irritation which produces a high degree of vascularity. Obviously, therefore, minor traumas in this connection cannot be taken into account, and the major traumas only can be considered.

The stimulation of benign tumors to become malignant must also be admitted, provided a given benign tumor is capable of becoming malignant. For instance, a benign pigmented mole invariably takes on malignant changes following any form of trauma which interrupts the integrity of the surrounding tissues or sets up an inflammatory reaction among the normal surrounding tissues. Also an intraductal papilloma of the breast, which sooner or later becomes malignant, might take on malignant degeneration when the requirements above mentioned are fulfilled.

Among the bone tumors there is one, and probably only one benign condition which may be excited by severe trauma, and that is the chondroma. Such a tumor, either central or external, has a strong tendency in middle age to take on a more primitive form and malignant invasion. In earlier life, however, such tumors may spread locally, but maintain the same type of adult cell wherever the cartilage cells become spilled into surrounding tissues, or wherever there is a break in the wall of the surrounding tissues through which the cells may wander. Trauma, therefore, must be considered in this type of growth when all the requirements are met and the age of the patient is favorable.

MEDICO-LEGAL PHASES

From the medico-legal standpoint in any given case there have been set up certain requirements which must be met in order to establish a reasonable supposition that trauma has played a part in the malignant process in question. These requirements have been discussed at great length in innumerable contributions, and the subject is so well known to every member of the profession that the enumeration of these factors would be superfluous. On the other hand, a limited discussion of each point, from the standpoint of the scientific value, might not be amiss in the view of the obvious confusion which exists in the minds of the profession regarding the value of each point in drawing medical scientific conclusions.

In order of their importance, one would place, first, a positive diagnosis of the presence and nature of the tumor. While it may seem absurd to lay emphasis on this point, all too frequently cases come up for discussion which have been the subject of lengthy reports and have even come up before the courts without positive proof of the nature of the tumor. Not always is a tumor mass a malignancy. It may be benign, or it may be a secondary tumor transplanted from some distant focus, or it may be a tumor which, because of its nature, could not possibly have been related in any way to trauma.

The integrity of the wounded part prior to the alleged trauma must be established. This requires that the evidence must be indisputable. Not infrequently a woman of cancer age comes with a tumor, and a history of trauma which she believes was the causative factor, because she did not find the tumor prior to the trauma. Investigation reveals a fair-sized carcinoma which could not possibly have developed in the few hours, days, or weeks following the trauma. Another illustration is the injury to a limb: x-rays taken as a routine for the possibility of a fracture reveal a bone cyst. No relationship can be possible, regardless of the history, inasmuch as the man is thirty-five, and these tumors do not develop after twenty.

The authenticity and adequacy of the trauma is not a problem for the doctor. The history must show a mark, or the development of an hematoma or the development of an ecchymosis, or some equally indisputable finding to prove the exact site of trauma. A minor trauma could not produce this picture, so the trauma must be far above the average in severity.

The tumor must develop at the site of the trauma and not at some distant part. This fact is obvious to the most primitive minds, and yet there are many instances related in the literature of attempts to establish a relationship of trauma on one part of the body to tumor development at another site. The only possible way in which there could be a relationship is through the trauma acting in the capacity

of an agent, which alters in some way the body's general resistancy to malignancy. Such a change in the chemistry or physiology which results in a nonresistant individual has never been proved. Even a trauma—physiological, chemical, mental or otherwise—which produce very marked changes, such as loss of weight, weakness, anemia, or any other gross debilities, cannot, even as a secondary factor, be related to malignancy developing elsewhere in the body.

The interval between the time of injury and the appearance of the tumor can only be of significance when it coincides with the microscopic findings. The same is true as regards the rate of growth. A slow-growing tumor of low malignancy cannot be fitted into a history of a tumor appearing within a week or two after trauma. On the other hand, a rapidly growing tumor with primitive cells cannot fit into a history of a tumor developing a long time after trauma. This last point is the most difficult problem of all for the medical man to decide, provided the chronological history is indisputable. Perhaps no one is capable of answering this question correctly in every case, but surely the only one capable of even approximating the truth is the man who has had a great deal of special training in all forms of malignancy.

In the event of a doubtful or a not positively proved instance, responsibility must lie with the patient. Without positive proof, scientific conclusions are valueless and are never accepted as scientific factors, and as doctors and scientists, at least nominally, it is our duty to judge in these medico-legal situations from the purely scientific standpoint. We are not the judge nor the jury. We are simply witnesses. While it invariably is true that our sympathies are with the patient, and while we may feel as the majority of the human race feels, that the individual should have the advantage against a corporation, still we have no right to allow our prejudices to influence in any way our scientific conclusions.

In spite of the truth of these facts, which I am sure everyone present will admit, we must confess that too many of the medical testimonies are based on other than scientific conclusions. This is because some members of our profession will testify to almost anything to help win a case to satisfy the ego or to collect a fee. Some of us are just too human, and are constitutionally unable to allow our minds to draw conclusions unbiased by our sympathies. A large majority of us are simply trying to solve scientific problems without the proper scientific background. There never will be a remedy for this situation until it is recognized by our profession and by the courts that there is a difference in value in the testimony of scientific import. Perhaps it is not too optimistic to look forward to the time when our profession will consent to the selection of a panel of competent scientists, and the courts will recognize these individuals and no others, as the proper authorities for testimony where these scientific matters are involved.

490 Post Street.

DISCUSSION

GEORGE D. MANER, M. D. (657 South Westlake Avenue, Los Angeles).—This discussion shall be confined to the causal relationship of single trauma to malignant tumors: for the question of the relationship of repeated or continuous trauma to neoplasm is too complex to be adequately debated in so short a time. To those interested in the subject it is suggested that they consult the excellent résumés of Ewing, Mock and Ellis, Knox and others.

Unfortunately, there exists in the mind of the profession considerable confusion as to the causal relationship of single trauma to malignant tumors; this is probably because the earlier concepts were based mostly upon clinical observations. As our knowledge relative to the natures of malignant tumors and their natural history advances, it behooves us to revise these concepts and apply more strict scientific criteria.

It is the unanimous opinion of competent pathologists that single trauma never produces a malignant tumor in previously normal tissue. There is no conclusive experimental evidence that a single trauma either can aggravate or stimulate the growth capacity of a malignant tumor, determine its metastatic dissemination or fix the site at which metastases may eventually localize.

This subject is one of vital importance to industrial surgeons because of claims "based upon" tumors allegedly developing after injury. For their information the postulates of Mock and Ellis are listed:

1. Reasonable proof of a trauma of sufficient seriousness to cause definite tissue changes: (*a*) the injury must be reported within a reasonable period after its occurrence. (*b*) The examination and condition of the traumatized tissues must be reported by a physician within a reasonable period after the injury.

2. The developing neoplasm must be at the same site as the original injury, and must involve some of the tissue which, without reasonable doubt, could have been involved in the original trauma.

3. Definite evidence must be produced to prove that no neoplasm existed at the site of the injury prior to the accident.

4. In addition to the history of trauma, there must be a history of definite bridging signs, such as persistent swelling, an unhealed wound, or additional anatomical disturbances which connect the trauma with the malignant growth; subjective symptoms, such as complaints of pain, tenderness or weakness, are impossible to evaluate or visualize and, therefore, must not be considered competent evidence.

5. The time which has elapsed between a given trauma and the development of a malignant tumor need not be considered, if the foregoing conditions have been present; however, it is safe to say that a malignant tumor that develops within two weeks after trauma existed prior to it.

6. A preëxistent malignant tumor may be aggravated or accelerated in its growth by a trauma, or the trauma may be the first factor to call the patient's attention to the tumor. Treatment should be instituted at once to eradicate the tumor, or at least to prolong the patient's life. Under our present laws, which provide for compensation in case of aggravation of an existing condition by trauma, the employer or his insurance company would be held responsible for this treatment, provided aggravation could be shown, and would be forced to pay for the permanent disability that might follow. He should not be held responsible for the subsequent death of the patient due to malignancy, for the trauma could not aggravate to the point of fatality a preëxistent condition which already positively doomed the patient. Nor should he be held responsible for hastening the death, for this point could only be one of speculation on the part of the medical profession.

7. In the case of a metastatic or secondary tumor developing at the site of trauma, the first four postulates must be met before the employer is held responsible, and such responsibility should be limited to the treatment of the local condition; it should not be extended to include responsibility for the death that is bound to occur shortly, as the trauma could not have aggravated the primary growth.

*

ALSON R. KILGORE, M. D. (490 Post Street, San Francisco).—Until the actual cause of malignancy is demonstrated we shall probably be unable to prove positively that

mechanical injury (as distinguished from chemical or other forms of injury) has nothing to do with it. But I think we must agree with Doctor Bartlett that the trend of informed medical thought is more and more toward this conclusion. Mechanical injury is extremely common and the incidence of malignancy following it so small as to be explainable on the basis of coincidence. It is ignificant that no authentic case of skin epithelioma following a single blow has been observed. And the modern knowledge that carcinogenic agents must act over long periods of time makes it appear highly unlikely that a single blow can have any relation to tumor origin.

About stimulation to more rapid growth and metastasis—it is true that incision into certain forms of tumor, or incision through them into healthy tissue, will cause more rapid growth and spread; but it is worth emphasis that incision and contusion are by no means comparable. Experimental evidence has shown that mechanical crushing or contusion of tumors is as likely to be followed by regression as by increased growth.

BELIEVE-IT-OR-NOTS IN UROLOGY*

By Wirt B. Dakin, M.D.
Los Angeles

Discussion *by Robert V. Day, M. D., Los Angeles; Carl Rusche, M. D., Hollywood; Edward W. Beach, M. D., Sacramento.*

WHILE trying to deliver a large hypernephroma, its attachment suddenly gave away, and the large kidney tumor rolled off onto the floor and, after several bounces, came to a halt in the supply room. Doctor Ballenger says, "We dodged, and expected to see a fountain of blood, but we have yet to see the blood. There was an uneventful recovery."—*Edgar G. Ballenger,* Atlanta.

* * *

A girl, aged fourteen, had a ureter inserted in the fibers of the vesical sphincter, causing pyoureter and pyonephrosis, which had formerly been diagnosed as pyelonephritis. Voided specimens contained pus, whereas catheter samples were always without pus. Explanation: Pus got out of the aberrant ureter only while the vesical sphincter was relaxed during urination. — *Charles R. B. Crompton,* Toronto.

* * *

A patient, aged seventy-two, sought relief from mild indigestion. Abdominal palpation revealed a large, hard tumor on each side of the abdomen. Routine gastro-intestinal series showed perfect casts of the pelvis and calices of each kidney from extensive calculus formation.—*Archie L. Dean, Jr.,* New York.

* * *

This contributor states that, of all classes of people, musicians are the most susceptible to urinary calculi. He believes that this is undoubtedly due to the fact that they avoid drinking water before working hours, so as to keep the bladder empty.—*Ralph L. Dourmashkin,* New York.

Eighteen days after a nephrotomy for kidney abscess, the entire kidney came out through the wound: autonephrectomy. — *Wilbur H. Haines,* Philadelphia.

* * *

For a year and a half, a patient had pain in the right kidney region, accompanied by chills, fevers, and pus in the urine. He had been operated at the beginning of the symptoms for appendicitis. Two days later the symptoms returned, and a diagnosis of renal stone was made; the stone was thought to have passed, but the symptoms persisted. A diagnosis of pyelitis was made by another physician, and then the patient came into the hands of the contributor of this unusual case. Briefly, an examination revealed a kidney almost functionless on the affected side, with a marked hydronephrosis. At the nephrectomy, unusual difficulty was encountered in severing the ureter, and much to the amazement of the surgeon, a Garceau catheter was found to have been lost by someone, and the cause of the patient's illness was discovered.—*Nathan G. Hale,* Sacramento.

* * *

A traumatic rupture of a solitary kidney was treated successfully without operation. Later studies revealed that it was the only kidney.—*Augustus Harris,* Brooklyn.

* * *

A patient had a kidney stone with a wooden toothpick as a nucleus. He stated that he often chewed toothpicks, and the doctor believes that it may have sloughed through from the bowel.—*Herbert H. Howard,* Boston.

* * *

Anuria, after a hysterectomy, was treated with diuretics for four days, but no urine. Cystoscopy, even with indigo carmin, failed to reveal any ureters. There were no signs of uremia, but on the twelfth day, when the surgeon was about to interfere operatively, and when he was undoubtedly about crazy, one more diuretic was tried, namely, salyrgan. That night, 4,000 cubic centimeters of urine passed. Believe-It-Or-Not, the patient was at no time very uncomfortable.—*Michele V. Iovine,* New York.

* * *

New stones formed, with severe colic, three months after operation. They were again removed and in two weeks there was another severe renal colic, and the x-ray showed new calculi forming. Two months later, five different shadows in the pelvis were seen on the x-ray plate, and two in the lower calyx. Three months later, almost six months from the last operation, several additional calculi were found on the x-ray plate. From then on, a series of x-ray examinations revealed the astonishing fact that the patient was forming *a calculus a week.* The kidney function was good, there was a tendency to fusion of the calculi, no further colic, and additional surgery was deemed inadvisable until later, when a nephrectomy would undoubtedly be necessary.—*Joseph A. Lazarus,* New York.

* Title used by special permission of Robert Ripley.

The author is indebted for each anecdote to the doctor whose name follows each paragraph.

Read before the Urology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

X-ray showed an apparent stone shadow, which indicated operation. The operation was twice deferred, and the cause of the x-ray shadow was found to be a nonpigmented mole.—*Gordan F. McKim and Parke G. Smith,* Cincinnati.

* * *

A woman simulated a kidney colic and claimed to have passed a stone. She carried her own calculi; they were pieces of brick, fusiform in shape. Believe-It-Or-Not, examination revealed that she actually had a stone in each kidney pelvis.—*Nelse F. Ockerblad,* Kansas City.

* * *

A patient passed a giant ureteral calculus, nearly two inches long and one inch in diameter, weighing six and one-quarter grams. The process evidently consumed several years, and the patient had no morphin or cystoscopic treatments to help him. The stone was removed from the bladder by a cystotomy, and the patient apparently was none the worse for the experience.—*W. T. Briggs,* Lexington, Kentucky.

* * *

The severing of a ureter during hysterectomy was not recognized at the time of operation. Extravasation resulted, with infection. The ureteral plight was diagnosed with retrograde injection of opaque solutions into the ureteral orifice. The extravasation was drained by lumbar incision, but nephrectomy was impossible because of the patient's poor condition. But, Believe-It-Or-Not, the patient recovered completely, and later cystoscopic study revealed spontaneous anastomosis of the ureter.—*Ralph L. Dourmashkin,* New York.

* * *

A patient had a large ureteral stone with colics for three years. She refused to let anyone in America operate on her. Finally, she traveled to Berlin to see Israel, but, on the cart going into the operating room, she passed the stone.—*William G. Exton,* New York.

* * *

A prostatic, aged one hundred and one, upon being brought to the operating room, seemed to be much worried and quite uneasy. Upon being questioned, he stated he was upset that morning and wished to defer the operation. He was disturbed about his "boy," he said; he had just received word that he was ill with pneumonia. The urologist asked, "How old is your boy?" and the patient answered, "Eighty years old."—*A. E. Goldstein,* Baltimore, Maryland.

* * *

A patient with symptoms, supposedly of appendicitis, upon being cystoscoped, revealed a date-sized stone protruding from the *left*—not the right—ureteral orifice. Stone removal cured the appendicitis.—*Julius W. Kleinbochl,* Milwaukee.

* * *

A man with a ureteral calculus had a ureteral catheter passed, left in place a short time, and, upon withdrawal, the ureter was lubricated with oil. The patient was told to report to the office in a week. He did, and while telling the doctor he had been without symptoms, he was voiding in three glasses. The patient's stone passed in the third glass and he has always believed that the doctor loaded the glass.—*Sidney Olsen,* San Francisco.

* * *

A girl with typical appendicitis symptoms for four months had urine containing a few pus cells. The right ureter was investigated, and found to have a stricture with a hydronephrosis. With dilatation, all symptoms disappeared. — *William E. Stevens,* San Francisco.

* * *

A bladder tumor looked cystoscopically like a gumma. A Wassermann was four plus positive. Luetic treatment was advised, and the bladder growth was to be observed from time to time. One month later, an intestinal obstruction developed; laparotomy revealed the ileum attached to the bladder. In freeing the mass, an abscess was opened, which contained a gauze sponge that must have been left there thirteen years before. The abscess communicated with the bladder. Death followed five days later. The bladder tumor was really a granuloma.—*James F. Balch,* Indianapolis.

* * *

A man, aged thirty-five, had had urinary difficulty for over a year, and for six months had been obliged to use a catheter. There was always intense pain before and during an attempt to void. His previous examinations by several doctors had included urethroscopic and cystoscopic observation, and the case puzzled everyone. Finally, additional consideration included a Wassermann. This was positive, and he was placed immediately on intensive treatment. He began to feel better the same day; in four days he urinated normally, and has had no further difficulty.—*Wirt B. Dakin,* Los Angeles.

* * *

Cystoscopy revealed a large stone in the vault of the bladder suspended from a suture. It somewhat resembled a swinging ceiling lamp.—*Ralph L. Dourmashkin,* New York.

* * *

A patient with incontinence for twelve years refused to wear a urinal, and had used a wooden screw in the external urethral orifice. This orifice was thick, and threaded to fit the wooden plug.—*William G. Exton,* New York.

* * *

During a litholapaxy, a Ravich instrument jammed, and the operator was obliged to do a cystotomy to remove not only the stone, but the instrument as well.—*Abraham G. Fleischman,* Des Moines.

* * *

A woman had been treated for thirteen years by a physician, and with home remedies. Finally, ad-

mittance to the hospital revealed that she could not be catheterized. Diagnosis: A calculus the size of a fetal head, filling the entire bladder.—*C. W. Louis Hacker,* Albany.

* * *

A two and one-half pound bladder stone was removed suprapubically.—*H. Fay H. Jones,* Little Rock.

* * *

A woman of sixty-five had had five unsuccessful operations to close a vesicovaginal fistula. She entered the hospital with severe pain in the left abdomen. She had a large stag-horn calculus in the left kidney, and voided all urine through the fistula. She refused any operative interference. One year later she reëntered the hospital with dysuria and pain in the bladder. She had not passed any urine through the fistula in several months. Cystoscopic examination revealed a collar-button calculus in the fistula, which closed it quite effectually. A small loose calculus was removed from the bladder. She appears from time to time for removal of small loose calculi. —*Louis Orr,* Orlando, Florida.

* * *

A gauze sponge, overlooked during a salpingectomy, sloughed into the bowel and thence into the bladder. It was removed cystoscopically, and catheter drainage was employed for two weeks, with a cure. At first, fecal matter passed through the catheter.—*C. H. deT. Shivers,* Atlantic City.

* * *

A douche nozzle, six inches long and one-half inch in diameter, was removed from a woman's bladder. The lady insisted that she had swallowed it.—*Frederick H. Cole,* Detroit.

* * *

A patient with a large prostate had a foreign body in the bladder. X-ray was negative, but cystoscopy revealed some sort of a foreign body encrusted with lime salts. Cystotomy was performed, and the body was found to be a piece of the illustrated section of a newspaper. Upon unfolding the paper and brushing off the salts, the picture of a beautiful nude woman was revealed.—*Ernest G. Mark,* Kansas City.

* * *

A porcupine quill was evacuated from the bladder during an irrigation. The University of California Biological Laboratory stated that it was not only a porcupine quill, but one from the tail of the beast, and submitted two quills to prove the assertion. The patient explained that while out for a walk with her dog, he had engaged in a battle with a porcupine, and in her endeavor to separate the animals, she had received several quills in her leg.—*Albert M. Meads,* Oakland.

* * *

A husband, in endeavoring to take his wife's temperature per vagina, lost the thermometer in the bladder. The doctor cystoscoping the case, because of the favorable position of the thermometer, was able to read the temperature through the cystoscope. When this was observed, the doctor said to the husband, "Since you are so damned anxious to know what this girl's temperature is, I can tell you. It is 99.6 degrees." This is a new method of taking temperature—cystoscopically. Believe-It-Or-Not.—*H. W. Scott,* Fort Dodge, Iowa.

* * *

A stone containing a gold watch chain was removed from the bladder. The case was diagnosed cystoscopically as a vesical calculus, and roentgenologically as a stone containing a watch chain as a nucleus.—*Fedor L. Senger,* Brooklyn.

* * *

A woman sat on the porch darning socks. She put the needle into her mouth to get some more thread. Her sister made a funny remark, she opened her mouth to laugh, and swallowed the needle. For months she had severe pains in her stomach, and then only occasional pains in various parts of the abdomen. Seven years later she began to have frequent and painful urination. I passed a cystoscope, saw the needle sticking into the bladder, caught it with forceps and removed it through the urethra, with complete relief of pain.—*Hugh H. Young,* Baltimore.

* * *

A patient, fifty-nine years of age, had had a celluloid ball in the scrotum for thirty-four years without symptoms. It had been placed there at the time of an orchidectomy for cosmetic purposes.—*Benjamin S. Abeshouse,* Baltimore.

* * *

A patient who was a religious fanatic, castrated himself with a pocket knife. He nearly bled to death before the doctor arrived and ligated the vessels. The patient justified his act with a well-known quotation from the Bible.—*John E. Hall,* Miami.

* * *

A new etiological factor in nonspecific urethritis: a patient tried passing an icicle in lieu of a sound.—*James B. Cross,* Buffalo.

* * *

A man, aged sixty-two, had had very tight anterior urethral strictures for years. Dilatations had become so painful, and results so unsatisfactory, that in desperation he amputated his scrotum and penis with a razor. Bleeding was controlled by an ordinary piece of cloth. Three days later, when the doctor first saw the patient, his condition was good. Since the operation he had voided without difficulty through the perineum. He appeared to be normal mentally, and explained that so long as he was impotent anyway, the operation seemed to be the best way out.—*Alexander H. Peacock,* Seattle.

* * *

A traumatic urethrorectal fistula was discovered at cystoscopy. Treatment, expectant; result, cured. —*A. G. Rytina,* Baltimore.

Years ago, an organ grinder in Barnum and Bailey's circus consulted the doctor because of a penile ulcer. The patient explained that, because of his occupation, he had been unable to carry out the proper treatment. At his own special request, he was allowed to remove the adhesive plaster and several yards of bandage. Before completing the job, bandage, penis, and all came away. He looked pitifully at the lower part of his abdomen, and all he said was, "It's too bad, isn't it?"—*Edgar G. Ballenger,* Atlanta.

* * *

A patient with severe pain in the right side had some urinary disturbance. X-ray showed a dense shadow about the line of the pelvic right ureter. Ureteral catheter passed in contact with the shadow, which was denser than the usual urinary stone, and of unusual shape. Believe-It-Or-Not, the operation revealed a dermoid cyst of the right ovary, containing one tooth, fully formed except for the roots.—*R. Campbell Begg,* Wellington, N. Z.

* * *

A papilloma of the skin caused a shadow on the x-ray plate to be erroneously diagnosed as renal calculus.—*William R. Delzell,* New York.

* * *

A dermoid cyst was removed from behind and slightly above the bladder. It had cast a shadow on the x-ray plate, and was thereby very nearly mistaken for a vesical calculus.—*William S. Ehrich,* Evansville, Indiana.

* * *

An aneurysm of the internal iliac artery was very nearly opened by mistake for a distended bladder.—*A. W. Hunter,* Vancouver.

* * *

John, aged seventy, had a prostatic resection and left the hospital on the sixth day, returning to his hotel. Not having heard from the patient, and being somewhat concerned about him, the doctor called at his rooms the next day, only to find a strange woman in bed with him. John is now treating for gonorrhea, and seems proud of the fact that he was capable of acquiring it under such adverse circumstances.—*W. Ray Jones,* Seattle.

* * *

Doctor Kearns reports what he believes to be an autoprostatectomy. Rectal examination revealed an enlarged prostate. There were toxic symptoms of diabetes and two quarts of retention. Catheterization and insulin therapy were instituted at home. There was an abscess of the epididymis with evacuation of nearly a quart of pus. Two weeks later there was acute prostatitis, high fever, chills, and intense perineal pain, but the patient continually refused hospitalization. After eight days of this, there was a spontaneous rupture of the abscess into the bladder, and voiding of large amounts of pus, followed by relief. He was observed during the next five years, with no urinary symptoms; the prostate was small and firm. He died at the end of five years from diabetic coma.—*Walter M. Kearns,* Milwaukee.

* * *

Doctor Player reports an unbelievable expense from an industrial accident case. A crushing injury resulted in, among other things, paraplegia and loss of both anal and vesical control, necessitating retention catheters. This condition existed for fifteen years, until the patient died of a pyonephrosis. Believe-It-Or-Not, his hospital expense was almost $25,000; nursing expense, nearly $15,000; and doctor bills, nearly $4,000: a grand total of over $43,000.—*Lionel O. Player,* San Francisco.

* * *

Doctor Pomeroy once had a patient by the name of O. Bills, and, Believe-It-Or-Not, he never paid one.—*Edward S. Pomeroy,* Salt Lake City.

* * *

An old negro with carcinoma of the testicle was advised operation, but refused. After listening to possibilities and probabilities, he scratched his head and said, "Boss, does Ah git you right—if Ah isn't operated, dis ole nigger is goin' to die, and if Ah is operated, Ah, don' live much longer nohow?" Upon being told that this was about the case, he replied, "Well, let's jes' leave 'em on then, for looks' sake."—*Jesse U. Reaves,* Mobile, Alabama.

* * *

A woman with urinary symptoms showed a wire hairpin in her bladder with a plain x-ray. Cystoscopy was negative. A second x-ray film showed the pin in the same position. Vaginal and rectal examination was negative. Explanation: The cassette used with the first two x-rays had a hairpin stuck on some adhesive cement. With the third film, a different cassette was employed.—*Clarence C. Saelhof,* Chicago.

* * *

A woman with a marked degree of frequency, all of whose urological examinations were negative, was relieved in a most unusual way. Noticing in a medical journal an article by an eye specialist, who claimed he had relieved many cases of frequency by refracting the patient's eyes, Doctor Sargeant thought he would try it on his patient. Only a moderately defective vision was found, but she obtained relief. He would have her leave her glasses off for a few days, and the frequency would always return.—*James C. Sargeant,* Milwaukee.

* * *

An imperforate hymen in a girl, age thirteen, caused a retention of twenty-five and one-half ounces of menstrual fluid, and this, in turn, symptoms of a kidney or ureteral condition. Cystoscopy and x-ray examination demonstrated pressure on the left ureter, with a temporary hydroureter. A general surgeon decided that it was a pyonephrosis, and advised that the left kidney should be drained for five or six weeks, and then a secondary nephrectomy performed.—*Parke G. Smith,* Cincinnati.

A man, eighty years of age, with urinary incontinence for several years before and after a prostatectomy, was cured by doses of whole pituitary gland extract and mixed treatment tablets. His blood and spinal fluid Wassermann were negative.—*Paul R. Stalnaker,* Houston, Texas.

* * *

A man with paralysis agitans, eighty-six years old, and weighing eighty-seven pounds, had a thirty-six ounce prostate removed suprapubically. He had catheterized himself for twenty-five years. —*George W. Stark,* Syracuse, New York.

* * *

Because of loss of weight, vomiting, and a palpable mass in the kidney region, a diagnosis of carcinoma of the kidney was made. Urological examination was negative. Later, after a difficult defecation, a strip of gauze protruded from the rectum. This was removed, and found to be fifty-two inches long and eighteen inches wide. It had been overlooked at a gall-bladder operation six months previously. The patient recovered.—*E. O. Swartz,* Cincinnati.

* * *

A blacksmith, ninety years of age, who had learned his trade at the age of eleven, and who did not retire until he was eighty-seven, attributed much of his good health to the use of tobacco: he had chewed since he was four years of age, and had smoked continually since he was a young man. For thirty-five years, he had catheterized himself three to seven times daily—approximately sixty thousand times—until suddenly one day, a five-inch piece of catheter broke off in his bladder. His technique was also interesting: he applied lubricating jelly with his unwashed hand, and *usually* washed the catheter in soap and water after using it. He had only a mild degree of cystitis, was very active, and in excellent health.—*Howard L. Tolson,* Cumberland, Maryland.

* * *

A child, four years old, presented a glans penis which was severed from the penis except for a fine cord which contained the blood supply. An unintelligent mother explained that one year previously she had fastened a hairpin on the foreskin in an attempt to do a circumcision. The surface of the glans and penis were healed as though a clean incision had been made. The doctor stitched the glans back in place, reëstablished the urethra, and obtained good results.—*William P. Willard,* San Francisco.

* * *

A patient complained of frequent and painful urination. X-ray showed three shadows in the region of the bladder, one of which contained a pin. Cystoscopy showed but one stone, which was crushed and evacuated. A lateral cystogram located the other two shadows in the rectum. Operation revealed a fistula between the lumen of the appendix and the extraperitoneal cavity on the right side of the bladder, in which was the stone containing the pin. The other stone was in the tip of the appendix and it was formed of the same salts. This is apparently the only authentic case of a urinary calculus within the lumen of the intestinal tract.—*Burnett Wright,* Los Angeles.

523 West Sixth Street.

DISCUSSION

Robert V. Day, M.D. (1911 Wilshire Boulevard, Los Angeles).—Doctor Dakin has certainly gone to a lot of pains, and expended a great deal of energy in assembling these interesting and bizarre case reports. All are unique and instructive as well, and are attested by outstanding authorities, so there can be no doubt of their authenticity. The paper is so trite, yet complete, that there is little left for a discussant to add, except to highly commend him for his presentation.

*

Carl Rusche, M.D. (906 Taft Building, Hollywood).—One is immediately impressed with the amount of time and energy expended in accumulating such a large number of unusual case reports. I do not know of any place in the literature where such a list of unique cases can be found. I wish to compliment Doctor Dakin for his medical originality, and trust that he will continue to publish this unique accumulation of material.

May I solicit others to contribute their unusual urologic cases in order that the Doctor Dakin "column" may be perpetuated.

*

Edward W. Beach, M.D. (Medico-Dental Building, Sacramento).—Dr. Wirt Dakin deserves the plaudits of the profession for having created and developed his original idea of "Believe-It-or-Not in Urology" items, after the manner of Ripley and with the latter's full permission. This interesting feature of the urological program, which was inaugurated several years ago at the annual meeting of the American Urological Association, has now become international in scope, and its yearly advent is eagerly anticipated by many of the members.

Doctor Dakin painstakingly collects his data from near and far, and then arranges the material in such a way as to relieve the tedium contingent upon the presentation of a large number of very scientific essays in a very brief period of time, as is the custom of conventions. By reason of these "Believe-It-or-Nots in Urology" a considerable degree of warmth, sparkle, zest, mirth, intimacy, and general good feeling is imparted to an otherwise stilted, formal, and coldly scientific atmosphere. The case presentations are, likewise, both educational and instructive.

Perhaps another reason for the popularity of "Believe-It-or-Not in Urology" items is that they often treat directly of the human equation in the medical problem. Thereby they touch a responsive chord in the breast of every physician, for above all others by nature of his calling, the physician must, like Abou ben Adhem, love his fellow men. Anything, therefore, which deals with the human factors—the frailties, the oddities, the perversities, and the general incomprehensibility of human nature in its relation to actual problems encountered in the practice of medicine—finds instant appeal to the physician everywhere. After all, the physician's problems are fundamentally the same, regardless of geographic location.

Perhaps no contribution better illustrates the truth of the celebrated Hippocratic aphorism, "Life is short, and the art long; the occasion fleeting; experience fallacious, and judgment difficult." Moreover, these compilations of Doctor Dakin's but serve to illustrate the aptitude of Whetham's little poem, to which each physician with due humility must subscribe:

"But beyond the bright searchlights of science,
Out of sight of the windows of sense,
Old riddles still bid us defiance,
Old questions of Why and of Whence."

Let us hope Doctor Dakin will continue with this excellent work.

THE LURE OF MEDICAL HISTORY†

PURKINJE'S PIONEER SELF-EXPERIMENTS IN PSYCHOPHARMACOLOGY*

By P. J. Hanzlik, M.D.
San Francisco

PART II**

THUS Purkinje's unusually clear description and correct interpretation of these interesting side actions of digitalis, over a century ago, are strictly in accordance with those of the present day and will probably hold for all time. Today records of these side actions on vision in the clinical use of digitalis are a commonplace, but their relationship to the drug's actions was not suspected or recognized until 1925, when they were rediscovered and brought to the attention of the medical profession. While these side actions are important clinically as a warning of beginning toxicity from digitalis, the so-called "minor toxicity symptoms," for Purkinje they were essentially manifestations of a disturbed physiology. He proved by his experiments that digitalis did not create directly those flickerings in the eye, but rather indirectly by mediation through some other physiological function; in this case nausea and emesis. For drugs do not create new physiological functions; they only affect those existing. Thus, Purkinje was always intrigued by other means or possibilities of probing deeper into an understanding of physiological function. He was probably well aware that he was laying down at the same time a more secure foundation for pharmacology. His drug experiments were not mere by-products of physiology. This seems to be indicated in his most interesting paper entitled, "Einige Beiträge zur physiologischen Pharmacologie," published in 1829.[7] It deals with interesting effects from drug combinations, which I may discuss next.

SELF-EXPERIMENTS WITH DRUG COMBINATIONS

In his paper on physiological pharmacology, Purkinje has declared his preference for self-experiments in pharmacology. His object is to reveal all actions, especially the subjective, which cannot be tested on animals. First, he determined results with some individual drugs which entered into certain combinations.

Camphor.—After taking 6 grains (0.4 gram) of gum camphor by mouth, Purkinje experienced only an oppressive burning sensation in the stomach, but 12 grains (0.8 gram) caused him to remain in bed. About fifteen minutes after the initial gastric irritation, he felt a sensation of warmth of the entire skin, and nerve irritation was marked, especially in muscle and skin nerves, with prickling of skin. Sensitivity to external environment was decreased somewhat, with a sensation of hairiness. Respiration was unusually easy and free. His mental activity was increased considerably, so that thinking seemed to be clearer. A camphor euphoria was experienced, spiritual thoughts and consciousness being increased. The leading spiritual thought was that man in his being was a superman and his calling was the liberation of his brothers.

His whole life was laid before him without a relationship to his presence, which he believed completely overlooked. This state lasted one and one-half hours, and then was lost in ordinary thoughts and duties without the slightest feeling of anxiety. Afterward, his head was not the least affected, which, however, is the case after other kinds of euphoria or sprees. This experiment was not repeated, but he thought it would be interesting and important to know if a state of exalted feeling occurred in different individuals. Probably the exalted state would soon be lost. To him it seemed important that this experience was not unlike some forms of insanity. The action disappeared rapidly just like ether, nitrous oxid and other volatile agents. It was remarkable to him that no trace of action remained afterward. Excretion of camphor occurred in the lungs and sweat, and a trace in urine. The blood apparently took up the drug and brought it to the brain and nerves. He suggested that the external temperature may cause a significant difference in the action of camphor when the skin and pulmonary volatilization is retarded.

In a final experiment with camphor, Purkinje took at once two scruples (40 grains, or 2.6 grams) with the same subjective experiences. There was also increased muscular activity, movements being easily executed, but the muscle power was unchanged. He was unable to concentrate while writing. No religious exaltation was felt as in the first experiment. He lost consciousness of his personality, felt exhausted, and required orientation with surroundings, but all this was lost in a stream of peculiar thoughts. The sensations were like those of a drunkard who calls himself names, mutters, and has moments of normal behavior. He states that he expectorated camphor in saliva and sputum. The subjective sensations increased to the point of emesis which, however, did not materialize. An hour appeared an inordinately long time, as in a dream. A similar experience was observed by Kant in his ripe old age, when an hour's walk seemed to be a long journey.

Opium Nostras.—Purkinje tested this opium because it was reported to be one-fifth as strong as the oriental variety. In a small quantity it acted to prevent the stupor of wine. He suggested that perhaps this action explained its effectiveness in delirium tremens.

Belladonna.—Half an hour after Purkinje took twenty drops of an extract of belladonna on sugar, there was dryness of the nose and mouth. There was a feeling of anxiety in the precordial region and sometimes the pulse was full. Contractions were felt in the urinary passages, and urine was scanty. Beef soup tasted sour, and afterward there

† A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* Sigma Xi address, University of Nebraska, Lincoln, Nebraska, February 16, 1938.

From the Department of Pharmacology, Stanford University School of Medicine, San Francisco.

** Part I of this paper was printed in California and Western Medicine, July, 1938, on page 52.

was a peculiar taste of senega. This was not due to the food eaten, because other dietary articles gave the same sensations. Dry bread tasted peculiar when chewed. These peculiar oral sensations were due to absence of saliva and mucus, their presence contributing normal sensations. All actions of belladonna were due to the decreased secretions.

A hypochondriac individual, whom Purkinje knew for some time, experienced the same sensations as did Purkinje after the belladonna. So he tried treatment of this state with homeopathic doses of belladonna and thought he observed a beneficial action in a way which, however, could have an explanation in the variability of the disease.

Stramonium.—This drug gave similar effects to those of belladonna, with this difference, that an alcoholic extract of the seeds caused depression, that is, a narcotic action. This he had never observed with belladonna, but both drugs caused dilatation of the pupils. Today stramonium is used in excitatory states, like Parkinsonian disease and the like.

Turpentine, With and Without Alcohol.—First, Purkinje took one dram (60 minims, or 4 cubic centimeters) of turpentine on sugar every morning with unpleasant sensations in the alimentary tract, but he could sleep off the effects with one hour's sleep daily. He slept better both day and night, there being quieter and calmer sleep after turpentine. He thought it might be used as a hypnotic in certain cases.

He felt an unusual experience when he took a glass of wine with the turpentine, which was not felt after wine alone. An unusual euphoria occurred, due not to a specific action, *i. e.*, previous depression of the central nervous system by the turpentine, and the action lasted several days. With pure turpentine a dizziness occurred, but not after taking a mixture of alcohol and ten drops of turpentine. He thought this mixture might be suited to some individuals under treatment (alcoholic intoxication?).

Narcotic Action of Oil of Nutmeg.—Purkinje's results with turpentine suggested trials with this volatile oil. One morning he ate a nutmeg with sugar, which was not unpleasant; yet he felt a weariness and a sense of depression which lasted a whole day, though not disturbing mentally. But he noticed, after taking a small glass of table wine, that the nutmeg affected him very much.

One afternoon, after dinner, Purkinje ate three nutmegs. The action came on rapidly. There was marked sleepiness with pleasant dreams, which were disturbed occasionally by some restlessness. Finally, he laid down on a sofa to sleep. He states: "At half-past six (in October), when it was almost dark, I woke up in order to go to the Royal Theater in Brüder Street (Berlin) where I lived. The distance was long, but this time I thought it had *no end*. My movements appeared entirely adequate, but were lost momentarily in dream pictures, from which I had to extricate myself with considerable force in order to keep on walking. My feet did their duty, and, since I had to stick to a straight road, there was no danger of going astray. I went forward in this dream, for, if I attempted to orient myself, I could not even recognize the cross streets. Time seemed long. I got to the opposite side of the place where I was going. During this time dreams and physical activity battled one another. The return journey was good, and I slept well that night and next day." *But the wine acted on him more powerfully than usual for several days.*

In his next experiment, Purkinje rubbed up two drams (120 grains, or 8 grams) of nutmegs with pure brandy and drank the extract; the action was different. Instead of a quiet narcosis, there was muscular restlessness and dizziness. This was due to an internal action of the nutmeg in this combined form. This oil, turpentine, and all volatile oils act on the cerebrum and cerebellum. Combined with alcohol they affect the motor functions more, so that the actions of aqueous and alcoholic mixtures should be different. Pharmacodynamically, the action is less chemical than on the organism, *where an agent increases the disposition to the action of another drug.* He regretted that he could not investigate the effects of coffee or tea on different drugs, because his scientific interests became diverted. But Purkinje had no doubt that observations in this field would throw light on many problems. Equally important was a cautious attitude which he expressed. He said that the few experiments he could make should be repeated on a large number of individuals so as to give a correct general result; this, in order to establish subjective results as soundly as the objective, and not leave them merely empirical.

As regards Purkinje's self-experiments with nutmeg, essentially the same symptoms in the early stages of nutmeg poisoning were described seventy-eight years later by the late Professor Cushny,[8] who was apparently unaware of Purkinje's description. Two years after Cushny's report, Dale,[9] who reviewed reports of clinical actions and poisoning from oil of nutmeg, and undertook experiments with the oil on cats without success, also did not refer to Purkinje's self-experiments. In his Alpha Omega Alpha Lecture on Leeuwenhoek in 1933, before the California-Stanford chapters, Professor A. W. Meyer, professor of anatomy at Stanford, discussed certain pharmacological experiments with nutmeg on mites by this microscopist; he also referred to them in a recent article.[14] Mites were exposed to pieces of nutmeg in a glass tube; these would approach the nutmeg and then rebound as they came closer. If they remained very close, they died (narcosis and paralysis?). This was about 1676, so that Leeuwenhoek preceded by something like 153 years Purkinje's self-experiments with nutmeg.

COMMENT

To return to Purkinje's results with drug combinations, he seems to have been the first one to recognize that drugs can affect each other's actions. In other words, Purkinje discovered the allergic state. More than that, he demonstrated it on himself. He actually showed a sensitization on himself to two drugs as the result of taking another drug. That is, an habitual glass of wine (weak

alcoholic beverage), without action itself, increased his reactions to turpentine and to nutmeg. This can be regarded as a case of potentiation of action on drugs by another drug. Besides making a clear demonstration of allergy, Purkinje also suggested the correct explanation of the phenomenon. He concluded that these drugs did not react with each other directly, and thus did not alter their actions in a chemical sense, but that the changes were produced by some effects on physiological functions. What apparently puzzled him was that a drug whose action was no longer expressed could still influence the actions of other drugs so markedly. However, this puzzle is still unsolved today. Nevertheless, it must be granted that Purkinje demonstrated long ago that conditions influence the actions of drugs, something now universally recognized, but he is never credited with this discovery.

EXPERIMENTS ON CILIA

Before closing, I cannot forego the mention of Purkinje's original pharmacological experiments on cilia in 1835.[10] These were done with his favorite pupil, Valentin. In this work there are presented a table and discussion of results with fifty-five chemical agents and drugs which acted on ciliary motion. Among other phenomena, Purkinje and Valentin recognized that organic acids (acetic and others) affected cilia more quickly and readily than inorganic acids (HCl and others). Eighty years later Olmsted and MacArthur[11] described exactly the same differences; in fact, used the same acids on frog cilia without apparently being aware of Purkinje's and Valentin's experiments. The only difference was in the method of expressing the strength of the acids, *i. e.,* use of p_H by Olmsted and MacArthur. Purkinje made this clever deduction: Since hydrocyanic acid and strychnin do not poison cilia, these structures do not belong to the central nervous system. Another deduction in a similar vein, but having nothing to do with cilia, was as follows: Frogs killed with narcotics are not entirely dead, since the muscles and nerves of their bodies respond to direct stimuli. This was really clever for those exclusively anatomical days. As a result, Purkinje was called a "physiological anatomist."

IN CONCLUSION

It can be said of Purkinje what has been said before by others—the genius of the great master, Purkinje, has remained undeservedly obscure. And what do you suppose this self-effacing supermaster of physiology is reported to have said on New Year's Day, 1869, the year of his death (age, eighty-two years)?

"I have indeed discovered various things, but, as for immortality of my name, this should not be taken literally. A hundred years hence perhaps only a few will know who Purkinje was. But that makes no difference. For indeed we do not know who discovered the plow, and yet it serves all humanity. The cause remains the same, but not the name—and that is the important thing" (Hykes[12]).

CLINICAL NOTES AND CASE REPORTS

PSEUDO-PROPTOSIS FROM SUBCONJUNCTIVAL TUMORS

By Howard E. Clark, M.D.
Monterey

MUCH has been written about false exophthalmos due to orbital tumors and its diagnostic complications. Here is a case of subconjunctival lipomas with a desiccating keratitis.

REPORT OF CASE

Mr. Ira B., colored, age fifty-one, was referred to the Monterey County Hospital on November 1, 1937, with a diagnosis of bilateral tumors of the lachrymal glands. He complained of failing vision in the right eye, with excessive weeping of several weeks' duration. The patient stated that the eyes had always been prominent, but that the swellings on the upper and outer portions of the eyeballs had been noticeable since 1918.

There had been no symptoms referable to the eyes until the present complaint. No severe illnesses or childhood diseases were remembered. Vision had always been good and the eyes had never been examined. Venereal infection was denied.

Examination:

Vision: Right, 20/65. Jaeger iii at 15 inches. Left, 20/20. Jaeger ii at 15 inches.

There was a marked proptosis in both eyes, slightly more on the right. The lids were very loosely applied to the globes. Lachrymal glands were easily seen projecting slightly below the orbital rim. Both eyes showed a yellow-

Fig. 1.—Subconjunctival tumor in right and left eyes.

ish subconjunctival mass about the size and shape of a forefinger tip extending downward and medially, from the lower margin of the lachrymal glands to a point one and one-half centimeters from the limbus. The upper and outer margins were not visible, apparently extending back into the orbit. The right cornea was roughened and stained slightly with fluorescin. The fields were normal. The fundi were fairly well seen and were normal.

The Hertl exophthalmometer showed: R. 22, L. 20.

Blood and urine negative.

Basal metabolism: Plus 23.

Pulse: 70, regular. B. P. 124/72.

Course.—November 23, 1937: The right tumor mass was dissected out without difficulty. The mass was a comparatively nonvascular, yellowish tumor, one and one-half centimeters wide and two centimeters long. It extended a narrow pedicle into the orbit. Biopsy showed fatty tissue only.

December 4, 1937: The left was operated upon with similar findings.

December 14, 1937: Both conjunctival wounds were well healed. The weeping had stopped and the patient was comfortable. The corneae were clear, showing no staining reaction with fluorescin.

February 3, 1938: Vision—Right, 20/30; left, 20/20. Distance vision not improved with correction.

With the exophthalmometer the right eye showed 22 mm., the left 20. The patient was delighted with the improvement in his appearance.

HYPEREMESIS GRAVIDARUM: NOTES ON TREATMENT

By William Buster McGee, M.D.
San Diego

THE treatment of vomiting of pregnancy has changed very little in the past few years, in spite of the fact that there have been many advances in our knowledge of the vitamin and hormone deficiencies. Probably vitamins B1 and G are involved more than any of the others. As a whole, the use of female sex hormones has been very disappointing, with the possible psychic effect of hypodermic injections.

We have divided hyperemesis gravidarum into four clinical groups and, depending on the severity of the case, we decide which form of treatment is to be used. No routine procedure can be successful, as each is an individual problem. The serious cases are started, for about two days, on the severe regimen, intravenous and subcutaneous fluids, with nasal tube feedings, on the third and fourth days, then fifth and sixth days on the vomiting diet, and on the seventh and eighth days a dry diet. The patient may be started on any of the four diets; and, depending on her reaction to the therapy, it may be worked either forward or backward.

I. MILD TYPE

Carbohydrate, 400; protein, 50; fat, 25.

Omit liquids one hour before and one hour after meals.

Six a. m. and midnight feedings.

Dry toast or crackers before rising.

Sweetened fruit juices between meals.

Ferrous sulphate, grains five, after meals, if anemic.

Phenobarbital, grains three-fourths, morning and evening.

II. MODERATE TYPE

Carbohydrate, 400; protein, 50; fat, 0.

Dilute HCl, fifteen drops, before meals, if gastric analysis shows low reading.

If pulse is over 90, Lugol's solution, five drops after meals.

Phenobarbital, grains three-fourths, given with liquids, three times a day.

Substitute dicalcium phosphate and A B D capsules for milk.

No coitus allowed.

Daily enema, if necessary, for constipation.

Diet for Moderate Type

1. Take solid food at 8 a. m., 12 noon, 4 p. m., and 8 p. m.
2. Take liquids at 10 a. m., 2 p. m., 6 p. m., and 10 p. m.
3. Take any medication with liquids.
4. No fat or greasy foods.
5. Solid foods:

(*a*) Stewed fruits, with plenty of sugar.

(*b*) Cooked or dry cereal, with plenty of sugar.

(*c*) Toast, crackers, corn bread, Graham muffins, whole-wheat bread, with preserves, honey, jelly, molasses.

(*d*) Lean meats, crisp bacon or ham, cheese, hard-boiled eggs; sandwich with toasted bread (no butter or mayonnaise).

(*e*) Baked, mashed or boiled potatoes, baked sweet potatoes, macaroni, spaghetti (plain), rice.

(*f*) Fresh, raw vegetables, such as lettuce, tomatoes, celery, and radishes.

(*g*) Raw fruits, such as bananas, oranges, apples, lemons, and grapefruit.

(*h*) Cooked vegetables, spinach, asparagus, peas, white onions, cauliflower, carrots, beets, corn, and beans.

(*i*) Gelatin, jello, custard, prunes, tapioca, ice cream, and fruit ices.

6. Liquids: Fruit juices (orange, lemon, pineapple, grapefruit), coco-cola, skim milk, tea, ginger ale, and water.

III. MODERATELY SEVERE TYPE

Hospitalize.

Physical and pelvic examination.

Blood count and urine examination (acetone and diacetic acid).

Darkened room and no visitors (including husband).

Absolute bed rest.

Daily enema.

Temperature, pulse, respiration, every four hours.

Measure intake and output.

Insert Levine nasal tube into the duodenum at 7 a. m., which may be removed at 10 p. m.

Make up a formula as follows:

Tube-Feeding Formula

Milk	800 cc.
Lactose	200 gm.
Eggs	4
Peptone	24 gm.
Salt	5 gm.
Cevitamic acid	50 mgm.
Cod-liver oil concentrate	20 drops
Vitamin B1 crystals	2 mgm.

One hour after the tube has been inserted start formula as a slow continuous drip. If vomiting occurs, reinsert tube and wait one hour, with the patient on right side before starting drip. Give phenobarbital, dilute HCl, or Lugol's solution, if indicated, through the tube. Maintain the fluid intake up to 3,500 cubic centimeters per day by hypodermoclysis of normal saline or Ringer's solution; or, if acetone and diacetic acid in the urine, 20 per cent glucose by intravenous drip. The glucose may be covered with insulin.

IV. SEVERE TYPE

Nothing by mouth, except small amount of cracked ice. Bed rest; temperature, pulse, respiration, every four hours. Measure intake and output. Transfusion, if hemoglobin is 70 per cent or less, sodium phenobarbital, grains four, hypodermic, then two grains every six hours until drowsy; then every eight hours for two days. Sodium bromid crystals, 75 grains in 100 cubic centimeters of starch water, as a retention enema, the first night. Give 1,000 cubic centimeters 20 per cent glucose infusion twice daily, over a period of ninety minutes. Get CO_2, urea and NaCl blood chemistry at the time of the infusion each morning; 1,000 cubic centimeters of normal saline by hypodermoclysis twice daily, alternating between subpectorally and in the thighs, always several hours, after the glucose. (Use procain wheal.) Hartman's solution may be added if acidosis or alkalosis is present. Daily urine examination for acetone and diacetic acid. Eye-grounds examination. If no improvement, interruption of the pregnancy should be considered.

SULFANILAMID: A SPECIFIC FOR THE FRIEDLANDER BACILLUS

By Philip King Brown, M.D.
San Francisco

ONE case can rarely be considered the ground for drawing so definite a conclusion as the title indicates, but the history of the case makes it remarkable.

REPORT OF CASE

Miss B. K. had her tonsils removed in February, 1917, following which she developed a condition in the right lung which proved later to be an abscess. The abscess was in about the middle of the right lung field toward the back, and was considered to be in the upper part of the right lower lobe. Pleurisy developed under the right shoulder blade. Partly to relieve that pain, and because the abscess did not drain well, the use of a small pneumothorax was attempted successfully, and it was found promptly that the abscess both discharged better and there was no tendency to spread. A moderate pneumothorax was kept up until all discharge ceased, and the lung field seemed to be definitely clearing. The nature of the infecting organism was not determined.

Following the expansion of the lung there developed a slight cough and expectoration, and a lipiodol injection showed that there was a definite dilatation of the large bronchus extending from the middle of the hilus, definitely toward the back in the vicinity of the shoulder blade. The use of the lipiodol relieved the green expectoration for a considerable period of time, although it did not disappear entirely. A fresh cold would increase the amount from one to two drams a day to several ounces. On numerous occasions this was cultured, and a pure growth of Friedlander bacillus was found. In the seventeen years which followed the abscess there continued constantly to be a small amount of expectoration when the patient was quite well, which was increased decidedly following every cold, and was not relieved until lipiodol was put into the dilated bronchus. There continued to be a slight increase in the pain under the lower end of the right shoulder blade.

The patient all these years worked as a private secretary, but was constantly annoyed by the sweetish-green expectoration which showed so ready a tendency to increase with every slight cold.

In the summer of 1937, after a severe cold, she was instructed to spend two weeks at an elevation of 2,500 feet in a hot, dry locality, doing all she could with postural drainage and iodid of potash. At the end of a week no material benefit having resulted in the way of lessening the amount of expectoration, which was between two and three ounces a day, she was instructed to take sulfanilamid in the following doses: 30 grains the first day, 45 the second, and 60 the third, dropping back to 45 grains, and 30 on the fifth day. At the end of the third day there was absolutely no expectoration, and the pain in her back disappeared. She kept in touch with me, although several hundred miles away, and was instructed to continue taking small doses for a while longer.

Six months have gone by and there has been no evidence whatever of any return of the expectoration. She has had several slight colds, but has promptly taken small doses of sulfanilamid, and none of them have resulted in the productive cough.

COMMENT

The case is reported because the cultures were made by Dr. A. M. Moody, pathologist of the Saint Francis Hospital, during all this period. The result was so absolutely clean-cut that it seems to the writer worth putting on record.

We have since tried the drug once on an arrested case of tuberculosis, with a left upper thoracoplasty which had not completely stopped the productive cough. Friedlander organisms predominated in the sputum and no tubercle bacilli have been found for years. A cautious trial of sulfanilamid was made after a fresh cold which increased the amount of sputum, and again a remarkable drop in the amount resulted at once. As the tendency to the production of fibrosis is one of the characteristics of this organism, the problem presented itself as to whether the removal of one or two more ribs was a safer treatment than continuing the use of this drug. The patient in the meantime was not pressed for any decision in the matter. The newspaper publicity about sulfanilamid disturbed him, and he had no great desire to undergo further surgery.

NECROPSIES IN HOSPITALS IN SAN FRANCISCO*

By J. C. Geiger, M.D.
AND
Jesse L. Carr, M.D.
San Francisco

IT has been the custom for some years in certain of the large cities of the United States to survey and report the necropsies performed, together with the numbers credited to each hospital in that locality, and the percentage of permissions obtained. In order to make this information available for use in San Francisco, an effort was made at the beginning of 1937 to collect the necessary statistics with which to formulate a table presenting salient facts relating to necropsies.

* From the Department of Public Health, City and County of San Francisco.

Eighteen of the forty-five hospitals listed in the San Francisco area responded to the questionnaire, supplying information in detail for 1936, and partial information for the previous years. From the data received, the percentage of permission obtained for necropsies is shown in Table 1, together with a more detailed analysis of the data furnished for the year 1936. In that year the capacity of the reporting hospitals was 4,344 beds, and 82,758 patients were treated, and 3,989 deaths occurred. Total necropsies performed, by consent, in these hospitals were 1,331, and the number of cases referred to the coroner's office from these hospitals was 482. Of the cases referred to the coroner, the hospitals have record of forty necropsies performed at the coroner's office. The percentage of permissions obtained for the San Francisco area was 33.3 per cent in 1936, and the average in the past ten years for each of the hospitals furnishing complete data is listed in Table 2.

In computing the percentage of permission obtained for necropsies, the figure taken for the number of deaths is the actual number recorded (not including stillbirths). In one hospital no record of necropsies has been kept. Another hospital reported no facilities for performing necropsies. Two other hospitals reported insufficient data from which to evolve statistical information, and in another no necropsies were performed on consent, presumably because of racial objections. Ten hospitals reported that the pathologist spends full time (six to eight hours per day) in the pathological laboratory within the hospital. Three others reported that the pathologist spends part time (four hours or more per day) in the laboratory, while five others have no pathologist. In all of the

Franklin	4.7	(8 years)

hospitals, either the pathologist or an assistant under his supervision makes each necropsy, except in rare instances, in which they are performed by certain members of the house staff. All hospitals in San Francisco, with either full or part-time pathologists, have kept permanent records which are available for inspection of gross and microscopic findings in each case. Likewise, the following hospitals report the holding of weekly pathological conferences: University of California, Stanford, San Francisco, French, and Mount Zion. In addition, the St. Francis Hospital reports conferences every two weeks; and the Garden Nursing Home, St. Joseph's, St. Luke's, St. Mary's, Children's, Chinese, Franklin, and the Southern Pacific Hospital report one conference each month.

It will be noted in Table 1 that there has been a gradually ascending necropsy percentage in San Francisco during the past nine years; and, while not shown statistically, the interest in clinico-pathological conferences and in pathological teaching has kept abreast of this statistical level.

At present a system of tabulation is instituted in the San Francisco Department of Public Health whereby such figures are available at all times.

Department of Public Health,

TYPHOID SEPTICEMIA TREATED WITH SULFANILAMID

By W. E. DIEFENBACH, M.D.
AND
ANTON S. YUSKIS, M.D.
La Jolla

BUTTE and his coworkers[1] have found that the survival period of mice infected with many lethal doses of Bacillus typhosus was lengthened or they were entirely protected by the administration of sulfanilamid. It is, consequently, of interest to record the effect of this therapeutic agent upon a septicemia in man due to Bacillus typhosus.

REPORT OF CASE

History.—A. L., a white man, age twenty-one, was admitted to the hospital on January 2, 1938, complaining of chills, fever, loss of appetite, lassitude, and a mild headache. He had enjoyed excellent health until November, 1937, when he had an attack of appendicitis while in Colorado. An acute respiratory infection postponed operative intervention at that time, but an appendectomy was finally done and a stormy time followed a perforated appendix. He gradually improved, gained in weight and strength, and came to California. His convalescence was satisfactory until January 1, when he felt tired and below par.

[1] Butte, G. A. H., Parish, H. J., McLeod, M., and Stephenson, D.: Chemotherapy (Sulfanilamid) in Mice, Lancet, 1:681-684 (March), 1937.

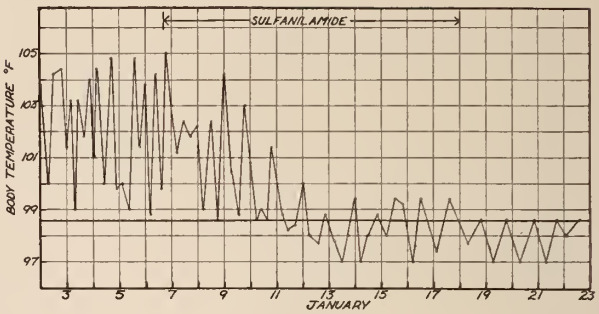

Chart 1

Examination.—The patient was well developed, fairly well nourished, pale, mentally clear, and alert. The skin was clear, no rose spots and no embolic or hemorrhagic manifestations. There was no unusual adenopathy. The temperature was 104.6 degrees; pulse 100; blood pressure, systolic 104 and diastolic 60. There were no abnormal findings in the head, neck, thorax or extremities. There was a recent scar in the right lower quadrant of the abdomen. There was no muscle spasm or no abnormal masses felt. Neither the liver edge nor spleen could be definitely palpated. There was no tenderness in either costovertebral angle. The first blood count (January 3) showed: hemoglobin, 75 per cent; red blood cells, 3,700,000; white blood cells, 6,550 with 67 per cent polymorphonuclears, 30 per cent lymphocytes, and 2 per cent monocytes. The urine showed only a faint trace of acetone. Specimens of blood were taken on January 4 for cultures.

Course.—The patient continued to have severe chills—three to four in twenty-four hours—and fever ranging from 97.8 to 105 degrees Fahrenheit for the next three days. His condition gradually became worse. On January 6 the broth culture and one poured plate gave a motile Gram-negative bacillus. Growths on Endo and Russell double sugar media were typical of Bacillus typhosus, and eliminated Bacillus coli, and Paratyphoid bacilli motility eliminated the dysentery group. Agglutination test—Antityphoid serum agglutinates, 1:2560. On January 7 we started to give him ten grains of sulfanilamid every four hours. On January 8 the temperature varied from 101.2 to 102.4 degrees Fahrenheit, without any chills. Because of a marked nausea present the next day, the dosage of sulfanilamid was cut down to one-half or five grains every four hours. That same evening he had a severe chill and the temperature rose from 98.6 to 104.2 degrees Fahrenheit. So the next morning, January 10, he was placed again on ten grains every four hours. The patient began to show a marked improvement, as his temperature dropped and the chills did not recur. At the end of a week's treatment the temperature was almost normal, rising to 98.8 degrees Fahrenheit. During the second week of treatment the patient had an afternoon temperature of only 99.4 degrees Fahrenheit, and showed a marked improvement in his general condition. The sulfanilamid was stopped on January 18. After this his temperature ranged from normal to subnormal. On January 28 the patient was dismissed with a normal temperature.

Examination of the stools and urine failed to reveal the Bacillus typhosus. Likewise, the Widal test was negative. Daily blood and urine examinations were made during the course of treatment. Roentgen examinations of the chest and abdomen were negative.

COMMENT

It was our impression that there were two possible explanations for this illness. First, that this may represent a very questionable atypical typhoid fever. Secondly, and more probable, was that the organism was present in the intestinal tract at the time of the peritonitis, and localized to form an abscess possibly in one or more retroperitoneal lymph nodes with a gradual softening and systemic invasion. There was no evidence pointing to liver abscess, subdiaphragmatic abscess, perirenal abscess, pararectal abscess, nor pyelitis.

CONCLUSIONS

Our brief experience with the use of sulfanilamid in the treatment of a typhoid septicemia leads us to believe that this drug may prove to be of value in the treatment of typhoid fever. The prompt response to treatment, the smooth clinical course, the absence of complications, and that the infection did not progress, together with a reduction in hospital expenses that is usually necessary in the treatment of this infection, have impressed us considerably.

7819 Girard Avenue.

HEMATOCOLPOS DUE TO IMPERFORATE HYMEN

By E. M. Bingham, M.D.
AND
W. J. Blevins, Jr., M.D.
Woodland

THE occurrence of hematocolpos and hematocolpometra seems sufficiently rare to justify a case report. Review of the literature shows that most of the individual cases have been reported from European countries. A complete summary of this condition was presented by Calvin and Nichamin[1] in 1936. They analyzed twenty-six cases reported in the literature, and fourteen cases available from hospital records. It is of interest to note in these cases that 62 per cent were less than fifteen years of age; that the complaint in 58 per cent was urinary disturbance, frequently retention; in 38 per cent, abdominal tumor. The case to be reported here was brought to light by a complaint of amenorrhea.

REPORT OF CASE

L. L., female, age fifteen, a senior in high school, was referred for examination at school by the instructor in physical education, on September 21, 1937. In addition to the complaint of amenorrhea, she stated that in December, 1936, she noticed a small mass in the lower abdomen. This had increased somewhat in size, and was associated with right lower quadrant pain which she and her mother had attributed to her appendix. For the past few weeks there had been anorexia, nausea, and occasional vomiting. Her mother had been concerned about the failure of menstruation to appear, and had been giving her a well-known proprietary compound. The history did not suggest periodic menstrual symptoms. There was no urinary disturbance nor discomfort while sitting, as described in some reports.

Examination showed an undernourished white girl of normal development, but apparently not well. No pathology was found except in the abdomen. The breasts were well developed and pubic hair was normal. In the lower midabdomen a visible and palpable tumor was present. This was the size of a four or five months' pregnancy—firm, movable, and not tender. It seemed to be more firm than a pregnant uterus, and no fetal heart tones were heard. The patient was unable to state just when her breasts developed, but her mother recalled consulting a physician five or six years before because one breast was developing more rapidly than the other. She was sent to the Yolo County Hospital for pelvic examination and treatment with a tentative diagnosis of hematocolpos.

Pelvic examination on September 24 revealed a bulging, intact hymen, best described as similar to a small apricot in appearance. This was injected with novocain and a small longitudinal incision made. Dark blood and ropey mucus escaped, estimated as over 1500 cubic centimeters in amount. The tumor receded, and the following day the patient was discharged. Two days later all flow had stopped and she was permitted to get up. On the evening of September 29 she suddenly started flowing. When seen an hour later, all flow had stopped and apparently only old blood had been discharged. This may have been trapped in the uterus or vagina. She entered the hospital again on October 4, at which time some old blood was found retained in the vagina and the hymen would not admit the tip of a finger. Under gas anesthesia the incision in the hymen was enlarged in a radial manner. On two subsequent occasions she returned for dilatation, at which times the introitus would admit two fingers. She had refused further treatment, and when last examined the introitus would admit only one finger.

The first menstruation occurred on November 5, with normal flow, lasting for six days. Three subsequent periods have been of average flow, interval thirty-three to thirty-four days, lasting five to six days. The first day of each period has been accompanied by backache and rather marked nervous symptoms, which were not present before surgery. General health and color have definitely improved.

This case may serve to emphasize the importance of medical investigation of instances of delayed menstruation. It illustrates, also, the need of wide incision of the hymen if recurrence or stenosis is to be avoided.

SARCOPHAGID MYIASIS

By F. F. Gundrum, M.D.
AND
H. H. Keifer, B.S.
Sacramento

THE big, gray flesh-flies, Sarcophaga, are common in California. Infestation with their larvae has not been reported from this district; hence, the following case may be of interest.

REPORT OF CASE

Mrs. H. P., white, thirty-two, married, came to the office on October 5, 1936. She had been "feeling miserable all summer, with aches and pains all over." She did not take any treatment. About September 1 she had a tender and painful swelling in the right lower abdomen; this moved to the right groin, then under the thigh, and finally to the left hip, where the "bump opened one night while she was in bed and a worm came out."

Upon examination there was seen to be a clean-cut oval hole, 3 by 2 millimeters in size, on the posterior surface of the left thigh at the junction of the upper and middle thirds; no induration or redness. The offending "worm" was a larva about 20 millimeters long and 6 millimeters in diameter, with a sharpish point at one end and rather abruptly squarish at the other.

This larva was poured down the sewer (much to our distress) by a laboratory "Diener"; however, about six weeks later our patient mailed us a smaller, less well-developed specimen, which had come out of the left leg by its cutting a small, oval hole through the skin. Exit of the worm promptly relieved the swelling and soreness previously distressing.

COMMENT

The maggot, which is nearly half an inch long and rather badly distorted, has been very kindly determined for us by Dr. M. A. Stewart of the University of California as, apparently, Sarcophaga sp. It is a Muscoid type, lacking the characteristic spines of the Œstrids and, therefore, not referable to the botfly group. Muscoid larvae of the Sarcophagid group have rather characteristic caudal structures, which are not apparent in this larva, due mainly to the distortion. The rear spiracles are very small, suggesting that the larva is quite immature. We can, therefore, conclude that the species involved is an unusually large fly. (Wohlfahrtia vigil, a Sarcophagid which has been taken

from beneath human skin in the maggot stage, has a larva known to attain a length of slightly over half an inch.)

The Sarcophagids rarely cause human myiasis. There are two or three cases on record in the United States, covering a period of some years (one very recent), in which Sarcophagid larvae were removed from under the skin of infants. The "Review of Applied Entomology" lists a few human records for the past ten years, but these are nearly all Oriental, and are primarily of Sarcophagid larvae in the alimentary canal. Calliphorid larvae (similar flies) also cause human subcutaneous myiasis.

In larval food habit, the Sarcophagids are almost invariably connected with other animals. Some breed in excrement. Many feed on carrion and dead animals. Some are important insect parasites and some are parasites of warm-blooded animals. Insects of this type are continually annoying to the human animal, in one way or another; and the occurrence here recorded, while unusual, is entirely in line with the possibilities.

POLYCYTHEMIA VERA OF THE GEISBÖCK TYPE

By LAMBERT B. COBLENTZ, M.D.
AND
FERRALL H. MOORE, M.D.
San Francisco

BECAUSE of the relative rarity of polycythemia vera, and of certain interesting features, the following case is reported as one conforming to the so-called Geisböck syndrome of true polycythemia, hypertension, and absence of splenomegaly.

REPORT OF CASE

The patient, a woman aged fifty-seven, was first seen on March 10, complaining of recurring vertigo, tinnitus, faintness, and visual blurring during the previous week. During this time she had had a hematemesis of an estimated cupful of blood on one occasion. The family history was not significant. The patient had suffered from migraine until the menopause, at age forty-eight. She had had seven pregnancies, unassociated with any toxemia so far as known, all delivering normally at term. There was no history suggestive of a previous glomerulonephritis. Hypertension had been discovered four years ago on routine examination, and the patient had been under the care of her local physician since. Nocturia, two or three times per night, had been present for three years. During the past year the patient, who had been obese, had reduced some forty pounds by diet. General and systemic histories were otherwise negative.

Physical examination revealed a slightly obese woman of stated age, with grey hair and ruddy complexion. The lips were cyanotic and the mucous membranes deeply reddened. Complete dentures were present. The tonsils were small, with chronic infection. The pupils were equal and regular, reacting normally to light and accommodation. Fundus examination revealed considerable narrowing and nicking of the retinal arterioles, with arteriovenous compression; the retinal veins were remarkably distended. A few scattered small hemorrhages were noted, as well as some cotton-wool patches and small areas of hard macular exudate. The discs were normal. The thyroid was not enlarged, and no adenopathy was noted. The lungs were negative, no emphysema being found. The heart was enlarged to the left, all tones were loud, and the aortic second was accentuated. Radial thickening, graded 2, was present; the blood pressure was 220 systolic, and 120 diastolic. Neither liver nor spleen were palpably enlarged at any time. Diastasis recti was present. The uterus and adnexa were small and atrophic, and moderate cystocele was found. There was no peripheral edema, and all peripheral arterial pulsations were normal. Neurological examination was negative. The provisional diagnosis made was that of Essential Hypertension Group 3 (Keith-Wagener): general and cerebral arteriosclerosis; cardiac hypertrophy; and possible polycythemia vera.

Laboratory findings were as follows: red blood cells, 8,560,000, hemoglobin, 145 per cent (Sahli); white blood cells, 14,500, with 79 per cent neutrophils, 1 per cent eosinophils, 2 per cent basophils, 15 per cent lymphocytes, and 3 per cent monocytes. No myeloid immaturity was found. The platelets on the stained smear were markedly increased both in number and size. The packed volume of red cells by hematocrit determination was 61 per cent. The blood volume (Rowntree-Geraghty) was 240 cubic centimeters per kilogram. The blood Wassermann was negative. Urinalysis revealed a specific gravity of 1.017, a trace of albumen, and a moderate number of hyaline casts. Glycosuria was not present. The blood sugar was 139 milligrams, and the NPN 71 milligrams per cent. Urinary concentration tests showed a maximum specific gravity of 1.016.

Course.—After twenty-four hours of bed rest and sedation, the blood pressure had come to a level of 180 systolic and 100 diastolic, but marked vertigo and tinnitus persisted. A venesection of 500 cubic centimeters was done. On the same day the patient had a hematemesis estimated at 500 cubic centimeters. Vertigo still being marked, and the pressure level remaining the same, another venesection, of 750 cubic centimeters, was done on the third day. Following this, the red blood cells were found to be 6,500,000, hemoglobin 118 per cent (Sahli), and hematocrit percentage 47. Several days later, on being allowed to sit up in her chair, the patient complained of dull substernal pain, radiating down the ulnar side of the right arm. Examination of the heart was negative, and an electrocardiogram showed only left axis deviation, slight elevation of the S-T segments in the first and third leads, and a diphasic T3. In the following days there was no further pain, no fever, and no audible friction rub. On the ninth day the NPN was 41 milligram per cent, and the patient felt much improved, being up and about the hospital with no further substernal pain save on one brief occasion. Due to the high incidence of vascular thromboses in these cases we endeavored to keep the patient ambulant so long as we deemed it consistent with her cardiac reserve. At the end of three weeks the pressure level had fallen to 130–150 systolic and 80–94 diastolic and vertigo did not recur. Fundus examination showed no change, save for diminution in size of the previously engorged retinal veins. The patient was dismissed from hospital on a regimen of rest, moderate, protein-low salt diet, and sedative medication. Because of the evidence earlier noted of impairment of renal function, it was deemed unwise to attempt control of the polycythemia by phenylhydrazine, which is somewhat slowly eliminated, or by irradiation, in the presence of only slight leucocytosis without myeloid immaturity. Accordingly, it was decided to control the red cell count by periodic venesections, and the patient was instructed to report to the office in two weeks for hematocrit determination, as well as for a gastrointestinal series to rule out any malignant cause for the hematemeses previously cited. At this time the packed red cell volume was 51 per cent and the blood pressure was 190 systolic and 110 diastolic; substernal pain on exertion had been present for several days. The venesection was deferred until later in the week, but the following morning one of us was called to see the patient at her home, and found her in shock, presenting the classical picture of sudden severe coronary occlusion. Death occurred several hours later. Permission for autopsy was not obtained.

COMMENT

A case of polycythemia vera is presented, without splenomegaly, and associated with severe hypertension and renal insufficiency; the immediate response of all three conditions was favorable following venesections. Death occurred suddenly, some weeks later, from acute coronary occlusion.

384 Post Street.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

HEMORRHAGE FROM THE UTERUS

I. ETIOLOGY

H. N. Shaw, M.D. (901 Pacific Mutual Building, Los Angeles).—At the risk of seeming elementary, I wish to define clearly the terms "menorrhagia" and "metrorrhagia." In the former, excessive menstruation, the flow may be greater than normal in amount, may be prolonged, or may occur at too frequent intervals, but there is no bleeding between the periods. By metrorrhagia we mean uterine bleeding that occurs independently of menstruation.

We shall consider three age periods in this discussion.

1. Childhood to puberty (1 to 14).
2. Child-bearing period (14 to 45).
3. Postmenopausal (45—).

I. INFANCY AND CHILDHOOD:

The commonest causes of bleeding in this period are endocrine disturbances. For example, withdrawal of maternal estrin at birth, ovarian (granulosa cell) or pituitary tumors. Rarely, malignancies of the uterus may be the cause. Systemic diseases, chlorosis, and the various blood dyscrasias are often factors.

II. CHILD-BEARING PERIOD:

The important causes of abnormal uterine bleeding at this time are, in order of their frequency: (1) abnormalities of pregnancy; (2) endocrine disturbances; (3) pelvic inflammations (endometriosis); (4) fibroid tumors or polyps; (5) cancer of the cervix; (6) cancer of the fundus; (7) ovarian tumors; (8) syphilis; (9) blood dyscrasias, cardiovascular, kidney and chest diseases.

1. *Abnormalities of Pregnancy.*—I have placed these at the head of the list, not only on account of their relative frequency, but for their importance from a medico-legal standpoint. There are a great many women coming to doctors' offices giving false histories in the hope of a curettage to end an unwanted pregnancy, or perhaps to obtain grounds for a fat damage suit. A careful history and physical examination will usually rule out the question of pregnancy. In some cases an Aschheim-Zondek test is necessary. Under this heading come intrauterine pregnancies with abnormal bleeding, placenta praevia, threatened or missed abortion, ectopic, retained placenta, hydatidiform mole, and the rare chorio-epithelioma.

2. *Endocrine Disturbances.*—These must be considered in all cases where there are no definite lesions demonstrable. Study of the endometrium is of vital importance. A fairly frequent cause of abnormal bleeding is the so-called incomplete menstruation. The endometrial fragments not cast off remain and cause an irritation of the new endometrial lining. Minor disturbances, on biopsy, show a more or less normal endometrium, indicating a first-degree ovarian failure. The severe bleedings show a high percentage of cystic hyperplasia, indicating second-degree failure. It may occur with atrophic endometrium, indicating third-degree failure. Other more serious causes must be eliminated before a diagnosis of endocrine dysfunction is made. Some years ago a 34-year-old patient, who had been studied in a hospital, was referred to us from an Eastern clinic. To quote from her physician's letter: "The possibility of an intra-uterine polypus was considered, but nothing definite was found. She seemed to have functional disturbance." On curettage, we found fundus carcinoma.

3. *Pelvic Inflammations.*—Pelvic inflammations, usually of gonorrheal or puerperal origin, are very common in this age period. Under this heading should be included endometriosis, which can rarely be differentiated from salpingitis before operation. The cause of the bleeding is probably endocrine—an irritative stimulation of the ovary. Curettage in low-grade salpingitis, which cannot be diagnosed by palpation, may light up the process and cause a severe exacerbation.

4. *Fibroid Tumors.* — Fibroid tumors usually cause menorrhagia. Those that cause bleeding are most often submucous, and intra-uterine exploration with the curette may be necessary to make the diagnosis. Fibroid polyps, and mucous polyps of the endometrium or cervical mucosa, are common causes of severe menorrhagia.

5. *Cancer of the Cervix.*—Cancer of the cervix must be considered in any case of abnormal bleeding, especially in the latter half of the child-bearing period. Biopsy should be made of any suspicious area of the cervix. The bleeding varies in amount, and is always venous.

6. *Cancer of the Fundus.*—Cancer of the fundus is more common toward the end of, or after the child-bearing period. It usually causes metrorrhagia, less severe than malignancy of the cervix.

7. *Ovarian Tumors.*—Ovarian tumors, whether cystic or solid, are frequent causes of bleeding. The benign tumors rarely cause it unless they become twisted, but the malignant types usually do.

8. *Syphilis.* — Syphilis should never be overlooked. Gellhorn cites a patient with a negative Wassermann who had endocrine therapy and several curettages without improvement. Radium or surgical treatment were considered. On further questioning it was found that her father had died at forty of cerebral syphilis. Under specific treatment her abnormal bleeding promptly stopped. Two 15-year-old girls with severe metrorrhagia, who had shown no improvement under various endocrine products, were found to have positive

Wassermanns. Appropriate treatment stopped their abnormal bleeding.

9. *Blood Dyscrasias.* — The various blood dyscrasias, cardiovascular, kidney and chest diseases must be considered.

III. POSTMENOPAUSAL:

Malignancies of uterus or ovary are the most important causes of abnormal bleeding in this group. Mild bleeding may be due to atrophic or senile vaginitis, or to ulceration from foreign bodies such as pessaries or tampons.

* * *

II. DIAGNOSIS

JOHN N. EWER, M.D. (411 Thirtieth Street, Oakland).—Diagnosis of a given case of uterine hemorrhage may be extremely difficult or quite simple. Each has its cause, whether or not it can readily be identified by the means at our disposal. Such bleeding in itself is only a symptom, not a disease, and no stone should be left unturned in the search for the cause in any case in which bleeding departs significantly from the normal.

In this discussion, any abnormal genital bleeding of whatever amount, whether hypermenorrhea, polymenorrhea, metrorrhagia, or combinations of these, will be included in the term "uterine bleeding."

A complete history and physical examination, together with indicated laboratory examinations, is a *sine qua non* whenever the cause is not at once apparent. A mere pelvic examination is not enough. Moreover, the indiscriminate trial of various endocrine products without physiologic reasons for their use, and in the absence of adequate efforts at diagnosis, is to be deplored. Every gynecologist has seen valuable time lost in undiagnosed cases of cancer, ectopic pregnancy, polyposis, and other conditions which have been treated in this way. There is a fertile field for the use of these products, often in cases which in former years could only be cured by radical means, but they should be considered only where physiologists have shown them to be indicated.

There are probably causes of uterine bleeding which are as yet not recognized, but such, I believe, are not common.

It goes without saying that every case of abnormal genital bleeding should have a careful pelvic examination, always including visualization of the vulva, vagina, and cervix. Smears should be taken at this time if any evidence of infection exists. If there is possibility of a disturbance of pregnancy, it must be performed asceptically. In case a sizable tumor can be palpated abdominally, auscultation should not be neglected, as fetal heart-tones have at times been heard in "ovarian cysts" or "fibroids," or a pregnancy may coexist with ovarian or fibroid tumors.

It is easiest, I think, to discuss the diagnosis of uterine bleeding according to age groups, such as in adolescence, the period of maturity, premenopausal, and postmenopausal. A working knowledge of the normal physiology as it relates to the female genital tract is essential for the proper understanding of its aberrations; many cases, perhaps more than we now realize, of uterine bleeding are the result of endocrine dysfunction.

Abnormal bleeding in adolescence is usually upon an endocrine basis, due to disturbance in the anterior pituitary—ovary—endometrium relationships. Various special procedures exist whereby endocrine dysfunctions may be discovered, such as blood and urine hormone studies and by pathological study of bits of endometrium removed with the biopsy or suction curette. Facilities for blood and urine studies are often not available, and as yet often incompletely understood; as a rule they must be repeated at frequent intervals, because the values for hormones normally vary at different stages of the menstrual cycle. It is usually simpler to rely on endometrial biopsies. If these are taken at the right times, particularly in cases in which a cycle can be recognized, they will show definitely whether the sequence of follicle ripening, ovulation and corpus luteum formation has taken place.

It must be remembered that in the adolescent such conditions as disturbances of pregnancy, both normal or ectopic, genital sarcoma and ovarian tumors may occasionally be encountered.

During sexual maturity, complications of pregnancy should always be considered first. The date of the last menstrual period and its characteristics should be determined. Threatened or incomplete abortion, ectopic or mole pregnancy must be kept in mind. If in doubt, the Friedman test for chorionic hormone may prove valuable; but it will become negative within one to two weeks after the death of fetal elements.

Any bleeding after a mole pregnancy certainly, or hemorrhage occurring a few weeks following a normal pregnancy or abortion, should be checked by means of a Friedman test to rule out the occasional case of chorio-epithelioma. Here the curette is not conclusive in the absence of positive findings; nodules may be deep in the uterine musculature or in even more remote locations. Furthermore, it is not considered best to disturb these growths if the diagnosis can be made otherwise.

Decidua without chorionic villi, obtained by the curette, is pathognomonic of ectopic pregnancy, but many cases do not show this feature. Retention of secundines is the most frequent cause of hemorrhage postabortum or postpartum.

During this period of life functional bleeding can also occur, but less often than at the extremes of menstrual life. Such bleeding is now regarded as endocrine in nature; diagnosis is made, in addition to the usual history and physical examination, by such procedures as endometrial biopsy, hormone assays and the determination of the basal metabolism. Hypothyroidism, usually not of severe grade, is a frequent finding; it should be specially sought for in all cases.

Most abnormal bleedings during these years, however, have an anatomical basis. Uterine fibroids, particularly those in submucous location, cervical or endometrial polypi, adenomyomata or adenomyosis, account for many cases, and if present will almost always, sooner or later, cause some sort of abnormal bleeding. Subinvolution postpartum and

cervical lacerations may also be responsible. Various types of ovarian cysts, depending upon their endocrine influence or upon the fact they may cause local circulatory disturbance, can cause abnormal bleeding.

Many acute or subacute cases of pelvic inflammatory disease cause hypermenorrhea, and not infrequently metrorrhagia as well. An acute cervicitis often bleeds a little, particularly if traumatized.

The sedimentation rate is of much value in differential diagnosis in many of the less obvious cases, and is not used as often as it should be. The rate is moderately increased in pregnancy, and is fast in acute pelvic inflammatory conditions. It has often settled the diagnosis between salpingitis and tubal abortion, since both conditions usually show the symptoms of pain, rise of temperature, leukocytosis, and a pelvic mass. To most of us, who feel that no case of acute pelvic inflammatory disease should be operated upon, this simple test has been most reassuring. Uncomplicated fibroids and ovarian cysts cause no change in the sedimentation rate.

Toward the end of the period of sexual maturity cases of hemorrhage from the uterus again become more frequent and severe, and again the endocrine factors assume an increasingly important part in their causation. Bleeding at this time, associated with endometrial hyperplasia, can be extremely profuse. Experimental work so far seems to show the ultimate cause to lie in disturbance of production of the luteinizing factor of the anterior pituitary. The endometrium shows a prolonged or increased estrin effect, often to the point of the "Swiss cheese" pattern as described by Novak. Microscopic sections of the endometrium usually furnish the final diagnosis in such cases, but it must be remembered that bleeding can occur at times from almost any type of endometrium.

The question of malignancy appears during the period of sexual maturity, but with increasing frequency as the years pass. Of types of cancer causing genital bleeding, that of the cervix is the most common, but carcinoma of the uterine corpus is being found more and more frequently before the menopause, particularly in women with fibroids. The incidence of cystic and solid carcinomata of the ovary increases as age advances, although the granulosa cell variety is now being reported equally often before the menopause.

Malignancy is usually diagnosed by means of the history and pelvic examination, and confirmed by microscopic examination of tissue. It must be emphasized again that no pelvic examination should be made without the use of the speculum. Biopsy from the cervix can be taken at the office from any suspicious case, with thorough cauterization of the area immediately following. If carcinoma is grossly obvious, however, it is better to defer the biopsy until the time of treatment.

After the menopause most of the causes heretofore mentioned may bring about uterine bleeding, but now malignancy assumes the commanding rôle; endocrine factors, except in so far as they may be present as a result of certain benign or malignant tumors of the ovary, fade into the background.

Most gynecologists feel that every case of metrorrhagia before the menopause, and any bleeding thereafter, should have thorough curettage for microscopic diagnosis, unless contra-indications exist or the cause of the bleeding be readily apparent. Carcinoma of the corpus is almost always diagnosed in this way, and if hyperplastic endometrium is found in a woman past the menopause an ovarian tumor must be ruled out.

In old women with senile atrophy of the genitalia, bleeding, especially after trauma, may come from an adhesive type of vaginitis, but it must be remembered that cancer of the uterus can coexist.

There remain various causes of bleeding from the uterus which may be sought for if the results of examination at any age do not explain its nature. Various cardiac conditions with chronic passive congestion of abdominal organs, certain cases of hypertension, and rarely hepatic cirrhosis, as well as the hemorrhagic types of blood dyscrasias, may be associated with uterine bleeding. Among the acute infectious diseases, pneumonia, typhoid, and influenza, or constitutional disease such as diabetes, scurvy or lues, may be an occasional offender.

* * *

III. TREATMENT

Margaret Schulze, M.D. (University of California Medical School, San Francisco). — The treatment of menorrhagia is one of the most troublesome problems in gynecology. The bleeding may be controlled readily enough, but to do this without destroying functional activity in the young individual or causing sequelae far more distressing to the patient than the menorrhagia itself may at times be exceedingly difficult.

A first essential to the treatment is an accurate diagnosis, and this must include a careful general examination with a survey of the endocrine system, and at least a basal metabolism and perhaps other functional studies. A careful pelvic examination must be done to rule out gross anatomic lesions, and a microscopic study of the endometrium is essential. When the bleeding is definitely cyclic in character but merely profuse and prolonged, an office biopsy without anesthesia may be sufficient; but in all cases where irregularity of the bleeding suggests the possibility of malignancy, and certainly in all older patients, a careful and complete curettage under anesthesia must be done. Nothing can be more reprehensible than the long-continued endocrine or other general treatment for menorrhagia before malignancy is definitely ruled out. In certain cases of bleeding, particularly those due to the so-called incomplete shedding of the endometrium, curettage may be curative, and certainly its results should be awaited in all cases of menorrhagia of recent origin before proceeding to other treatment which may be crippling in its sequelae.

Certain women with menorrhagia may have had bleeding so long-standing and so severe that they are extremely anemic when they first appear. Such patients should be transfused before other types of treatment are proceeded with. Occasionally, in the adolescent, menorrhagia, transfusion may be curative.

Gross anatomic lesions are, of course, dealt with according to well-recognized surgical principles and usually require operative treatment. Bleeding, associated with salpingo-oöphoritis which does not respond to the ordinary conservative measures, including bed rest, will usually be controlled by intravenous injections of Congo-red. One injection of ten cubic centimeters of the sterile isotonic solution may be sufficient, but occasionally two or three at two-day intervals are required.

In the treatment of functional menorrhagia, the number of therapeutic procedures which have been introduced is legion—sufficient evidence that none of them is ideal. These methods have been divided by Keene and Payne into seven groups: (1) hygienic measures; (2) uterine stimulants; (3) means to increase coagulability of the blood or to decrease the permeability of the capillaries; (4) endocrine therapy; (5) removal or destruction of the endometrium; (6) roentgen or radium therapy; and (7) surgical procedure upon the ovaries or the uterus. A most important fact, which has been repeatedly emphasized by Frank and has been borne out by observations in our own clinic, is that many of these functional disturbances, even those of severe type, are of transient nature and tend to spontaneous cure, and therefore too radical treatment is entirely unjustified and may do far more harm than good. If the patient, particularly those in the younger age groups, can only be tided over her periods of bleeding for a certain length of time, the condition will tend to correct itself.

Hygienic measures include the relief of dietary insufficiency, particularly that of protein and of vitamin C, the correction of secondary anemia and the removal of focal infections.

Uterine stimulants, including pituitrin, ergot preparations, extracts of hydrastis, and stypticin, may help tide the patient over periods of active bleeding, although they do nothing to influence the underlying condition.

Blood coagulants and endothelial stimulants have been used too recently, and in series too small to permit a final evaluation, although excellent results have been reported in about two-thirds of the cases with Congo-red by Rossak, Deinhardt, and others. Our own experience in the use of this substance has been limited to cases of bleeding associated with salpingo-oöphoritis, where the results have been satisfactory. Peck and Goldberger have reported good results in ten of twelve cases treated by the subcutaneous injection of moccasin venom.

Although functional menorrhagia is admittedly an endocrine disturbance, results with endocrine preparations which theoretically should be effective have been somewhat disappointing.

Thyroid extract remains the most valuable of these, and since it is simple to use, inexpensive and frequently effective, should be given a trial in all cases showing a slightly lowered or even normal basal metabolism. It is successful in a considerable proportion of adolescent menorrhagias, and may be useful even in preclimacteric bleeding.

Theoretically, since a high proportion of these cases show hyperestrinism and an absence of the corpus luteum, the newer potent corpus luteum extracts should be effective; but, clinically, our results with them have been disappointing, whether or not because of insufficient dosage of this very expensive preparation, we cannot say.

Urinary prolan preparations have not given, in our hands, the brilliant results reported by Novak and others, but may be effective and are worth trying. Two hundred rat units are given daily until the bleeding ceases, or until ten injections have been given. Some authorities continue with a one hundred rat unit dose at three-day intervals in the intermenstrual period, while others await the next period and repeat the treatment as frequently as necessary.

The indications for curettage have already been discussed. Destruction of the endometrium by other methods, such as steam vaporization or chemical caustics, are mentioned only to be condemned, since they may be attended by disastrous sequelae or even death.

More radical operative treatment, such as hysterectomy, should almost never be done, although in certain rare cases in relatively young women who have exhausted all the other therapeutic possibilities it may be considered less radical than the production of the premature menopause by radiation. The possibilities that long-continued hyperestrinism may be due to a granulosa cell tumor so small that it has been overlooked should always be borne in mind. In such a case, brilliant results will follow its removal.

The results of a follow-up study of cases of menorrhagia treated with radium have led to a sharp limitation in its use, and we now practically never employ it in young women or in any case where the production of an artificial menopause would be undesirable. The menorrhagia can practically always be controlled, but sometimes with sequelae far more distressing to the patient than was her bleeding. The feeling that normal periods can be restored by small dosages was shown to be fallacious, since this result was obtained in only 35 per cent of women under thirty-five and 7 per cent over this age. Although in general the results were fairly uniform, the individual variation in response was so great that it was quite impossible to predict the outcome. Small doses used cautiously often necessitated further treatment, yet bleeding sometimes continued after large repeated doses, while permanent amenorrhea was in some cases produced by less than 500 mch. Dyspareunia, due to vaginal atrophic changes, frigidity and sterility, were a frequent source of complaint; the latter, of course, probably often primary, but attributed by the patient to the treatment. Severe menopausal symptoms were not frequent in our series, and did not seem proportional to the dosage as maintained by Keene and Paine. However, even women near the menopausal age were sometimes intensely dissatisfied by the sudden cessation of their functional activity when they had not understood that this might happen. Since curettage to eliminate malignancy is so urgently indicated in all this group and a menopausal dose of radium is curative, it seems logical to administer it at once and most patients are entirely satisfied to have this done. In

fact, our most grateful patients were in this group, many stating that they had never felt so well. However, once malignancy has been eliminated, there is no great risk in conservative treatment; and although radiation will eventually be required in most of this older group, the patient will be far more satisfied if she reaches this conclusion herself. A careful explanation of the whole situation, with the patient making her own choice, is desirable. Roentgen irradiation gives results very similar to radium, but since a curettage is urgently indicated in any case before radiation it is simpler to complete the treatment with one dose of radium intra-uterine, unless there are contra-indications to radium, as with previous pelvic peritonitis or postoperative adhesions, when there might result serious damage to an adherent loop of intestine.

The treatment, therefore, in the young individual should exhaust all possible palliative methods, of which there are many, before resorting to radical operative or radiation therapy; while, in the premenopausal group, radiation gives almost ideal results, provided the patient understands clearly what these results will be.

New York's New Nurse Practice Law.—New York's legislative tussle ended April 6, 1938, when Governor Lehman signed its new Nurse Practice Act. It has been watched with keen interest by nurses all over the country, not only because many are considering a revision of the laws in their own states, but because thousands of persons are affected by the provisions of the Act.

The Nursing Information Bureau has received numerous inquiries about the new law. All are referred either to Miss Stella Hawkins, Secretary of the New York State Board of Nurse Examiners, State Education Building, Albany, or to Miss Emily J. Hicks, Executive Secretary of the New York State Nurses' Association, 152 Washington Avenue, Albany, New York. Both have all details about the bill and its interpretation at their finger's tips.

An informal statement about the major provisions of the Act follows:

The Act defines nursing practice. It becomes law July 1, 1938. However, nurses now practicing but not licensed, are granted two years' time in which to become licensed. In other words, after July 1, 1940, all who wish to practice nursing for hire in New York State, must be duly licensed. If they are not, they will be subject to substantial fines or imprisonment.

Two classes of licenses will be issued: one to practice as a registered professional nurse; one to practice as a practical nurse.

The letters R. N. may be used by registered professional nurses only. No letters, figures or words other than "practical nurse" may be used to designate a licensed practical nurse.

Citizenship is a requirement for registration. However, if a nurse is not a citizen but has declared her intention to become one, a license may be issued, but will be void at the end of seven years if the holder has not become a citizen of the United States.

Who are eligible for R. N. licenses: In general, all nurses who wish to be registered professional nurses must meet specified requirements of age, preliminary education, citizenship and character, and the course in nursing which they had must be considered satisfactory by the New York State Department of Education. In addition:

1. All nurses who are New York State registered nurses on July 1, 1938, will be considered registered professional nurses when the Act becomes effective on that date.

2. Nurses who are graduates of schools of nursing which have been registered by the New York State Department of Education, will be eligible for licensing as registered professional nurses.

3. For the two-year period—July 1, 1938, to July 1, 1940—nurses whose preparation and experience are considered satisfactory by the New York State Department of Education, may be licensed under a special waiver. Space does not permit a complete statement about its provisions in this bulletin. One of them, however, affects so many nurses throughout the country that it is included:

Graduates of schools of nursing, accredited in any other state, province or country, who meet all except the residence requirements, may take New York State Board examinations. If they pass them, they will be licensed as registered professional nurses.

Inquiries about the other provisions should be sent to the New York State Board of Nurse Examiners.

Who are eligible for the practical nurse licenses: In general those who wish to be licensed practical nurses, must meet specified requirements of age, character, citizenship and preliminary education (completion of the eighth grade or its equivalent); they must be graduates of registered schools for practical nurses, which give at least a nine months' course in practical nursing; and they must pass examinations.

A special waiver, effective from July 1, 1938, to July 1, 1940, provides for the licensing of trained attendants and of those who have rendered satisfactory service over a given period of time.

Mesenteric Vascular Occlusion.—The study Lorin D. Whittaker, Peoria, Illinois, and John de J. Pemberton, Rochester, Minnesota (*Journal of the American Medical Association*, July 2, 1938), present is based on a consecutive series of sixty proved cases of mesenteric vascular occlusion seen at the Mayo Clinic, in fifty-seven of which necropsy was performed; in the remaining three cases surgical procedures performed for the occlusion were survived. There were thirty-six cases (60 per cent) in which mesenteric vascular occlusion was unrelated to any previous surgical procedure and, of this group, only sixteen patients (two of whom survived) were subjected to abdominal exploration; the condition of the remaining twenty patients did not warrant surgical intervention. There were twenty-four cases (40 per cent) in which mesenteric vascular occlusion followed some operative procedure (splenectomy, appendectomy, herniorrhaphy and the like) and, of this group, only three patients were subjected to reëxploration. Reexploration was not made either because of the patient's immediately poor condition or because it was felt that operation offered no hope for recovery. Of the three cases in which reëxploration was carried out, in one the reëxploration followed an operation on the biliary tract; a volvulus was released on the fifth postoperative day and recovery followed. Thrombosis of the vessels which supplied two feet (70 centimeters) of ileum had occurred. In the second case, reëxploration followed splenectomy for splenic anemia. Enterostomy was performed on the twenty-seventh postoperative day; the jejunum was found discolored. Venous thrombosis continued to the extent of completely blocking the superior mesenteric and portal veins; death occurred on the twenty-ninth postoperative day. In the third case reëxploration followed hysterectomy. On the eighth postoperative day an internal hernia through the transverse mesocolon was reduced; the lower part of the ileum was discolored, and thrombosis of the superior mesenteric artery and vein progressed to the extent of complete involvement. Death occurred on the tenth postoperative day. The mortality rate in the entire group was 95 per cent; the mortality rate of patients operated on for occlusion was 84.2 per cent. The incidence of involvement of the superior mesenteric artery as compared with that of the superior mesenteric vein compares closely with the relative incidence reported by other authors. Involvement of the inferior artery in one case and of the inferior vein in two cases presents a rather high incidence of such involvement. The source of mesenteric vascular occlusion varies as to whether the artery or the vein is involved. Occlusion of the superior mesenteric vein occurs secondary to ascending thrombosis usually attributable to infectious processes, secondary to descending thrombosis from the associated portal vein or secondary to hepatic disease, or it follows an abdominal surgical operation. Hepatic cirrhosis was noted in some cases of splenic anemia and may have been contributory to thrombosis in these cases following splenectomy.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

COUNCIL MINUTES*

Minutes of the Two Hundred and Sixty-fifth and Sixty-sixth Meetings of the Council of the California Medical Association

Minutes of Council meetings are printed after their approval by the Council. The minutes of the two hundred and sixty-fifth meeting (organization meeting) and of the two hundred and sixty-sixth meeting (special meeting) will be considered by the Council at its September meeting and will be printed in the October issue of the Official Journal.

CALIFORNIA MEDICAL ASSOCIATION AWARDS FOR SCIENTIFIC EXHIBITS AT THE PASADENA ANNUAL SESSION, MAY 9-12, 1938

The Council's Committee on Scientific Exhibits (Doctors Lemuel P. Adams of Oakland, Mast Wolfson of Monterey, and E. B. Dewey of Los Angeles) made the following awards for scientific exhibits presented at the Pasadena annual session of the California Medical Association.

First prize, $100, to Dr. G. Mosser Taylor of Los Angeles for his exhibit, "Manipulative Surgery."

Second prize, $60, to Dr. Roger W. Barnes of Los Angeles for his exhibit, "Models of the Prostate."

Third prize, $40, to C. M. Hyland of Los Angeles for his exhibit, "Convalescent Serum."

PROPOSED CHIROPRACTIC INITIATIVE

At the time of this writing, word has come to us from unofficial sources that a proposed initiative to amend the existing Chiropractic Practice Act of California—which was adopted by vote of the electorate some years ago—would *not* be on the November 8 general election ballot, because of insufficiency in the number of legal signatures required. The lacking signatures are of sufficient number to indicate that at this late day, in the rush of other initiative petition distribution, the needed signatures may be rather difficult to secure.

One of the announced purposes of the proposed initiative was the elevation of the number of undergraduate student hours to the 4,000-hour level. With the legalization of a curriculum on such a basis, it would probably have only been a matter of time until other amendments to provide for special "physicians and surgeons' certificates for chiropractors" would be brought forward.

For the present, such an effort, if it was under contemplation, must bide for a later time. For which, both the public and the profession should be grateful.

OUR OBLIGATIONS PRIOR TO THE CALIFORNIA PRIMARY ELECTIONS

California's primary election will take place on Tuesday, August 30, a date about two weeks distant from the time on which the August issue of the Official Journal will be in the mails.

The final or general election will be held on November 8, 1938 (second Tuesday in November).

The fifty-third session of the California Legislature (Assembly and Senate) will convene at Sacramento in the first week of January, 1939.

• • •

The above dates are full of significance for the medical profession of California.

It is true that what will take place in next year's 1939 Legislature, as regards medical practice and public health standards for California, will depend in part upon the trend of elections on November 8, 1938, but even more on who may be selected as the official nominees of the Democratic, Republican and Progressive parties on Tuesday, August 30, 1938.

However, the importance of the Primary Election of Tuesday, August 30, is the thought these comments would particularly emphasize.

If, on that day, citizens could be nominated who are not antagonistic to the medical profession and the principles which its members hold in the matter of public health and medical practice statutes, and who will be happy to listen to the advice of physicians, then worry concerning the ballot count in the November election or the 1939 biennial session of the California Legislature would be greatly lessened.

Even though the present plea comes to the component county medical societies and the members of the California Medical Association only two weeks or so in advance of the primary election of August 30, much effective work for eligible and desirable candidates may still be done!

• • •

Now, what are some of the things to keep in mind concerning the work referred to, and in which every member of the California Medical Association should be interested? Should not items such as follow be remembered?

1. Who are the foremost candidates of the respective parties for offices of the assemblyman or senator in your own district?

2. Do you know aught of their background: in business, social or civic affairs?

3. Do you know any of them personally, or have you a friend or friends who know any of them with any degree of intimacy?

* The minutes of the two hundred and sixty-first, two hundred and sixty-second, two hundred and sixty-third, and two hundred and sixty-fourth meetings of the Council of the California Medical Association were printed in the July, 1938, issue of CALIFORNIA AND WESTERN MEDICINE, page 82.

4. Do you know whether they have family physicians; and if so, the names of the family physicians?

5. In your opinion, do they properly qualify for public office, as lawmakers?

6. Are you acquainted with their attitude on public health and medical practice matters?

7. Are they persons who have a kindly reaction to the medical profession and who would listen to, and give friendly consideration to the advice of physicians?

8. Do you intend to become personally acquainted with any of the candidates?

9. If you do contact the candidates whom you think you would prefer to support, is it your intention to let them know you are interested in their candidacies, and that you will be glad to keep them in touch with public health and medical matters, without either making or requesting promises?

10. If you know the family physicians of candidates, will you pass on to such colleagues the importance of the relation they bear, and the great aid they could be?

11. After learning about candidates, in case information of interest is passed on to you, do you intend to transmit the same promptly to your local Committee on Legislation and Public Policy, and to the State Association Committee, either directly or through the central office of the California Medical Association, Room 2004, 450 Sutter Street, San Francisco?

12. Is it part of your intention to ask fellow physicians, friends and patients to vote and work for the election of candidates who, as assemblymen or senators, could be safely relied upon for sound judgment and action on public health and medical practice matters?

• • •

The above may seem an appalling list of responsibilities in a matter not intimately connected with your personal practice; but if neglected, it is possible that you and your fellows may be called upon to give a vastly greater amount of time and effort to safeguard that very personal practice. We live in a rapidly changing world. All kinds of propaganda are in the air, and citizens without number have been so misled in their thinking that where in past years they could have been counted on for coöperative endeavor, today they are hesitant, distrustful, or even antagonistic.

• • •

To repeat:

The date of the California primary election is Tuesday, August 30.

Do your personal part, along lines indicated in the twelve points outlined above.

Pass on the information you secure to your local officers or committee, or to the State Association secretary, or to the State Association chairman of the Committee on Legislation and Public Policy. (The addresses of the State Association officers are printed in every issue of CALIFORNIA AND WESTERN MEDICINE, on advertising page 2.)

When you help in this, you help yourself, your colleagues, the medical profession and the public.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

Joint Meeting of Solano, Sonoma, Napa and Marin County Medical Societies

Solano County Medical Society was the host unit for the Saturday, July 16, dinner meeting, with Sonoma, Marin and Napa county medical societies as the guest units, held at the Vallejo Yacht Club in Vallejo. About one hundred members from the four societies turned out, the occasion being honored by the presence of President W. W. Roblee of Riverside, President-Elect Charles A. Dukes of Oakland, and three past presidents, Doctors George G. Reinle, Robert A. Peers and George H. Kress.

Dr. Ream S. Leachman, president of the Solano County Society, opened the conjoint meeting, turning over to Secretary John W. Green the honor of introducing the guests from Mare Island Navy Yard, county and city officials from Solano County, and visiting physicians from San Francisco and other counties. An orchestra, entirely composed of physicians and dentists, under the able leadership of Lloyd E. Kindall of Oakland, entertained with popular and classical music. A vocal and dancing floor show added to the other enjoyable features. President-Elect Charles A. Dukes gave the major talk of the evening, but President Roblee, Councilor Henry S. Rogers of the Ninth District, and Association Secretary Kress also made informal speeches on organization needs and topics. Dr. James W. Morgan acted as master of ceremonies for the entertainment program. Dr. Jefferson Larkey conducted a symphony, all his own. The evening was voted a big success by all who were in attendance.

The photographs printed on page 156 in this issue of the Official Journal are ample evidence of the good time and fellowship.

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. George G. Reinle of Oakland is the chairman and Dr. George H. Kress is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. George H. Kress, Room 2004, Four Fifty Sutter Street, San Francisco.

Migratory Agricultural Workers in California: Their Influx an Increasingly Grave Problem for the State*

When more than 220,000 persons—men, women and children—enter a commonwealth within the short period of two and one-half years, to pursue a type of migratory existence, there immediately arises a problem neither unimportant nor neglible.

When, in addition, the great majority of these itinerants are both impoverished and undernutritioned, living from hand to mouth and moving from place to place in an effort to find work in one form or another in agriculture, for which, by previous experience, they may or may not be fitted, a solution of the problem becomes more difficult.

And then, when certain other factors come into play the economic, social welfare, medical and political responsibilities involved in the advent of these newcomers must at once become apparent. These factors are:

1. Lack of required legal residence that would entitle them, even though indigent, to treatment in county hospitals;

2. Indifference on the part of many of these persons to make an effort for themselves, or to find shelter with proper sanitary conveniences; and an

3. Incapacity, observable again and again, on the part of the women folk in particular, to prepare for routine meals those vegetables and fruits with which California abounds, and which the undernourished bodies of such wandering individuals are so often and so sorely in need.

Even though it be true that California is a great state, with inherent natural resources, and a citizenry able to meet almost any and all kinds of complications, it still must be evident that under conditions like those noted above our commonwealth may be faced with problems demanding for their solution extensive reserve resources of a material nature, as well as a broad and clear outlook from both state and local officials. For upon them rests the responsibility of guiding aright, into useful California citizenship, these émigrés—largely of North American stock who have come here, mostly from Missouri, Kansas, Arkansas, Oklahoma, Texas and Arizona—to take up residence and find for themselves and their families an honest livelihood.

That the situation is more than an interstate matter is evidenced by the coöperation already given by the Federal Government in an effort to solve the vexed problems. This was indicated in a report by Dr. Karl L. Schaupp, San Francisco, recently made to the Council of the California Medical Association, and printed on page 460 in the June issue of the Official Journal.

In the coöperative plan that has been developed during the last several years, federal agencies such as the Resettlement Administration of the U. S. Department of Agriculture (now the Farm Security Administration) and the U. S.

* EDITOR'S NOTE.—After this article concerning migratory workers was sent to the printer, an item on a political phase of the problem appeared in the San Francisco *Chronicle* of July 26. It is reprinted in this issue, on page 170.

Dinner of Solano (hosts), Sonoma, Marin and Napa County Medical Societies, at Vallejo Yacht Club, July 16, 1938. Guests at table, left to right: Norman Leet; Hartley F. Peart, legal counsel; Jefferson Larkey; Robert A. Peers, M.D., ex-president; Charles A. Dukes, M.D., president-elect; William W. Roblee, M.D., president; George H. Kress, M.D., Association secretary; Henry S. Rogers, councilor, Ninth District; Admiral David W. Bagley, commandant, Mare Island Navy Yard; Mayor Fred Heegler of Vallejo; Captain E. E. Curtis (M.C.), U.S.N., executive officer, Naval Hospital, Mare Island; Thomas O'Hara, president, Vallejo Chamber of Commerce; and Captain Grier Duncan, U.S. Navy.

Public Health Service, working with the California State Board of Public Health Service and the State Relief Administration, have united to form a nonprofit corporation known as the "Agricultural Workers' Health and Medical Association," the Federal Government allocating for its use the sum of $100,000. One of the seven members of the board of directors of this corporation, representing thereon the California Medical Association, is Dr. Karl L. Schaupp, the other physicians on the board being Doctors Albert E. Larsen, Medical Director of the State Relief Administration, and William R. P. Clark of the California State Board of Public Health.

This conjoint federal-state-civic organization—if it may be so styled—is the first body of its kind to be formed in the United States. California was selected, no doubt, because of the bigness and urgency of the problem of special migratory agricultural workers, as here briefly discussed. The implications involved in the situation, as it exists, and the plans made to combat the complications therewith associated, make the solution of more than passing interest. To for-

Dr. Lloyd Kindall's Orchestra of Doctors and Dentists.—Seated, left to right (front row): James W. Morgan, Jefferson Larkey, Lloyd Kindall; (upper row), Charles Greenwood, Edward Greer, Robert Taylor, Forrest Horner, Fred Hitchcock, Fred Fisher, William Stratton, Norman Leet; (standing), Lee Garron, Ted Redewill. (Photograph taken at the dinner of Solano (hosts), Sonoma, Marin and Napa County Medical Societies, at Vallejo Yacht Club, July 16, 1938.)

ward such a possible solving, the California Medical Association Council called into conference at San Francisco, on February 2, the secretaries or other representatives of twenty county medical societies from sections of the state where this problem was attracting more than ordinary attention. The attention of all members of the Association is now directed anew to the subject because future phases may be even more grave than those of the present.

The State Association headquarters requests component county societies to send to 450 Sutter Street, San Francisco, press or other reports, as work in connection with these migratory farm laborers goes forward.†

Have County Hospitals Legal Right to Make Hospitalization Charges to Indigent Patients? A Negative Opinion*

Dear Doctor:

I have read with interest the opinion of Deputy County Counsel L. K. Vobayda [of Los Angeles County] dated May 23, 1938, and addressed to the Board of Supervisors of the County of Los Angeles, a copy of which you forwarded to me. In accordance with your request, I will submit herein my reaction to the County Counsel's opinion.

* * *

In the first place, it is an exhaustive review of the California statutes relating to county relief and is an illuminating explanation of the collection methods followed in Los Angeles County and the reasons therefor. There is only one assertion contained in the opinion with which I disagree, but inasmuch as the particular statements concerned go to the heart of the opinion, I believe that I had better explain in detail my reasons for holding a contrary view.

The opinion of Deputy County Counsel Vobayda assumes throughout that Division IV of the California Welfare and Institutions Code, which is entitled: "Indigent Persons," and which contains those statutory provisions formerly found in the "Pauper Act of 1933," constitutes a specific grant of authority to all counties to collect after acquired property from persons receiving medical services and hospital care in county hospitals and that it is within the power of boards of supervisors to determine whether to operate county hospitals under said Division IV of the Welfare and Institutions Code or under Division I, Chapter III, of the same code, which is entitled: "Local Administration" and which contains specific sections relating to the government, management and control of county hospitals. For example, the following statements are found in the opinion:

"This is true because reimbursement for aid given in the general hospital of this county is governed by the Public Welfare Act, due to action of your board embodied in Sec. 4 of the Rules Ordinance making the Public Welfare Act applicable thereto,"

and

"It seems clear, beyond controversy, that the County of Los Angeles in administering hospital care is administering same under the provisions of the Public Welfare Act, which provides a liability upon an indigent for reimbursement if he acquires property after the aid is rendered to him and which consequently makes it the duty of the county to collect."

I am forced to disagree with these statements and with the assumption that the furnishing of medical services and hospital care to people who are actually ill or injured is governed by those sections of the Welfare and Institutions Code which relate to county aid and relief to indigents. In addition, I am forced to disagree with the statement that the board of supervisors of Los Angeles County or of any other county can determine by ordinance what general laws of the state they undertake to follow and what general laws they intend to deem inapplicable. Such determination is a matter for the legislature in the first instance and the courts thereafter, if legislative intent is not fully apparent.

As pointed out in the opinion of Deputy County Counsel Vobayda, Sections 200–203, inclusive, of the Welfare and Institutions Code (which were formerly Sections 4041.16 and 4223 of the Political Code) provide specifically for the erection and maintenance of county hospitals and the care and maintenance therein of indigent sick and dependent poor persons. These sections are permissive in nature, that is to say, county boards of supervisors may, if they so desire, erect and maintain county hospitals and may prescribe rules for the government and management thereof. But if a board of supervisors does maintain a county hospital, it must provide medical care and hospital facilities therein only to those persons in the county who are indigent sick or dependent poor. This point was decided in

Goodall vs. *Brite*
11 Cal. App. (2d) 540,

and a definition of the phrase "indigent sick or dependent poor," as used in Section 200, is contained in the opinion.

Sections 2500, 2600–2604, inclusive, of the Welfare and Institutions Code (these sections were formerly contained in the Pauper Act—Deering's General Laws, 1933, Act 5815) provide in substance that every county *must* support all residents therein who, by reason of poverty, incompetency, age, disease or accident are unable, through their own resources or through relatives or friends to provide necessary food, clothing and shelter. These sections also provide that where a county does grant aid and relief to its poor persons, it is entitled to take from such persons such property as they may have and such property as they may thereafter acquire—at least to the extent necessary to reimburse the county.

It is my opinion that the furnishing of medical care and hospital facilities to those indigent persons who are sick and injured in the county hospital is exclusively governed by Sections 200–203 of the Welfare and Institutions Code and that Sections 2500, 2600–2604 concern only the *support* of the poor by the county. An examination of Section 2500 shows that it is intended to govern incompetent persons and poor persons who are unable to provide themselves with food, clothing and shelter, and those incapacitated by reason of age, disease or accident to provide themselves with the means of livelihood. The section is quite clearly a relief measure and is not intended to affect in any manner the furnishing of medical care and hospital facilities. Section 2500 is quoted by Deputy County Counsel Vobayda, but in order to amplify my point, I shall quote it herein:

"Every county and every city and county *shall* relieve and *support* all incompetent, poor, indigent persons and those incapacitated by age, disease, or accident, lawfully resident therein, when such persons are not supported and relieved by their relatives and friends, or by their own means, or by state hospitals or other state or private institutions."

The reference to "state hospitals" is clearly intended merely to exclude from the mandatory duties of counties the support of incompetents and others committed to state institutions.

Section 2600 of the Welfare and Institutions Code, a part of the former Pauper Act, contains the phrase "while receiving public assistance" and the phrase "an applicant for public relief." Section 2603 provides as follows:

"If a person *for the support of whom* public moneys have been expended acquires property, the county shall have a claim against him to the amount of a reasonable charge for moneys so expended and such claim shall be enforced by action against him . . . The *support* of such indigent from public funds shall be deemed a ground for sale or encumbrance of his property . . . "

It is to be noted that Section 2500, Section 2600 and Section 2603 refer to "public assistance," "relief" and "support," all of which are phrases normally used in the dispensation of food, clothing and shelter to those unable to provide themselves with the same. These sections do not use phraseology consistent with an intent to govern the furnishing of medical care and hospital facilities.

In

County of Los Angeles vs. *Payne*
8 Cal. (2d) 563

the Pauper Act of 1933, now Sections 2500–2604 of the Welfare and Institutions Code, was under discussion. The case arose as a consequence of an appropriation of $1,000,000 by the Los Angeles County Board of Supervisors to provide for the direct relief of indigent persons. The Court held that

† See also "Migrant Vote" item on page 170.

* This opinion by Hartley Peart, Esq., general counsel of the California Medical Association, is a portion of a letter from Mr. Peart to Dr. George H. Kress, in reply to a request therefor. The subject discussed has an intimate relationship to county hospital administration throughout the State of California with special reference to rulings concerning the Los Angeles County Hospital. For other comment, see page 108.

For comment by a legal friend, on Mr. Peart's opinion, as here printed, see page 166.

the aid and relief of indigent residents of a county is a mandatory duty imposed upon counties by the statute in question, and that its purpose is to require counties to furnish food, shelter and necessary supplies to those persons who would otherwise be faced with want and starvation.

In

San Francisco vs. *Collins*
216 Cal. 187

the Pauper Act was likewise construed and it was there held that it required counties to furnish aid and relief to permanent paupers and to "every person coming within the terms of the statute dependent upon public assistance for the necessities of life."

Hence, it is clear that both the language of Sections 2500–2604 of the Welfare and Institutions Code and the judicial decisions construing them require the conclusion that they deal only with the furnishing of food, shelter and clothing to destitute people. Of course, it is no more than just that people in need of *relief* be required to reimburse the county if they subsequently become able so to do. For that reason the legislature has provided in Sections 2601–2604 for such reimbursement wherever possible.

As a matter of statutory construction, it must be noted that in the interpretation of statutes containing specific enumerations of things or conditions courts apply the maxim "expressio unius est exclusio alterius."

County of Modoc vs. *Spencer*
103 Cal. 498; 25 R. C. L., Sec. 229.

Hence, the enumeration of "public assistance," "public relief" and "support" exclude other matters, such as "medical care" and "hospitalization." The fact that medical care and hospitalization are fully covered elsewhere renders the application of the maxim even more certain.

There is one additional reason which impels me to disagree with Deputy County Counsel Vobayda's assertion that the Pauper Act includes medical care and hospital facilities; that is, the fact that determination of indigency under Sections 200–203 of the Welfare and Institutions Code (the sections specifically dealing with county hospitals) and under Section 2500 of the same code, may and often does require two entirely different standards. One is not entitled to county aid and relief under Sections 2500–2604 unless one is so poor, whatever the reason, that one cannot otherwise secure the very bare necessities of life, viz., food, clothing and shelter. On the other hand, one may be entitled to medical care and hospital facilities in the county hospital even though one is able to provide oneself with food, clothing and shelter. For example, let us assume that Mr. X is married, has three minor children, rents a home, earns $100 a month and has meager savings. Under the decision in

Goodall vs. *Brite*
11 Cal. App. (2d) 540,

if Mrs. X is severely injured, requiring a great deal of medical attention and several weeks' hospitalization, she may be an "indigent sick or dependent poor" person and so entitled to medical services and hospital care at county expense. At the same time, Mr. X cannot be said to be within the Pauper Act.

To sum up, it is my opinion that Sections 2600–2604 of the Welfare and Institutions Code, which authorize counties to secure from applicants for public assistance and support a transfer of such property as the applicants possess, together with a transfer of property that may be acquired in the future, only apply to persons receiving direct aid and relief under Section 2500 of the Welfare and Institutions Code. Further, it is also my opinion that persons who may be entitled to medical care and hospitalization at county expense under Sections 200–203 of the Welfare and Institutions Code may not be required to transfer to the county such property as they may possess (unless they are only partial indigents under the decision in *Goodall* vs. *Brite*, supra) and may not be required to transfer property acquired in the future unless, in addition to receiving medical care and hospitalization, they receive direct public support in the nature of food, clothing and shelter.

Very truly yours,

HARTLEY F. PEART.

June 20, 1938.
111 Sutter Street, San Francisco.

COMPONENT COUNTY MEDICAL SOCIETIES

KERN COUNTY

The Kern County Medical Society met at the Mercy Hospital on Thursday evening, May 19, with Dr. Harry Lange presiding. The minutes of the April meeting were approved as read. The secretary read the minutes of the Advisory Committee for furnishing care to migratory workers, headed by Dr. Karl Schaupp as Chairman. The coöperation of the members was requested in supplying the necessary data for the American Medical Association survey on the need for medical care. The secretary then gave a brief report on the Pasadena meeting of the California Medical Association. Dr. L. A. Packard, Councilor for the Third District, reported also on the meeting and on the action of the Council in electing Dr. George H. Kress to the combined offices of secretary-treasurer and editor for the California Medical Association.

Mr. Ben Read, Secretary of the California Public Health League, presented a report of the activities of that organization during the last meeting of the Legislature. Dr. Philip H. Pierson, Chief of the Stanford Tuberculosis Service at the San Francisco Hospital and President of the California Tuberculosis Association, spoke on *Problems in the Diagnosis and Treatment of Pulmonary Tuberculosis*. He mentioned the recent efforts in California to eradicate bovine tuberculosis which have been most successful. The rôle of the general practitioner in the early diagnosis of tuberculosis was stressed. Numerous chest roentgenograms were shown by Doctor Pierson to demonstrate various types of lesions.

The meeting was then adjourned and refreshments were served. C. S. COMPTON, *Secretary*.

MENDOCINO-LAKE COUNTY

For those who were unable to attend the Fort Bragg meeting June 25, 1938, the following is a summary of the evening's events:

The meeting was called to order at 8:30 p. m. Doctors Wolfe, Bowman, Lloyd, Wagner, Scudder, Barcklow, Cushman, Kirwin, Toller, Hill, Beil, Huntley, Huntley, Jr., and Smalley were present. Preceding was a "shore" dinner prepared under the direction of the Fort Bragg members. In the absence of President Craig, Dr. Royal Scudder presided.

Report on the Study of Medical Care showed that only about half the reports were in. The members of the committee, Doctors Kirwin, Craig, Smalley and Bowman were urged to contact the doctors in their districts and to help them get in their reports.

The correspondence from the California Society for the Promotion of Medical Research was discussed, especially by Doctor Cushman who explained that the Humane Pound Act was really a disguised antivivisectional bill and was aimed directly at the medical science. The action of the last meeting to have the members send in their contributions individually rather than for the Society to make a contribution was allowed to stand. Send your contribution to California Society for the Promotion of Medical Research, 369 Pine Street, Suite 325, San Francisco. . . .*

The County Charter was presented for consideration.

The following new members were voted upon and passed: Dr. George Loye, Dr. Joseph H. Smyth, Dr. J. E. Mooy, and Dr. George Barcklow.

Mr. Don Devin, a representative from the Lloyd Kahn and Company, Insurance Brokers, gave a long and interesting talk on the topic of medical insurance in general and the Lloyd's policy as written by them. Following this report there was considerable discussion by Doctor Cushman, Doctor Beil, and others.

The date of the next meeting was set for August 9, 1938, to be held somewhere in Lake County.

A motion was made, seconded, and unanimously passed to thank the Fort Bragg members for their entertainment. . . .* ROBERT B. SMALLEY, *Secretary*.

* Items here omitted have been placed on the docket of the Council for consideration and, pending decision by that body, will not be printed.

PLACER COUNTY

The Placer County Medical Society held its June meeting in the Children's Building at the Weimar Sanatorium Saturday evening, June 11, 1938. In the absence of President Lewis, Doctor Thoren, chief of staff of the Weimar Sanatorium, presided. There were present the following members and visitors:

Members: Doctors Thoren, Peeke, Padgett, March, Smith, Hirsch, Peers, P. D. Barnes, Atkinson, Lundegaard, Empey, Louis E. Jones, Eveleth, Flatley, and Vinks.

Visitors: Doctors Robert P. Weddle, J. A. Trolan, L. F. Seapey, and V. E. Gerke; and Mrs. Eveleth.

Following the reading of communications, the application for membership of S. F. Tobias, M.D., of Grass Valley, was read and he was unanimously elected to membership.

The application of Robert P. Weddle, M.D., of Roseville, was also read and Doctor Weddle was unanimously elected.

The applications of E. A. Casey, M.D., of Grass Valley, and of S. S. Kalman, M.D., of Roseville, were read for the first time.

The Secretary reported the death of Dr. W. A. Lavery, of Loyalton, for many years a member of the Placer County Medical Society.

Dr. L. W. Empey, of Roseville, delegate to the Pasadena meeting, reported on the proceedings of the House of Delegates and also on the Scientific Program and the Scientific Exhibit. On motion by Doctor Empey, seconded by Dr. Louis E. Jones, a Committee of Three on Malpractice Insurance was authorized.

The program of the evening was a *Symposium on Compression Therapy in the Treatment of Tuberculosis,* presented by the staff of the Weimar Joint Sanatorium.

Dr. J. A. Trolan presented a paper outlining the history and clarifying the terminology of surgical collapse therapy in pulmonary tuberculosis. His paper described the development of pneumothorax, closed and open intrapleural pneumolysis, pneumoperitoneum, phrenicectomy, and thoracoplasty. This introductory paper was followed by the demonstration of cases treated by the above therapy at Weimar Joint Sanatorium. An attempt was made to demonstrate not only the very best results but to cover the complications and unfavorable results which the various procedures entail.

Dr. E. S. Peeke presented cases of unilateral and bilateral pneumothorax; also cases showing the results of phrenicectomy alone, pneumoperitoneum alone, and phrenicectomy with pneumoperitoneum combined.

Dr. L. F. Seapy then took up the subject of the complications of pneumothorax, showing first cases of mixed tuberculosis empyema cured by aspiration, irrigation and oleothorax, and a case which did not respond to this conservative treatment nor to the Eloesser flap operation because of complicating bronchial fistula. The complication of adhesions holding a cavity open was next considered and the treatment by closed intrapleural pneumolysis shown. A case of failure with closed intrapleural pneumolysis, due to a non-collapsing blocked cavity, was demonstrated. The treatment of tuberculosis wherein pneumothorax has failed was next considered: the first subject being extrapleural pneumolysis. Two cases were shown: the space being maintained in one by wax and in the other by air. Cases demonstrating one and two stage upper posterior thoracoplasties were shown. The use of the bronchoscope in demonstrating the locale of tuberculosis and the application of bronchoscopy in discovering non-operable types was touched upon.

The technique of pneumothorax and pneumoperitoneum was then demonstrated before the group by Dr. J. A. Trolan.

Dr. Robert A. Peers, of Colfax, summarized the discussion and pointed out the advantage of showing the poor results of collapse therapy as well as those which ended in marked success.

The meeting then adjourned for refreshments.

ROBERT A. PEERS, *Secretary.*

SAN BERNARDINO COUNTY

The regular meeting of the San Bernardino County Medical Society was held at the San Bernardino County Charity Hospital, in San Bernardino, on Friday, June 3, 1938. The meeting was called to order by President Williams, at 8 p. m.

The following applications for membership were approved: Loleta Simpson, M.D.; Winston G. Nethery, M.D.; and Ralph N. Root, M.D.

The program of the evening was then given as follows:

The Management of Early and Prenatal Syphilis, as They Relate to Public Health Control, by Udo Wile, M.D., Professor of Dermatology and Syphilology, University of Michigan Medical School.

Following a round table discussion, Dr. W. W. Roblee, President of California Medical Association, spoke briefly.

The meeting adjourned at 10:30 p. m.

ARTHUR E. VARDEN, *Secretary.*

SAN MATEO COUNTY

The meeting of the Board of Directors of the San Mateo County Medical Society was held in the library of Mills Memorial Hospital at 8 p. m., on July 5, 1938.

The Secretary reported on a request he had received from Dr. Freda Meyerfeld that the County Medical Society supply her with a letter for the American Consul in Germany concerning her status as a physician in this country, in order to facilitate the entrance into America of her two nephews. This request was granted.

The Secretary read the final report of Doctor Warnshuis, past Secretary of the California Medical Association, and it was unanimously agreed to send Doctor Warnshuis a letter of appreciation of the good work he had done for the State Association and of the fine coöperation and assistance to the San Mateo County Medical Society which he had rendered.

The application of Dr. Norman D. Morrison, Jr., was submitted and the Board unanimously voted in favor of his admission to the Society.

The application of Dr. Maurice R. Oliva was submitted and the Board unanimously voted in favor of his admission to the Society.

The Secretary read a letter which was received from the San Mateo County Tuberculosis and Health Association concerning the Chest Clinic to be at the Community Hospital. The matter was referred to the Public Health Committee.

The Secretary mentioned a report which had been received from Doctor Murphy concerning the committee established by Doctor Gans to study the public health needs of the county. This letter was referred to the Public Relations Committee. . . .*

No further business was transacted and the meeting was adjourned.

J. GARWOOD BRIDGMAN, *Secretary.*

TULARE COUNTY

The Tulare County Medical Society held a regular meeting on Sunday, June 26, 1938, at Motley's Café, Visalia, California. Dr. E. R. Zumwalt presided.

This meeting was chiefly devoted to unfinished business of the current spring group of meetings. Many communications were read relative to the change in California Medical Association secretaryship. Because of our uninformed position no action was taken in this matter.

Dr. Howard W. Dueker of Lone Pine, Inyo County, was admitted to membership.

Mrs. Jewett, from the office that is furnishing aid to migratory workers through the Farm Security Administration, answered numerous questions of the various members. We were asked to appoint an advisory committee from the Tulare County Medical Society.

* Upon the advice of the legal counsel of the Association, and pending consideration by the Council of the Association, the item here omitted will not be printed.

Dr. Ellis Sox, newly appointed full time Tulare County Health Officer, outlined his proposed program and asked for our coöperation.

Following these short talks the meeting was turned over for general discussion relative to the County Hospital program. By show of hands nineteen of the twenty-seven members present signified their willingness to continue on the visiting staff.

A motion was made, seconded and carried that a committee of two be appointed to meet with the Board of Supervisors to determine the policy at the County Hospital for the coming year. At their discretion this committee is to recommend the appointment of a full time business manager to the Board. Dr. Austin Miller and Dr. I. H. Betts were named to this committee.

The following summation of suggestions were variously offered:

1. That a business manager be secured for the hospital.
2. That a new hospital staff board be appointed.
3. That a full time pharmacist be employed and a hospital formulary be worked out.

The following were present: Doctors Burton, Fillmore, A. Bond, Barber, N. Miller, Lipson, Neal, Weiss, A. Miller, Matthias, Zink, Watke, Falk, Guido, Betts, Zeller, Rosson, Ambrose, Preston, DeBusk, Seiberth, Zumwalt, Sox, Powell, Cronemiller, Ginsburg, P. Miller, Brigham, and Mrs. Jewett.

The meeting adjourned at 11 p. m.

KARL F. WEISS, *Secretary-Treasurer.*

✲

VENTURA COUNTY

The regular monthly meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Tuesday, June 14, 1938.

There were seventeen members present. Guests included Doctors C. E. Ebert, Harker, Norton, Moore, Gilman, Bishop, and Witten.

Dr. C. E. Ebert, of Los Angeles, addressed the Society on *Pitfalls for the General Practitioner in the Practice of Urology.* This was followed by the business meeting.

Dr. Olive P. Walton, of the Ventura School for Girls, was unanimously elected to membership in the Society.

Announcement of the campaign for additional members by the Medical Society of California was made by the Secretary. Also, a brief report of the Pasadena Convention was given by the delegate. Doctor Smolt moved, and Doctor Mosher seconded, that the delegate withdraw funds to cover expenses in Pasadena. Carried.

After a brief discussion Doctor Shore moved that the Society go on record as favoring the formation of a Woman's Auxiliary in the county if the ladies are in favor of organizing such a unit. Seconded by Dr. D. G. Clark. Carried.

The program chairman was instructed to arrange a joint meeting with the ladies in the fall to discuss this problem.

The following were appointed as a committee to evaluate the facts gained from the recent survey on medical care: Dr. D. G. Clark, Chairman; Doctor Drace, and Doctor Nelson.

Dr. D. G. Clark moved that the July and August meetings be omitted. Seconded by Doctor Homer. Carried.

Meeting adjourned. A. A. MORRISON, *Secretary.*

CHANGES IN MEMBERSHIP

New Members (25)

Fresno County

James Melvin Arthur — Charles S. Mitchell
F. Harold Downing — Omar U. Need

Guido F. Norman, from Humboldt County to San Francisco County.

In Memoriam

Crabtree, Winston Churchill. Died at San Diego, July 14, 1938, age 36. Graduate of University of Michigan Medical School, Ann Arbor, 1928. Licensed in California in 1929. Doctor Crabtree was a member of the San Diego County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✝

Hanlon, Edward Russell. Died at Los Angeles, June 24, 1938, age 61. Graduate of Cooper Medical College, San Francisco, 1899. Licensed in California in 1900. Doctor Hanlon was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

✝

Martin, John Perry. Died at Oakland, July 5, 1938, age 67. Graduate of the Eclectic Medical College, Los Angeles, 1903. Licensed in California in 1918. Doctor Martin was a member of the Alameda County Medical Association, the California Medical Association, and the American Medical Association.

✝

Merrill, Belle Ellingsen. Died at Coquille, Oregon, July 6, 1938, age 53. Graduate of the University of California Medical School, San Francisco, 1920, and licensed in California the same year. Doctor Merrill was a member of the Alameda County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✝

Swindt, Joseph Martin. Died at Olema, June 9, 1938, age 32. Graduate of Cornell University Medical College, Ithaca, 1932. Licensed in California in 1934. Doctor Swindt was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

✝

Widney, Joseph Pomeroy. Died at Los Angeles, July 4, 1938, age 97. Graduate of University of California Medical School, 1866. Licensed in California in 1876. Doctor Widney was an Honorary member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

OBITUARY

Joseph Pomeroy Widney*
1841–1938

Dr. Joseph Pomeroy Widney was born in 1841, on December the 26th, in Miami County, Ohio, and he passed from this life July 4, 1938, in his ninety-seventh year.

These two important episodes in the life of every man were interspersed with minor phases of life which were outstanding, so far as their relation to the medical profession of the State of California is concerned.

Doctor Widney received his degree of Doctor of Medicine from the Toland Medical College, now the Medical Department of the University of California, in 1866; he was then 25 years of age. His passing on the national birthday of his country brings so forcibly to mind his military service for his country. He took an active part in two campaigns against the Apaches in 1867 and 1868. The outstanding feature of these campaigns was the long rides on an uncharted desert.

There is no doubt but that some of the books that Doctor Widney wrote in the later years of his life regarding the progress of civilization found a deep-rooted basis in his study of these primitive people on the desert, because the way in which they lived, and the way in which he was forced to live in order to preserve life under these primitive conditions as retold in these works, made a deep impression.

Three years after he entered practice in Los Angeles, Doctor Widney exhibited a faculty which has been characteristic and outstanding throughout his life. That is, he established the custom of order in his social relations which was a forerunner of his ethics and contact among men. He was the leading spirit among the founders of the Los Angeles County Medical Association when that organization came into existence, January 31, 1871. In a clear Spencerian hand, which might be described as copperplate, the by-laws of the Los Angeles County Medical Associate were inscribed in a minute book and adopted. It is interesting to note that this association was founded as an association and not as a society, and that it continued as such until about November, 1885. At that time, by-laws were adopted in which the name appeared to be a society, and it continued as such until new by-laws were adopted in 1890. At that time the older term was again used by the Los Angeles County Medical Association. This is rather interesting to note as our national organization was the only medical organization at that time using the term "association"; and only in recent years have the state societies and other county medical societies adopted the term association in lieu of the term "society."

In 1878, Doctor Widney was one of the incorporators of the Los Angeles County Medical Association. This, we believe, was the first medical association to be incorporated in the United States. As a corporation the organization never functioned actively until 1920. Since that time the organization has been completely functioning as a corporation, and as the legal representative of the California Medical Association.

Doctor Widney's founding in Los Angeles County of the University of Southern California in 1880, and of its first medical school in 1885, were clearly in line with that ethical effort to bring order and progress out of chaos where organization was lacking before.

Doctor Widney never compromised with himself, he never accepted a substitute when there was something better to be had. Throughout his entire life he was an exemplary personality in what he considered to be best adapted to the civilization in which he lived. By his mental and physical efforts he kept the organizations in which he was identified financially solvent, and he kept himself in his ninety-seven years, absolutely independent of the aid of others and left a good dependency when he passed.

Two thoughts outstanding in the last articles that Doctor Widney wrote five days before his death are quite characteristic of the man: Life and death, "The purpose of that drama is—The making of a man: not simply for time, but for eternity." He states the pleasures of Heaven lie in the thought, "I, too, am a sharer in the development of the world that is about me, a sharer with God, therefore forever sharing in the mind of the Supreme Maker of Law."

These are thoughts from the long life of a man who was experienced in the ways of the world and many of its trials and tribulations. In his later years he devoted much of his time to the study of the Scriptures. He spent his life doing good deeds among his fellow-men. He passed into eternal life leaving behind an inspiring record for those who must follow after him.

HARLAN SHOEMAKER, M. D.
JOSEPH M. KING, M. D.
JOHN W. SHUMAN, M. D.

+

Winston C. Crabtree
1902–1938

Winston C. Crabtree died July 14, 1938, of subacute bacterial endocarditis. He had been ill for about four months.

Doctor Crabtree was a native of Kentucky, having moved, with his parents, to San Diego at an early age. After attending school in San Diego he carried on his undergraduate work at Pomona College. Later he studied medicine at the University of Michigan, graduating in 1928. Following an interneship, he did postgraduate work in otolaryngology at the University of Iowa.

Doctor Crabtree returned to San Diego in 1931 and began the practice of his chosen specialty. His fine character and outstanding ability quickly made for him an ever widening circle of friends and admirers, both among his professional colleagues and among the public. His death is an irreparable loss, not only to his family and friends, but also to the medical profession which he served so well.

* Other photographs of the late Dr. Joseph P. Widney appeared in CALIFORNIA AND WESTERN MEDICINE in the following issues: Vol. 44, No. 4, April, 1936, page 292; Vol. 44, No. 5, May 1936, page 396; Vol. 46, No. 6, June, 1937, page 398.

Editorial comment in this issue appears on page 106.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION †

MRS. CLIFFORD A. WRIGHT.....President
MRS. FRED H. ZUMWALT.....Chairman on Publicity
MRS. FRANK H. RODIN....Assistant Chairman on Publicity

Woman's Auxiliary to the American Medical Association: 1938 Annual Session

The eighty-ninth annual session of the American Medical Association held in San Francisco from June 13 to June 17, 1938, was a success, both scientifically and socially.

The members and guests of the Woman's Auxiliary came from almost every state in the Union and California received them with open arms. San Francisco and her sister county auxiliaries had planned and given their best efforts for the entertainment and comfort of our guests. The whole city seemed to be in a holiday spirit with banners and signs of "Welcome A. M. A. Convention." Even the weatherman was kind and favored us with pleasant weather and glorious sunshine.

We are grateful to Mrs. J. C. Geiger, general chairman of arrangements. We sincerely thank the committee chairmen and their many assistants for the fine program of entertainment. A special vote of thanks to Mrs. John Humber and her assistants for the exquisite floral arrangements which were in evidence everywhere. The decorations added much to the pleasure of our guests, as evidenced by the expressions of admiration and appreciation.

The registration of members and guests, with headquarters at the Fairmont Hotel, started Sunday, June 12, under the able chairmanship of Mrs. Harry O. Hund. The gracious smiles and willing assistance of the many women who assisted Mrs. Hund helped to make our guests feel at home.

The National Board met on Monday morning, after which all gathered at an informal luncheon, convening again at 2 p. m.

In the afternoon there was a choice of sightseeing trips for members and guests. Many took advantage of the trip over the San Francisco-Oakland Bay Bridge to the University of California. They were there the guests of Alameda County Auxiliary for tea at the International House. Gracious hostesses made the afternoon very enjoyable.

Others took a tour of the City of San Francisco, visiting Golden Gate Park, the Japanese Tea Garden, Fleishhacker Pool and Zoo, driving along the shores of the Pacific Ocean, through the Presidio, over the Marina Boulevard to Fisherman's Wharf, ending with a trip through our famous Chinatown. Those who did not care to go on sightseeing trips, played golf, tennis, rode horseback over our beautiful bridal paths or went swimming.

A Chinese dinner planned for the evening, was well attended. Those who dined in Chinatown will tell you that they never had more fun. Have you ever eaten the native Chinese food? It is as good as it is unusual. After dinner the group visited the Chinese Theatre, its dramas and comedies presented in the manner as that of their ancestors of centuries ago. The Joss Houses were very interesting, as was the telephone exchange. The Chinese girl operators must memorize some twenty-five hundred numbers in order to give satisfactory service.

On Tuesday we started very early. Several hundred women attended the Southern breakfast honoring Mrs. Augustus S. Keck. Early morning is so delightful in San Francisco and everyone seemed in very good spirits. If we did give up some of our beauty sleep to get to this breakfast on time, we were well repaid by the inspiring talks by Doctors J. H. J. Upham, Irvin Abell and A. T. McCormick, and the brilliant and witty response by Mrs. Keck.

The tables looked so pretty with their novel decorations of fruit and flowers. The speakers' table was exceptionally beautiful. It whetted our appetites. Seats were not reserved, so we sat where we pleased. What an experience! To be able to talk to women from five different states seated around one breakfast table. After breakfast everyone dashed off to the formal opening of the general meeting of the Woman's Auxiliary to the American Medical Association.

At noon more than a thousand women gathered for a boat trip and luncheon to be served on Treasure Island, where one got a preview of the 1939 World's Fair. A hill-billy orchestra entertained during luncheon. The excursion took the guests around the beautiful San Francisco Bay, viewing our magnificent bridges, Alcatraz Island, up the Estuary in Oakland and to many other places of interest.

The general session of the American Medical Association convened in the evening in the Memorial Opera House. Hon. Angelo Rossi, mayor of San Francisco, welcomed the august body of the American Medical Association. Musical selections, rendered during interludes, made the meeting enjoyable and interesting.

The Aloha luncheon, honoring Mrs. Charles C. Tomlinson of Omaha, Nebraska, took place on Wednesday. Mrs. Augustus S. Keck presided, and introduced Mrs. Tomlinson, the new president of the Woman's Auxiliary to the American Medical Association.

Again the table decorations were most beautiful. The speakers' table was a riot of delicate shades of the exquisite tuberous begonia and foliage. These were particularly interesting to the women from distant states, where these blossoms do not grow.

Doctors Walter Donaldson and Irvin Abell were the guest speakers. They stressed the importance of the woman's auxiliaries to the medical associations and the need for every doctor's wife to be armed with knowledge to help guard the high standards of scientific medicine and to help combat subversive legislation and quackery. The women were becoming more and more useful as an adjunct to the medical societies in the communities where they are organized, we were told.

The closing ceremony was most beautiful and awe-inspiring. An old Polynesian Lei ceremony was adapted for this purpose, through the courtesy of Mrs. A. T. Newcomb of Pasadena. To the soft music of an Hawaiian orchestra, Mrs. William Henry Sargent of Oakland recited the commentary to this Polynesian rite.

Thus ended the meeting of the Woman's Auxiliary to the American Medical Association for 1938.

* * *

The home of the San Francisco County Medical Society is housed in one of San Francisco's old residences, which adapted itself so conveniently for the lovely reception held Wednesday evening for Auxiliary members and doctors' wives.

Over four hundred women gathered to enjoy the evening, which offered music, a fashion show and refreshments.

This was a background for the harp selections rendered by the talented Miss Ann Everingham, daughter of an Alameda Auxiliary member. Attractive manikins displayed beautiful summer costumes through the courtesy of I. Magnin & Company. Miss Helen Zumwalt, gifted daughter of a San Francisco member, sang Viennese songs, dressed in picturesque Viennese costume. A bridal party, gorgeously gowned, completed the fashion show. Eva Grunenger Gibson, our own dear president of the San Francisco County Auxiliary, closed a perfect evening with vocal selections. Miss Gladys Steele accompanied Mrs. Gibson and Miss Zumwalt.

Santa Clara and San Mateo County auxiliaries were hostesses on Thursday for lunch at the Allied Arts in Palo Alto.

The guests started on the motor trip from San Francisco at 11 o'clock, traveling by way of the Skyline Boulevard, visiting Stanford University and reaching the Allied Arts for lunch. They returned over the Bay Shore Highway.

After lunch another scenic tour was taken over the Golden Gate Bridge into Marin County, visiting Muir Woods and Mt. Tamalpais.

†As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Frank H. Rodin, Assistant Chairman of the Publicity and Publications Committee, 2457 Bay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Rodin and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

One of the most interesting features of the Auxiliary convention were the exhibits presenting outstanding work and interesting activities sent in by auxiliaries from nearly every state in the Union. We may, indeed, be proud of such an active program as these exhibits presented. They were all so fine, one could not choose; each seemed to vie with the other for importance. In this room a musical program was given on Thursday afternoon. Mrs. Ily R. Beir of Atlantic City, New Jersey, is to be congratulated on the fine work she has done as national chairman of this department.

The closing events of the convention were the "Bring your husband" dinner held at the Fairmont Hotel and the President's reception and ball that followed at the Palace Hotel.

Mrs. Otis Floyd Lampson of Seattle, Washington, was the hostess at the dinner and Mrs. Harold G. Trimble of Oakland was chairman of arrangements.

On entering the dining room one's breath was taken away by the picturesque arrangement of the decorations. Mrs. John Humber and her committee seemed to have performed a miracle with the arrangement of the flowers. Tables were set for parties of eight and ten. The flowers were white, artistically set in shining copper bowls. The speaker's table was beautifully decorated with delicate white calla lilies in gleaming high brass containers and large candelabra with many white candles.

The Doctors and Dentists' Orchestra of Alameda County furnished the music during dinner.

Unknown to the committee on decorations, Dr. and Mrs. Charles C. Tomlinson were celebrating the twenty-ninth anniversary of their wedding, so the bridal appearance of the dining room fitted perfectly into the scheme of events. Mrs. Trimble, after being introduced by Mrs. Lampson, extended congratulations and best wishes, and presented the happy couple with an old-fashioned bouquet of gardenias.

In closing, Mrs. Trimble drew a beautiful word picture of the romantic parting when one leaves the Hawaiian Islands, saying: "Aloha, until you and I meet again next year."

The President's reception and ball also had its very pretty settings, and everyone enjoyed the gracious hospitality, music and dancing.

* * *

A few words about the convention meetings of the National Auxiliary.

The first general session of the Auxiliary was held on Tuesday morning at the Fairmont Hotel. Mrs. Augustus S. Keck presided in her dignified and charming manner. Mrs. J. C. Geiger, general chairman, was introduced and made the necessary announcements. The invocation was given by Rev. George H. B. Wright, Cannon, Grace Cathedral.

The address of welcome was given by our own State President, Mrs. Clifford A. Wright of Los Angeles, as follows:

Welcome, members and friends of the Woman's Auxiliary to the American Medical Association! California Auxiliary members extend greetings and offer the hospitality of the West—a hospitality which knows no bounds.

To reach this most western city on the shores of the great Pacific, you have crossed deserts, mountains and water. Some have come by automobile or boat, others by train, and there were those who took that still almost unbelievable mode of rapid transportation, the airplane. We hope you enjoy your visit and that the benefits and pleasure you receive will compensate you for the distances you have traveled and for the inconveniences that may have been yours.

Romantic, historic old San Francisco is teeming with the traditions of an early settlement on the shores of one of the world's most marvelous natural harbors. The Gold Rush days of California and the spending of the wealth of Nevada silver added much to the development of this part of the country. May you partake of the old and the new that surround you in this, your hostess city.

The East is East; the West is West; the two have met on common ground. Renewing old friendships, forming new ones; loyal to our husbands and to the medical profession to which they pledged their lives. The medical men are the life guards of the world.

You have returned to the place of your birth, triumphant. California is proud of you, your growth and accomplishments. Again may I say welcome. May you find in the West the glorious Golden West, the share of joy and happiness that we know is here for you.

The response was given by Mrs. Rollo K. Packard of Illinois, as follows:

It is a pleasure to respond on behalf of the Woman's Auxiliary to the American Medical Association to the welcome just extended, and to express our appreciation for the splendid work of the various committees.

It seems quite fortunate both for the old and the new members here in attendance that, in these more or less troubled times for all mankind, we are privileged to come here to the scenic, colorful and natural beauty of California and enjoy the hospitality of this great city and its great people.

It has been my good fortune to have visited this great state several times and to have motored over the highways and byways of a considerable part of it. I shall not attempt to describe it, although more gifted have tried. Really, the Californians cannot describe it.

I only hope that you will find time to linger on a few days or weeks and enjoy the varied interests that await you.

You must know California's history, its struggles and its determinations. You must see it by sunrise, by sunset and by moonlight, and then you will want to see it all over again, and finally you will want to come here to live."

The "In Memoriam" was very beautifully and spiritually given by Mrs. Daniel J. Swan of Flushing, New York. Mr. Frank Houser played soft melodies on his violin during the roll call.

The chairmen of convention committees reported: Mrs. Harry O. Hund, credentials and registrations; Mrs. Charles Rayburn, convention rules; Mrs. Hobart Rogers, resolutions.

The president, Mrs. Keck, read her message.

The reports of the corresponding secretary, recording secretary, treasurer, auditor and standing committees followed.

Mrs. Charles C. Tomlinson, president-elect, of Omaha, Nebraska, was introduced by Mrs. Keck.

After further announcements the meeting was adjourned to convene again the following morning.

Wednesday morning: Mrs. Keck presided. The minutes were read and the following reports were made: Mrs. J. C. Geiger, convention committees; Mrs. Harry O. Hund, credentials and registrations; Mrs. Hobart Rogers, resolutions.

The state presidents read some very glowing reports of the activities of their auxiliaries which were very interesting and inspiring.

The nominating committee presented the names proposed for election. There being no nominations from the floor, the officers were elected as presented by the nominating committee.

In the absence of Mrs. Arthur B. McGlothlan, Mrs. James F. Percy of Los Angeles installed the newly elected officers with a very inspiring ceremony.

After the reading of the courtesy resolutions, and the minutes, the official meeting of the Woman's Auxiliary to the American Medical Association came to an end and was adjourned.

The following very interesting and informative conferences were held on Wednesday afternoon under the leadership of the various chairmen as follows: Public relations and health education, Mrs. A. Haines Lippincott; program, Mrs. V. E. Holcombe; Hygeia, Mrs. James Lester.

MRS. FRANK H. RODIN.

Re: Washington, D. C., Press Dispatches.—"The proposition to socialize the medical profession is in line with a number of other things designed to come under government control in these later days. When people are regimented to summon medical care through government-politico dictation they won't care to get well, for next thing the government will attempt to administer the last sacrament and conduct the funeral."—*Reseda News.*

"From his experiments in human learning Thorndike has concluded—'Learning without interest of some sort does not occur in any appreciable degree.' Therefore it is most ineffective to bombard the population with health facts or urge them to improve their practices if they have no interest in the facts or in changing their habits."—*The Health Officer.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, St. Louis, Missouri (date to be announced later). Olin West, M.D., Secretary, 535 North Dearborn Street, Chicago, Illinois.

California Medical Association, Hotel Del Monte, May 1 to 4, 1939. George H. Kress, M.D., Secretary, 450 Sutter Street, San Francisco.

Medical Broadcasts*

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of August is as follows:

Thursday, August 4—KECA, 11:00 a. m., The Road to Health.
Saturday, August 6—KFI, 9:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, August 11—KECA, 11:00 a. m., The Road to Health.
Saturday, August 13—KFI 9:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, August 18—KECA, 11:00 a. m., The Road to Health.
Saturday, August 20—KFI, 9:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, August 25—KECA, 11:00 a. m., The Road to Health.
Saturday, August 27—KFI, 9:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.

1938 Rural Health Conservation Contest Announced. The Chamber of Commerce of the United States and the American Public Health Association have announced the 1938 Rural Health Conservation Contest, the fifth of a series of competitions designed to further the development of sound rural public health work, and to stimulate needed improvement in community health services.

Any district or county health unit providing whole-time health services is eligible to participate in the contest. Whole-time health departments of California have, during past years, enrolled in these contests, and some of them have succeeded in winning awards. It is hoped that a large number of California counties will enter into the 1938 contest.

Some of the advantages to local health units that may take part are stated as follows:

1. It provides a means (the public health committee) of bringing about a substantial, sustained and intelligent lay interest in public health.

2. It promotes the keeping of adequate comparable records which can be used in measuring progress.

3. Through the inclusion of all agencies, groups and individuals engaged in the public health work the contest:

(a) Presents a clearer and more complete picture of the community-wide public health program than was, perhaps, heretofore available.

(b) Tends to develop a community-wide esprit de corps and public health consciousness.

(c) Encourages the more effective use and integration of all the community's facilities for public health betterment.

(d) Through giving definite credit for work done by private practitioners of medicine and dentistry encourages the increasing practice of preventive measures by these two all-important groups.

*County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

Western Division of the American Society for the Control of Venereal Diseases Organized.—Following some months of consideration, the American Society for Control of Venereal Diseases, organized last year, has merged with the American Social Hygiene Association. Activities will be promoted in the Pacific Coast and Mountain States through a *Western Division Office* under the direction of a western advisory committee including Dr. Russell V. Lee, President Ray Lyman Wilbur, Dr. William P. Shepard, Dr. Thomas A. Storey, and Ray Smith. W. F. Higby, who has long been interested and active in social hygiene work, and is an experienced administrator, will be responsible for executive direction. Alan Blanchard, a recent recruit to social hygiene, will work at the educational and public information program. Mrs. Marion Simonson, American Social Hygiene Association field representative, who has been on the West Coast since March, will remain until the end of June to work with the new staff, look after exhibits and confer with delegates at meetings of the American Medical Association, the Western Division of the American Public Health Association, the United States Junior Chamber of Commerce, and the National Conference of Social Work.

Western friends and members we know will welcome this new plan and we hope will make full use of the facilities available. Address of the new office is 45 Second Street, San Francisco, California.

American Public Health Association.—The preliminary program of the scientific sessions of the sixty-seventh annual meeting will be held in Kansas City, Mo., October 25 to 28, with more than 3,000 professional public health workers in attendance.

The program comprises fifty morning and afternoon meetings arranged by the ten sections of the Association, which are: Health Officers, Laboratory, Vital Statistics, Public Health Engineering, Industrial Hygiene, Food and Nutrition, Child Hygiene, Public Health Education, Public Health Nursing, Epidemiology.

Special sessions are planned on Public Health Aspects of Medical Care, Oral Hygiene, Professional Education and Diphtheria Immunization. A public meeting under the auspices of the local committee is scheduled for Wednesday evening, October 26, with Dr. E. V. McCollum discussing Milk Pasteurization and Dr. Arthur T. McCormack on New Responsibilities of the Health Officer.

There will be symposia on industrial hygiene administration, venereal disease control, laboratory diagnostic methods, expanding responsibilities in public health engineering, maternal and child health, frozen desserts, industrial hazards, water and sewage, typhoid fever, the next steps in school health services, milk and dairy products and many other important subjects.

A few of the well known names on the program are as follows: Colonel A. Parker Hitchens, Dr. Earle G. Brown, Dr. Haven Emerson, Surgeon-General Thomas Parran, Joel I. Connolly, Dr. Nina Simmonds, Dr. Karl F. Meyer, Dr. Walter Clarke, Professor C.-E. A. Winslow, Dr. George C. Ruhland, Dr. William A. Sawyer, Dr. Walter H. Eddy, Dr. Frank G. Boudreau, Sol Pincus, Dr. Martha M. Eliot, Dr. Abel Wolman, Dr. Robert S. Breed and Dr. Felix J. Underwood.

More than 300 papers and committee reports will be presented during the four-day meeting. They will cover the what, how and why of modern public health practice in the United States.

The preliminary program is printed in full in the August issue of the *American Journal of Public Health*, published by the American Public Health Association at 50 West Fiftieth Street, New York, N. Y.

Postgraduate Medical Courses for Practicing Physicians: Stanford University School of Medicine.—Stanford University School of Medicine, in coöperation with the San Francisco Department of Public Health and the San Francisco Hospital, announces a series of postgraduate courses to be given September 12-16, 1938, inclusive. The registration fee is $25. Additional fees of $10 will be made to cover the cost of materials used in Course 8, Surgical Anatomy and Operative Technique, and in Course 10, Otorhinolaryngology. Each physician may take a morning and an afternoon course and all physicians should attend the evening general meetings. Registration closes September 6, 1938. Applications for registration in these courses should be mailed to the Dean, Stanford University School of Medicine, 2398 Sacramento Street, San Francisco, not later than September 6. Outlines of the courses follow:

MORNING COURSES

Monday, Tuesday, Wednesday, Thursday and Friday, 8:30–12:00

Course 1—Traumatic Injuries, Acute Abdominal Emergencies and Fractures (At San Francisco Hospital)

This course will deal with the handling of abdominal and other emergencies, traumatic injuries, and the diagnosis and treatment of fractures.

Course by Doctors J. W. Cline, Delbert Hand, Nelson Howard, Donald King, Carleton Mathewson, J. M. Meherin, E. J. Morrissey, W. L. Rogers and E. B. Towne.

Course 2—Gynecology

This course will deal exclusively with gynecologic problems. Medical gynecology will be stressed. This will include the treatment of cervicitis, trichomonas infection, sterility, urinary infections, preparation and use of pessaries. Some time will be devoted to the discussion of surgical indications and surgical methods. Endocrine problems dealing with menstrual disorders will be included if desired by the majority of applicants.

Course by Doctors L. A. Emge, C. F. Fluhmann, A. V. Pettit, K. L. Schaupp, H. A. Stephenson and Hans von Geldern

Course 3—Ward Rounds in Medicine (Two sections limited to fifteen physicians in each section)

This course will consist of rounds in the medical wards, with conferences and demonstration of patients presenting problems in internal medicine, to be followed by discussions of the specific diagnostic procedures and therapy. Clinico-pathological conferences will be a part of this course.

Section at Lane Hospital by Doctors C. W. Barnett, A. L. Bloomfield, Garnet Cheney, William Dock, E. F. Holman, G. S. Johnson, J. K. Lewis, G. S. Mirick, R. R. Newell, W. H. Northway and D. A. Rytand.

Section at San Francisco Hospital by Doctors George D. Barnett, D. K. Burnham, A. J. Cox, L. H. Garland, H. P. Hill, Lovell Langstroth, Carleton Mathewson, Carol McKenney, J. M. Read, Robert Shelton, C. F. Sweigert, Edgar Wayburn, D. L. Wilbur and J. M. Wolfsohn.

Course 4—Diseases of the Chest

This course will review diseases of the chest by demonstrations and clinics, including history, physical examination, differential diagnosis and treatment, together with an x-ray, pathological, and medical-surgical symposia. The problem of tuberculosis as it involves the general practitioner will be stressed.

Course by Doctors W. G. Burkhard, Leo Eloesser, E. F. Holman, R. R. Newell, P. H. Pierson, Martin Seid and D. A. Wood.

AFTERNOON COURSES

Monday, Tuesday, Wednesday, Thursday and Friday, 1:30–5:00

Course 5—The Practical Management of Hypertension and Nephritis in the Doctor's Office

Information derived from ambulatory patients, in conjunction with the results of new laboratory methods designed for use in the doctor's office, will be used for the discussion of diagnosis and as a basis for the planning of treatment.

Course by Doctors Thomas Addis and D. A. Rytand.

Course 6—Pediatrics

This course will review four general groups of pediatric problems: (1) the care of normal infants and children, including infant feeding; (2) the prevention of disease, including deficiency diseases and methods of immunization; (3) the commoner disorders and diseases of childhood, including the communicable diseases; (4) disturbances of mind and behavior, and methods of child guidance. Surgical problems will also be discussed.

Course by Doctors L. R. Chandler, L. B. Dickey, H. K. Faber, D. C. Marshall, J. J. Miller, J. C. Parott, M. I. Preston, A. P. Purdy and R. P. Seitz.

Course 7—Proctology

This course will review the common lesions of the large bowel, rectum and anal canal, including technique of examination, methods of office treatment, operative indications and technique, pathology, differential diagnosis, etc.

Course by Dr. Robert Scarborough.

Course 8—Surgical Anatomy and Operative Technique (Limited to twenty-four physicians)

This course will be conducted in the dissecting room and the experimental laboratories; will include dissection of special regions and instruction and practice in the technique of various operations.

An additional fee of $10 will be made to cover the cost of material used in this course.

Course by Doctors Donald King and G. W. Nagel.

COURSES FOR SPECIALISTS

Monday, Tuesday, Wednesday, Thursday and Friday Mornings, 9:00–12:00; Afternoons, 2:00–5:00

Course 9—Anesthesiology (Limited to six physicians. Only those whose practice already includes anesthesiology will be eligible to this course)

This course will review preliminary medication; the newer anesthetic agents; the rectal, intravenous, and inhalation methods of administration; spinal anesthesia.

Course by Doctors Emelie Andersen, E. H. Case, Adena Dutton, W. Golenternek, W. B. Neff, L. A. Rethwilm, J. A. Stiles and L. Wright.

Course 10—Otorhinolaryngology (For specialists only; general practitioners are not eligible for this course)

This course will cover anatomy, physiology, pathology; practical operative work on cadavers; treatment of diseases of the ear, nose, and throat.

An additional fee of $10 will be charged to cover the cost of anatomical materials used in this course.

Course by Doctors R. E. Ashley, J. A. Bacher, C. B. Cowan, S. v. Christierson, F. D. Fellows, W. M. Fitzhugh, H. A. Fletcher, H. B. Graham, H. Y. McNaught, R. C. McNaught, P. J. Moses, A. G. Rawlins and E. C. Sewall.

GENERAL MEETINGS

Tuesday, Wednesday and Thursday Evenings, Lane Hall, 8:00–10:00 o'clock

Meeting 1. Tuesday evening, 8:00–10:00 o'clock

Surgical Pathology; Clinico-pathological Conferences

Dr. D. A. Wood

Meeting 2. Wednesday evening, 8:00–10:00 o'clock

Relation of Sex Hormones to Cancer

Dr. L. A. Emge

Disease of the Thyroid Gland

Doctors E. F. Holman and D. L. Wilbur

Meeting 3. Thursday evening, 8:00–10:00 o'clock

Diagnosis and Modern Treatment of Common Dermatoses

Doctors H. E. Alderson and M. T.-R. Maynard

Doctor Reed to Speak on World Health at Amsterdam.—A sort of diagnosis of the present health status of the world at large is to be presented to the Third International Congress of Tropical Medicine and Malaria in Amsterdam on September 25, by Dr. Alfred C. Reed, president-elect of the American Society of Tropical Medicine and member of the faculty of the Hooper Foundation for Medical Research in the University of California.

The effect of wars, widespread soil erosion, shifting economic conditions, natural disasters, transportation breakdown, epidemics and related conditions on the health of the human race is being outlined in Doctor Reed's Amsterdam paper.

Previous to attending the Congress at Amsterdam, Doctor Reed will visit the London School of Tropical Medicine and various other centers of the same type on the Continent. Doctor Reed's investigations into world health conditions will take him to Beirut, Damascus, Jerusalem, Cairo, Rhodes, Athens, Italy, France, Stockholm and Copenhagen.

Doctor Reed will return by way of Oklahoma City for the meeting of the American Society of Tropical Medicine, November 14-17. Doctor Reed will assume the presidency of the Society at this meeting.

U. C. Extension Course on Foods.—Miss Nina Simmonds, Ph. D., lecturer in medicine, and research associate in dentistry, University of California, will conduct a University Extension course in foods and nutrition this fall, according to a recent announcement. The course has been planned for dentists, dental hygienists, physicians, public health nurses, social case workers, and others interested in modern developments of nutrition. The tentative date for the opening of the course is Wednesday, September 21, at 8 p. m., 540 Powell Street, San Francisco.

California Hospital, Los Angeles, Holds Annual Jinks.—The announcement of the annual outing meeting of the attending staff of the California Hospital of Los Angeles, an institution founded in the nineties by the late Dr. Walter Lindley and other leaders in the old College of Medicine of the University of Southern California, gave the following interesting information:

Time—July 23, from 2:00 p. m. until——
Place—Uplifter's Ranch, Santa Monica.
Purpose—Good, wholesome, frolicking fun.
Competitive Sports—Baseball, sprinting events, horseshoe pitching, African golf, bridge, special internes' race—many other novel stunts and contests as usual.
Dinner—Delicious barbecued steaks and fixings.
Floor Show—Guarantee no copyright infringement, new talent (completely disguised), new everything.
Post mortem session at the club house.

American Congress of Physical Therapy.—The seventeenth annual scientific and clinical session of the American Congress of Physical Therapy will be held coöperatively with the twenty-second annual convention of the American Occupational Therapy Association, September 12, 13, 14 and 15, 1938, at the Palmer House, Chicago. Preceding these sessions, the Congress will conduct an intensive instruction seminar in physical therapy for physicians and technicians—September 7, 8, 9 and 10.

The convention proper will have numerous special program features, a variety of papers and addresses, clinical conferences, round table talks, and extensive scientific and technical exhibits.

The instruction seminar should prove of unusual interest to everyone interested in the fundamentals and in the newer advances in physical therapy. The faculty will be comprised of experienced teachers and clinicians; every subject in the physical therapy field will be covered. Information concerning the convention and the instruction seminar may be obtained by addressing the American Congress of Physical Therapy, 30 North Michigan Avenue, Chicago.

American College of Surgeons.—A clinical congress of the American College of Surgeons, founded by surgeons of the United States and Canada in 1913, will be held during the twenty-eighth annual session, New York, October 17-21, 1938.

The surgeons of that great medical center, under the leadership of representative committees, are preparing a five-day clinical program that will provide a complete showing of their clinical activities in all departments of surgery. An outline of the clinical program is published in the June Bulletin of the College and the July number of "Surgery, Gynecology and Obstetrics." It will be noted that the clinical schedules are arranged by specialties, and so correlated that the visiting surgeon may plan to devote his time continuously to those special subjects in which he is most interested.

A symposium on "Graduate Training for Surgery and the Surgical Specialties" will feature the opening session of the Congress on Monday morning. At the presidential meeting and convocation, on Monday evening, the retiring president, Dr. Frederic A. Besley, will deliver the presidential address. This will be followed by the inauguration of the new officers and the conferring of fellowships upon the 1938 class of initiates. On succeeding evenings scientific papers on topics of timely importance will be presented by American and Canadian surgeons and distinguished visitors from abroad.

Outstanding features of the Congress program are: Conferences and symposia on fractures, cancer, obstetrics and gynecology, genito-urinary surgery, and traumatic surgery. Midday round-table conferences will provide a forum for the open discussion of many important surgical subjects.

American Association for the Study of Goiter.—The annual meeting of the American Association for the Study of Goiter for this year will be held in Washington, D. C., September 12, 13 and 14 in conjunction with the Third International Goiter Conference. A final program will be available at the time of the meeting and will be distributed to all attending physicians at the registration desk on the morning of September 12. For information, write to W. Blair Mosser, M.D., Corresponding Secretary, Kane, Pa.

The American College of Physicians.—The twenty-third annual session of the American College of Physicians will be held in New Orleans, with general headquarters at the Municipal Auditorium, March 27-31, 1939. Dr. William J. Kerr of San Francisco is president of the college, and will have charge of the program of general scientific sessions. Dr. John H. Musser of New Orleans has been appointed general chairman of the session, and will be in charge of the program of clinics and demonstrations in the hospitals and medical schools, and of the programs of round table discussions to be conducted at the headquarters.

Excerpt from a Letter Received from an Attorney Friend, After Perusal of Legal Counsel Peart's Opinion.*— . . . "From such knowledge as I have of the (Los Angeles County Hospital) situation, however, I cannot help feeling that Mr. Peart's opinion is correct. I might add, not as a matter of law but as a matter of personal opinion, that any law that permits a state, county, or city to hound anybody and everybody who has ever had to seek public relief, either for "support" or for hospital service, if that once unfortunate person is ever able to acquire property or earn a livelihood not exempt from attachment or garnishment, is a brutal law. Certainly a law of that kind, if needed at all, should be limited so as to permit the state, county, or city to recoup only from those who subsequently acquire wealth or earnings sufficient to justify that procedure."

Big Health Museum May Spring from 1939 Exposition.—A permanent public health museum, perhaps the first in the United States, which would reveal many of the present secrets of plague suppression, and the campaigns against such epidemics as typhoid, tuberculosis and diphtheria, will be one of the principal developments of the Golden Gate International Exposition, if plans now being drawn up by the American Public Health Association finally materialize. It is hoped to locate the museum somewhere in the San Francisco Bay region, possibly in San Francisco. It will be so set up that displays of specimens and procedures may be sent to any point in the West and to the three Canadian provinces claiming membership in the Association.

Preliminary plans for the museum were discussed at the tenth annual meeting of the Association in Portland, June 6 to 8, on which occasion more than 500 public health officers from all parts of the country and from the provinces of British Columbia, Saskatchewan and Alberta, discussed the health needs of the individuals and communities under their jurisdiction. The plans that public health groups are making to exhibit at the big San Francisco Exposition were compared and detailed, and the unanimous opinion was reached that this fine array should be consolidated into a single museum when the Exposition is over. Committees were appointed to draw up a plan. It is understood that eastern interests are considering a like museum to house the public health displays at the New York world's fair.

The western branch of the Association is presided over by Dean Guy F. Millberry of the University of California College of Dentistry here. This branch includes the eleven western states, the three Canadian provinces mentioned, and Alaska, and has jurisdiction over the public health activities of 16,000,000 people. At the Portland meeting, a paper by Dr. Karl F. Meyer, director of the Hooper Foundation of Medical Research of the University, described the ravages of sylvatic plague now sweeping through the rodent populations of the West. The Association plans to hold its 1939 meeting in or near San Francisco.

* Opinion of Mr. Peart appears on page 157.

Solano and Sonoma Organize Full-Time Units.—The boards of supervisors of both Solano and Sonoma counties have organized their county health departments into full-time units, effective July 1, 1938. Both units will include all unincorporated territory within their respective boundaries.

Dr. A. Frank Brewer of Berkeley has been appointed health officer of Solano County. Two public health nurses, a sanitary inspector, and a clerk, all employed full time, will comprise the staff. The organization of the Sonoma County unit is in process of completion.

With these two new units, there are now twenty-four counties of California, the health departments of which are conducted by employees who devote their whole time to the duties of their respective offices. These counties are: Alameda, Contra Costa, Fresno, Imperial, Kern, Los Angeles, Madera, Monterey, Orange, Riverside, San Bernardino, San Diego, San Francisco, San Joaquin, San Luis Obispo, San Mateo, Santa Barbara, Santa Cruz, Solano, Sonoma, Stanislaus, Tulare, Ventura, Yolo.

Venereal Disease Prevention: Federal Appropriations.—Venereal diseases were given fresh recognition as a national problem when both Houses of Congress recently passed the La Follette-Bulwinkle bill authorizing federal aid to the states for the prevention and control of these diseases. With President Roosevelt's signature on May 25, this bill became a law authorizing appropriations to be made for each of the fiscal years 1939, 1940 and 1941 of three, five and seven million dollars, respectively, and such amounts annually thereafter as may be necessary. The next step necessary was appropriation by Congress of the first $3,000,000 for the year beginning July 1, 1938. This appropriation was finally included in the second deficiency bill and went to the Conference Committee of the House and Senate June 15, was reported favorably, voted, and sent to the President June 16. Grants will be made to the states, territories and insular possessions on the basis of population, prevalence of venereal diseases and need for federal assistance. State health officers and the U. S. Public Health Service will jointly decide upon what projects the grants will be spent.

A nation-wide survey conducted last month by the American Institute of Public Opinion showed the consensus overwhelmingly in favor of such a program of federal aid. Throughout the country 86 per cent of those questioned said "Yes" to the query: "Do you think Congress should appropriate money to aid states in fighting venereal disease?"

Pacific Coast Survey of Safety Laws and Orders.—Safety laws and orders of eleven western states are the subject of a survey to be made by a new WPA project at a cost of $10,000. This project, just approved by the Federal Government at Washington, will be directed by C. H. Fry, chief of the Industrial Accident Commission of California, and interim chairman of the Western Safety Conference to be held in Los Angeles, September 12-16.

Under the provisions of the project, twenty-seven experienced safety engineers and attorneys will unite in recodifying all safety laws and orders for the prevention of accidents in traffic, the home and in industrial vocations.

Aiding in the movement are the states of California, Oregon, Washington, Idaho, Montana, Wyoming, Colorado, Utah, Nevada, Arizona and New Mexico, which are subjects of the survey, as well as British Columbia, Alaska, Hawaii and Lower California.

Uniform safety laws have long been the dream of safety engineers and others interested in a lowering of the terrific loss of life from all public and industrial causes. Plans have been made for a series of conferences at the Western Safety Conference which are expected to have a far-reaching effect.

It is expected that the conclusions reached by the several thousand safety experts attending the conference will be of great value in the deliberations of the experts making the survey, many of whom will take part in the conference.

Industrial accidents will receive special consideration, as will traffic hazards caused by the difference in the traffic laws of the several states. This phase of accident prevention is of special importance to states visited annually by thousands of tourists.

International Medical Postgraduate Courses in Berlin.—In the autumn of 1938, international medical postgraduate courses are prospected.

For programs and further information apply to the Geschäftsstelle der Berliner Akademie für ärztliche Fortbildung, Berlin NW 7, Robert Koch-Platz 7 (Kaiserin Friedrich-Haus).

Foreign doctors and German doctors resident abroad are granted a reduction of fare of 60 per cent on the German Railways Company's lines; a foreign doctor can reduce the cost of his stay considerably by utilizing what are called "registered marks"; it is advisable to arrange matters with the local bank before starting.

Five High Awards Won by University of California at Big Medical Meeting.—Five of the twenty-four special awards for exhibits at the annual convention of the American Medical Association, held recently in San Francisco, went to the University of California Medical Center. This is considered particularly significant in view of the fact that many exhibitors were entered from all parts of the country. The value of the exhibits, biological, pathological and mechanical, was in excess of $1,000,000.

One of the most outstanding awards, the silver medal for exhibits showing the result of individual investigations, went to Hermann Sommer of the Hooper Foundation for Medical Research, a part of the University's medical center. Sommer had a particularly fine exhibit illustrating plankton and paralytic shellfish poisoning.

In the same category, Dr. John A. Marshall of the College of Dentistry received an honorable mention for an exhibit on clinical dental pathology.

The bronze medal for exhibits judged on the basis of excellence of presentation went to Dr. R. J. Reitzel and Dr. S. P. Lucia of the Division of Medicine, and Dr. Karl F. Meyer, director of the Hooper Foundation, for an exhibit illustrating clinical and epidemiologic demonstration of various infectious diseases.

Rudolph Skarda, research assistant in the Division of Anatomy, was given a certificate of merit for an exhibit illustrating anatomicrosurgical preparations.

Honorable mention was given Dr. LeRoy C. Abbott, Dr. F. C. Bost and Dr. John B. Saunders for their exhibit showing development of a technique for leg lengthening and reducing and otherwise treating fractures of the hip.

New Values Found for Health Factor in Oranges, Etc.—A significant new meaning has been given to the output of the orange grove, the truck garden and every other source of the potent vitamin C, through investigations into rheumatic fever made by the division of pathology of the University of California Medical School. These experiments have gone far to determine that vitamin C deficiency may be a contributory factor in the causation of rheumatic fever. At least two ounces of orange juice a day for both adults and children, or an adequate consumption of cabbages, tomatoes and other truck garden products rich in this vitamin, are suggested as a direct aid to the prevention of this disease, now considered a public health problem of major importance.

The studies of the division were made particularly with children and added new strength to the theory that the disease finds lodgment in the systems of undernourished children particularly. Many studies reveal the dominant occurrence of rheumatic fever among the poor. It is in the main a disease of childhood, the maximum incidence occurring between the ages of 5 and 12 years. It appears to be particularly prevalent in temperate countries and in the United States. The highest incidence of the disease is in the late winter and spring.

The comparative rarity of rheumatic fever and rheumatoid arthritis in Holland has been indicated by at least one outstanding authority and the importance of truck gardening and dairying in that country suggests that the local dietary might be more than adequate in vitamin C containing foods.

Studies made of the blood of children with rheumatic fever seems consistent with the idea of an absence of adequate amounts of vitamin C, according to Dr. James F. Rinehart, associate professor of pathology, who conducted the study for the Medical School.

New York Polyclinic Medical School and Hospital.—A special department of Facial Palsy has been established at the New York Polyclinic Medical School and Hospital for teaching purposes, with clinics every Thursday at 2 o'clock. This department is in charge of Dr. Thomas G. Tickle and his staff.

Hospital Gives Flowers Along with Medicine.—The University of California Medical Center has just prescribed a bouquet of flowers once a week to every patient in both hospital and public clinics.

Impressed by the peace of mind, the atmosphere of beauty and the general comfort that flowers bring to the sick, the staff of the Center has entered heartily into the activity of its volunteer unit in supplying fresh seasonal blooms for every tray. So far as is known, this is the only hospital in the country that has made the regular distribution of flowers a part of its routine.

So quickly has the idea "caught on" and so much benefit has resulted thus far, that the unit is now planning a "wild flower day," on which every patient will be given a bouquet or a spray fresh from California's verdant hillsides. It is hoped to hold this day in the early spring.

The flowers are now being obtained from the homes of many of the doctors, who bring the blossoms to the hospitals along with their instrument cases, from the gardens of many friends of the Center and from the grounds of the Center itself, portions of which are beautifully landscaped. The activity is under the direction of Mrs. Philip Caxon, head of the volunteer unit.

The unit is composed of volunteer women workers who devote their spare time to aiding the sick and distressed. Thus far it has been enabled to obtain enough flowers once a week for every patient. Most of the patients take every precaution to keep each bouquet as fresh as possible until the next bouquet arrives, so that they will have flowers at their bedside at all times. Even the most "desperate" cases seem able to obtain rest and comfort from the flowers, Mrs. Caxon reports.

The regular arrival of the bouquets is proving a boon particularly to the clinic patients, many of whom are unable to raise gardens or have any flowers of their own.

Sale of Certain Rodents Restricted in California.—Because chipmunks, golden mantled squirrels, and other rodents have been found to suffer from plague, the California State Board of Public Health has imposed restrictions upon the sale of such rodents as indicated in the following resolution of the board, issued August 17, 1937. The general public is advised not to handle such rodents, and dealers are warned that the requirements of this order must be observed:

"WHEREAS, It has been determined that plague infection has been found to exist in chipmunks in certain areas in California and other western states, and furthermore, it has been determined that this infection may be transmitted to man; and

"WHEREAS, It has become urgent to take all necessary precautions to prevent the transmission of plague infection to human beings as well as to protect this state in its sanitary relation with other states and countries; therefore,

"Be it ordered, under the authority vested in the Director of Public Health by Sections 2979 and 2979a of the Political Code of California, and the Public Health Act of this state, as amended, that the shipment or sale of chipmunks and/or golden mantled squirrels or other wild rodents be prohibited unless said chipmunks or golden mantled squirrels or other wild rodents are held in quarantine for a period of two weeks prior to date of shipment or sale, in either domestic or foreign trade. During this period of quarantine said animals are to be maintained in individual cages and any animal dying during the period of observation shall not be destroyed but shall be reported at once to the local health officer. The health officer shall thereupon communicate with the State Department of Public Health for instructions regarding the shipment of the animal to the state laboratory for examination. If any chipmunks and/or golden mantled squirrels or other wild rodents have been trapped in the same general area in which an animal has been found to be plague-infected, the entire consignment shall be destroyed."

Press Clippings.—Some news items from the lay press, on matters related to medical practice, follow:

Dr. Frank F. Barham Heads University of Southern California Alumni

Dr. Frank F. Barham, publisher of *The Evening Herald and Express*, today had been chosen president of University of Southern California's mighty Alumni Association.

Doctor Barham was declared elected and was installed at the annual meeting of the board of directors last night. He will serve during the academic year of 1938-39, succeeding Dr. Carl Howson, who was president during the past year.

Doctor Barham, long active in affairs of the General Alumni Association at University of Southern California, won distinction in 1936 when he served as chairman of the committee conducting Homecoming Week. Last year Doctor Barham held the office of president-elect.

The new alumni president is a graduate of University of Southern California School of Medicine and was a member of the class of 1906.

In his new position Doctor Barham will lead the activities of fifty thousand University of Southern California alumni members scattered throughout the world. There are Trojan alumni clubs in Paris, Hawaii, New York, Manila and the Orient, and in almost every city of any size in the United States.—Los Angeles *Evening Herald*, June 30.

Tuberculosis Doctors Elect

Livermore Physician President

Los Angeles, June 22.—(AP)—Dr. Chesley Bush of Livermore today was elected president of the National Tuberculosis Association, succeeding Dr. J. Arthur Myers of Minneapolis.

Dr. Frederick T. Lord of Boston and Dr. Paul P. McCain of Sanatorium, North Carolina, were named vice-presidents. Honorary vice-presidencies went to President Roosevelt and Dr. Henry D. Chadwick of Boston. . . .

The convention heard Dr. W. P. Shepard, of the Metropolitan Life Insurance Company, San Francisco, urge tuberculosis examination as a part of every school program.

"No proper school health or public health program can afford to overlook tuberculosis," Doctor Shepard said. He placed the average cost of a general health program at $1.70 per pupil per year, and said tuberculin testing, x-ray, and follow-up of positive reactors would increase that figure to about $2.30.—San Francisco *Examiner*, June 23.

Chief Surgeon Walter B. Coffey Retires; Is Succeeded by Dr. Calvin A. Walker as Hospital Department Head

More than forty-two years' association with Southern Pacific's Hospital Department, the last twelve years as chief surgeon and manager, came to a close for Dr. W. B. Coffey on July 1 when he retired under the company's pension system to be succeeded by Dr. Calvin A. Walker.

Holding high rank in Pacific Coast medical circles and internationally known for contributions he has made to the advancement of his profession, Doctor Coffey was honored with a banquet at the Fairmont Hotel in San Francisco on June 27 attended by 180 medical associates and railroad officers, when the retiring chief lauded the fine support received for so many years from members of his staff.

Southern Pacific was the nation's first railroad to establish, in 1867, a hospital department for the exclusive use of its employees. Down through the years the services of the department and excellency of its facilities have been expanded and improved under the direction of a succession of distinguished chief surgeons that included Drs. A. B. Nixon, T. W. Huntington, Mathew Gardner, F. K. Ainsworth, and the now retiring W. B. Coffey.

In recent years the Hospital Department has been favored with very generous financial gifts from Edward S. Harkness, one of Southern Pacific's directors, which funds Chief Surgeon Coffey has used in equipping the General Hospital at San Francisco and the Tuberculosis Sanatorium at Tucson with facilties for research, treatment, and surgery that establish those institutions as the finest maintained for employees by any industrial organization in the country, perhaps in the world.

Doctor Coffey has been a staunch advocate of the periodic "check up" for officers and employees so that ailments may be detected and treated before they cause serious damage to health.

The retiring chief surgeon graduated from Cooper Medical College, now Stanford University Medical School, in 1889, since which time he has practiced continuously in San Francisco. He became district surgeon for Southern Pacific in January, 1896; was appointed division surgeon in October, 1905, and assistant chief surgeon in August, 1923, succeeding Chief Surgeon Ainsworth on his retirement in August, 1926. He was a founder of the St. Francis Hospital in San Francisco in 1905, and is now president of that organization. Prior to taking over the duties of chief surgeon for Southern

Pacific, Doctor Coffey held the same position with the Market Street Railway. He was one of the organizers and was first president of the Pacific Association of Railway Surgeons.

Doctor Coffey will continue his active practice and research work in San Francisco.

Doctor Walker has been actively connected with the General Hospital in San Francisco almost continuously since graduating from Cooper Medical College in 1905. He was in Europe for several months during that year taking postgraduate work in various cities, and returned in July to become an intern in the railroad's general hospital. Following the earthquake and fire of 1906 he was transferred with patients to Sacramento where he became assistant surgeon in July, 1906. In November that year he returned to San Francisco as emergency surgeon for the district south of Market Street, and in January, 1910, was appointed district surgeon in that city. For four years prior to joining the United States Army Medical Corps in April, 1918, he had been a visiting surgeon for the company in San Francisco. At the time the armistice was signed he was ready to sail for France as commander of Field Hospital No. 234. Returning to Southern Pacific in May, 1919, he resumed the duties of visiting surgeon; was appointed Coast Division surgeon in February, 1927, and has been supervisor of surgical services at the General Hospital since May, 1936.

For several years Doctor Walker has been a member of the medical staff of the Market Street Railway, also handling the industrial surgical work of the California Street Cable Railway, and is a director of the St. Francis Hospital. —Southern Pacific *Bulletin*, July, 1938.

FERA, New Deal Agency, Dead*

Congressional Lease of Life Ends for Once Big Spender

Washington, June 30. — (AP) — A bookkeeper drew a double red line in a ledger in the WPA office here today, and the Federal Emergency Relief Administration, one of the oldest and richest agencies of the New Deal, gave up the ghost.

Its cash register once sang to the tune of $1,000,000,000 per annum. But when its Congressional lease on life ran out at the end of the fiscal year today its assets amounted to only $250,000. This automatically goes to the Treasury to pay any claims on the FERA estate.

FERA was born on May 22, 1933, when a young social worker from New York, Harry Hopkins, came to Washington and was made administrator of the new agency, which was to distribute Federal funds to the states, chiefly for direct relief.

Young Hopkins took over an office in the crowded RFC Building, sat down and started the career of FERA.—San Francisco *Examiner*, June 31.

* * *

July 4 Death Toll Reaches 476 in Nation

Twenty-two Fatalities in California

America's three-day Independence celebration by last night had taken a toll of 476 lives—eight of them in northern California—with scores of others so critically injured that a final count this morning may bring the total close to last year's record of 563 deaths.

There were twenty-two deaths throughout California.

A national survey of the casualties by the Associated Press chalked up 245 auto traffic deaths, 126 more in drownings, twelve killed by trains, twenty-three dead in shootings, nineteen suicides, only three from fireworks, and forty-seven from various other causes.—San Francisco *Examiner*, July 5, 1938.

* * *

Doctors Study Venereal Diseases

State to Pay Students During Course

Twelve young physicians today started the first postgraduate training course in venereal disease control at the University of California, Dr. Malcolm H. Merrill, chief of the state's Bureau of Venereal Diseases, said.

Under a $12,000 grant from the State Department of Health, they will be paid during the three months they attend classes and during the next nine months of field clinics.

They will then be employed by the Bureau of Venereal Diseases in clinics throughout the state.

Those taking the course include:

Drs. Katherine H. MacEachern, E. Glenn Wood, and William F. Conrad, Los Angeles; Edward Hirschberg and Carl P. Jensen, Fresno; James W. Moreland, San Bernardino; H. C. Pulley and Helen Mackler, San Francisco; W. L. Turner and Russell Frantz, Santa Barbara; Philip K. Condit, Oakland; and Chester M. Weseman, Sacramento.—San Francisco *News*, July 5, 1938.

* FERA was the agency that allocated Federal funds for the "California Medical Economic Survey."

Old Age Pensioners in California

Sacramento, July 5.—(AP)—Cost of old age assistance continues to mount, statistics of the State Department of Social Welfare indicate.

The total for May of this year was $3,748,021, compared with $3,606,284 for April. A year ago the May total was only $2,379,678.

There are 116,040 individuals receiving old age assistance. The average payment per person is $32.53.

Just before the old age law was liberalized, it was tentatively estimated that the normal increase which could be expected due to greater numbers of persons attaining the requisite age would be 20 per cent a year.

Lowering of the age limits and the years of residence have accounted for the greater part of the big increase in the total number receiving financial assistance since the pension was established.

47,092 on Roll at Los Angeles

As recently as June, 1935, there were only 21,310 persons in the entire state drawing old age pensions. Los Angeles County alone now has 47,092 on its rolls.

The ten counties with the next largest number receiving old age aid are:

San Francisco, 8,285; Alameda, 6,981; San Diego, 5,709; San Bernardino, 3,973; Santa Clara, 3,094; Fresno, 2,760; Sacramento, 2,917; Riverside, 2,695; Orange, 2,483; and San Joaquin, 2,161.

All of the other counties have fewer than two thousand on their lists.

Sparsely settled Alpine County has only eleven old age pensioners; Mono has only sixty-two. The latter's average payment at $35 a person, is the highest for the state.

Those having between 1,000 and 2,000 are: Humboldt, 1,218; Butte, 1,434; Kern, 1,400; Santa Barbara, 1,058; Santa Cruz, 1,175; Sonoma, 1,812; Stanislaus, 1,233, and Tulare, 1,689.

Alameda's cash disbursements average is the lowest for the state at $30.72.

Each successive California Legislature has increased the benefits payable to the aged.

The state's Old Age Security Act of 1929 provided a minimum age of seventy at which the elderly could draw pensions. This was cut to sixty-five years in 1935. Pensions then were $20 to $35 monthly. The 1937 Legislature left the age limit at sixty-five, but reduced the required residence from fifteen to five years, adding in excess of fifty thousand to the eligible list.—San Francisco *Call-Bulletin*, July 5, 1938.

* * *

Free Syphilis Tests

All City Emergency Hospitals Again Open to Public

The regular Wednesday Wassermann tests for syphilis at all San Francisco's emergency hospitals will be given again tomorrow from 10 a. m. to 10 p. m., Dr. J. C. Geiger, city health officer, announced today.

Doctor Geiger reminded San Franciscans that these tests are free and confidential and are offered the public weekly, both for the benefit of individuals and also to determine the prevalence of syphilis in San Francisco.—San Francisco *News*, July 5, 1938.

* * *

Supervisors Told How to Save Million Dollars

Counsel Rules Persons on Relief Can Be Sent to Other States If Kin Can Support Them

Estimated to give an annual saving within the county of about a million dollars if it can be made effective, legal opinion yesterday was given the Board of Supervisors that approximately sixteen hundred persons on relief rolls here can be sent back to other states if relatives there can support them.

Deputy County Counsel Claude McFadden, who submitted the ruling, ruled on the case of a woman who refused to return to the Oregon home of a brother, who was willing to support her. She is on relief here.

The ruling affects so-called technical nonresidents of the state under the state law which requires that persons coming here from other areas must be self-maintaining for at least three full years before applying for relief, if they are to perfect their California legal residence.

Executives of the county's department of charities have denied aid to many of these persons, forcing them on the rolls of private relief agencies, but no direct ruling was made until yesterday that county funds cannot be legally used in aiding these indigents, even if they have lived here for many years but have not been self-supporting for any three years of a period.—Los Angeles *Examiner*, July 6, 1938.

* * *

Population in 1988 Mostly Middle-Aged

Washington, July 5.—(AP)—President Roosevelt made public tonight a report predicting that the American population, after attaining a peak of 158,000,000 by 1988, would

dwindle thereafter and would consist largely of old, or middle-aged people.

The prediction was made by the committee on population problems and was transmitted to the White House by the President's national resources committee.

The experts estimated that between 1935 and 1975, the number of persons twenty to forty-four years of age would increase only 6 per cent, whereas the number forty-five to sixty-four years old would increase 69 per cent.

Peak May Be 138,000,000

Persons over sixty-five, now comprising about 6 per cent of the population, will constitute 15 per cent of it in 1980. People under twenty, now about 37 per cent of the population, will be only about 25 per cent in 1980.

All this, the committee suggested, might be circumvented by relaxation of present bars to immigration and by a reversal of the diminishing birth rate, but in the long run a halt in the population increase might not be such a bad thing after all.

While the committee leaned toward a population estimate of 158,000,000 by 1988 it said there was a possibility that the peak might actually be 138,000,000 and that it might be reached as early as 1955.

Indians Increasing

Discussing births, the survey said white and Negro groups now are reproducing at about the same rates, while the American Indians are the most rapidly increasing racial stock in the country.

The report declared that the members of the committee, which included prominent students of population, eugenics, genetics, and sociology, were not advocating a general reduction in the size of families.

Instead, they favored lifting the burden of carrying individuals and families unable to support themselves off the back of individuals and families now paying the bills.

Then, the report added, the latter families would be able to raise more children, thus changing the present situation in which families on relief average many more children than the nonrelief groups.—Los Angeles *Examiner*, July 6, 1938.

* * *

British Doctor Freed by Jury

London, July 19.—(INS)—Eminent doctors today applauded a jury's verdict freeing Dr. Aleck William Bourne, one of England's most noted gynecologists, of criminal charges because he spared a fifteen-year-old assault victim motherhood.

Doctor Bourne admitted performing an illegal operation upon the girl, victim of assault by a group of soldiers, and invited prosecution on behalf of the gynecologists of the nation.—San Francisco *Examiner*, July 20.

* * *

Social Disease Work Outlined

Part of Federal Fund To Be Used to Help Those Unable to Pay

Washington, July 14. — (AP) — Government physicians today said that the major part of a new $3,000,000 fund for control of venereal diseases will be devoted to treatment of persons who cannot pay for private care.

Members of the public health service's venereal diseases division said funds will be distributed to every state for use in buying medicines, establishing or aiding clinics, financing educational work or paying salaries of persons engaged in control activities.

For these purposes, $2,400,000 will be divided among the states, in the present fiscal year, on a basis of population, financial needs and the extent of venereal disease.

The federal service is retaining $600,000 for the development of prevention, treatment and control methods.—Los Angeles *Times*, July 18.

* * *

British Doctors Threaten Strike

London, July 7.—(AP)—British doctors threatened a possible "stay-in strike" today to prevent admission of additional Austrian physicians to practice in this country.

Dr. A. Welply, general secretary of the Medical Practitioners Union, said if representations to members of the House of Commons failed "much more drastic action will be taken—something will be done to arouse the whole country; it may possibly develop into what is known as a stay-in strike."

Welply asserted foreign doctors were not required to study as long as qualified British physicians.—San Francisco *Chronicle*, July 8, 1938.

* * *

U. S. to Survey California Welfare Outgo

A study by Washington authorities of how California is spending $24,000,000 a year in federal funds on social welfare will begin shortly, it was disclosed here yesterday.

Miss Jane Hoey, director of the Social Security Board's bureau of public administration, is already in the state making final arrangements for the study. Eight experts will arrive from the East later this month to begin operations.

The woman director said the study had been requested by the State Social Welfare Board with the assent of Director Mrs. Florence Turner and Governor Merriam.

The study will concentrate in the metropolitan areas of San Francisco, Los Angeles and Alameda counties. A typical San Joaquin Valley county, however, also will be studied.

Relief workers in San Francisco will be checked to determine if they are functioning properly under the laws by which the Federal Government matches state funds.—San Francisco *Chronicle*, July 8, 1938.

* * *

Letterman Hospital Addition Assured

Unofficial but authoritative advices that PWA construction of three new wings for Letterman General Hospital has been approved were received here yesterday by Representative Franck Havenner.

The additions, Havenner said, will replace the old wooden wards which line the front of the hospital and have been branded as fire menaces.

One new ward, Havenner said, will be for officers, one for women, and the third for enlisted men.—San Francisco *Chronicle*, July 8, 1938.

* * *

Migrant Vote May Decide State Election

Majority of 221,000 Workers Eligible to Ballot†*

California's elections may be decided by the votes of migrant farm workers from the Midwest drought area and other states where agriculture and employment have been adversely affected by the Roosevelt recession.

With a large field of candidates for governor, lieutenant-governor and other state offices, as well as for the Legislature, minority nominees at the August primary election may land on top of the heap at the November general election by the votes of the newcomers, many of whom are recipients of government relief.

221,000 in State

According to the U. S. Farm Placement Bureau, more than 221,000 of these farm workers have entered California in the past thirty months. A large proportion of them have been here long enough to establish a voting residence. . . .

Balance of Power

"The drive," states Archie Closson, a Lodi farmer and a former American Legion commander, who is campaigning in the valleys for the Merriam forces, "has as its objective to bring about the defeat of the governor in the belief that the refugees, if they vote as a block, hold the balance of power in the coming elections.

"When we consider that state registrations this year are estimated at more than 3,200,000, it readily will be seen that such calculation is within the realm of possibility. The propaganda, of course, follows the familiar Communist formula of playing on the psychology of distressed and disheartened people."

"The situation," Closson declared, "would be more disturbing were it not for the character of the refugees themselves. Reports from the interior indicate that a large proportion, if not a majority, are earnest, industrious workers, anxious and willing to work. It is their misfortune and California's problem that they were led to come here, seeking work, at a time when there is not enough work to go around."—San Francisco *Chronicle*, July 26.

LETTERS

Concerning an American Museum of Health, Incorporated.

New York, June 11, 1938.

To the Editor:—One of the outstanding exhibits at the New York World's Fair, 1939, Incorporated, will be that of the $400,000 Medical and Public Health Building, already erected on the Main Esplanade and adjacent to the Trylon and Perisphere—the Fair's Theme Center. Here will be displayed in one coördinated, carefully planned set of units numerous exhibits of unparalleled importance to the welfare of mankind.

At the conclusion of the Fair, it is expected that many of the exhibits displayed in the Medical and Public Health

* By Earl C. Behrens.

† For other comment, see page 155.

Building will be removed to a permanent Museum of Health to constitute the nucleus of an influential institution for health education in New York City.

Yours very truly,

EDMUND LEAMY,
Assistant to Secretary.

30 Rockefeller Plaza.

Concerning use of paper milk containers in dairy plants.

(COPY)

June 27, 1938.

Dr. C. U. Duckworth, Assistant Director,
State Department of Agriculture,
Sacramento, California.

Dear Doctor:

I am in receipt of a communication from Mr. O. A. Ghiggoile, Supervisor of Dairy Service, Division of Animal Industry, in which he advises me that the use of paper milk containers in dairy plants distributing milk and cream to the retail trade is contrary to the provisions of Section 479, Paragraph B, of the State Agricultural Code, which section and paragraph require that bottles used in the distribution of milk and cream to the retail trade be washed and sterilized before re-use.

I have carefully reviewed the terms of this section and paragraph and find the context obviously refers to the cleansing and sterilizing of glass containers. Glass containers being frequently refilled must be thoroughly cleansed and sterilized before re-use. This procedure is unnecessary in the case of paper milk containers, which are designed primarily for single use and are delivered at the dairy plant in practically sterile condition. Apparently when this section of the Agricultural Code was drafted no thought was given to the possibility of paper milk containers being used for the retail distribution of milk and cream. Nowhere in the Agricultural Code is any specific mention made of paper milk containers. I am of the opinion that the development of the paper milk containers has reached the stage where health authorities can raise no valid objection to its use in the distribution of milk, cream and milk food products to the retail trade. This statement is based on the fact that many investigators throughout the nation have conducted studies on this subject and have reached the conclusion that in its final form the paper milk container is practically sterile and therefore a suitable medium for the delivery of milk and cream to the retail trade.

Probably the most comprehensive investigation initiated for the purpose of ascertaining the sterility of the paper milk container was that sponsored by the University of Illinois. The findings submitted as a result of this investigation demonstrated the practical sterility of the paper milk containers. This department has had occasion to examine bacteriologically two types of paper milk containers, namely, the finished container delivered at the dairy plant and the finished container which is formed, paraffined, filled and sealed within an automatic machine. I am enclosing for your information reports of the laboratory upon these examinations. These tests have confirmed the belief that to all intents and purposes the paper milk container is sterile. I believe that under the State Agricultural Code the Director of Agriculture has the power to approve the use of paper milk containers provided that after proper investigation and study he is convinced that the use of such container would not be prejudicial to public health nor affect in any way the quality and wholesomeness of the milk.

Up to the present moment the milk distributors of San Francisco have manifested no desire to replace the present glass containers with paper receptacles. One milk distributing concern, however, made inquiry as to the attitude of the department on the use of paper milk containers and as a result of the inquiry submitted to the laboratory for bacteriological examination specimens of the particular type of container he was interested in. This container is formed, paraffined and filled within the machine. Apparently the negotiations have fallen flat, as I have received no further information on the matter.

The order issued by Mr. Ghiggoile prohibiting the use of paper milk containers cannot apply to the milk plant operators in this city due to the fact that paper milk containers are not now in use. In conclusion, I would recommend that further study and investigation be given to this subject before enforcing the terms of the order.

A copy of this letter is being sent to the American Can Company, as we have discussed the question of the use of paper milk containers with them.

Sincerely,

J. C. GEIGER, M.D.,
Director of Public Health.

MEDICAL JURISPRUDENCE †

By HARTLEY F. PEART, ESQ.
San Francisco

Release of One Joint Tort-Feasor as Release of All: Effect of Dismissal by Plaintiff as to One of Several Defendants in a Malpractice Action

An action against a physician and surgeon for alleged "malpractice" is under legal terminology termed a "tort" action. The defendant is called a "tort-feasor." Actions at law based upon the alleged breach of a promise, whether oral or witten, express or implied from conduct, are called "contract" actions. Actions at law based upon an alleged negligent or willful act causing injury to person or property are all classified as "tort" cases and "malpractice" suits fall within this classification.

Now, let us assume that an action alleging malpractice is commenced against Doctor A, a surgeon, against Doctor B, a general practitioner who treated the plaintiff prior to the performance of a surgical operation by Doctor A, against C, a hospital, and against D, a nurse who attended during the operation on the plaintiff. Then let us suppose that plaintiff a few days before the trial accepts an offer of settlement from the C hospital and thereupon dismisses the action as to the hospital. Can the plaintiff then proceed and secure a judgment against the two physicians and the nurse? It is a rule of the common law (which has been adopted in this state in the Civil Code) that the release of one of two or more joint obligations under a *contract* does not release the others, but that a release of one of two or more joint *tort-feasors* acts as a release of all. One reason for this rule is that by accepting a settlement from one of two or more joint tort-feasors an injured person thereby announces that he has received satisfaction for the injury complained of. Another reason is that it would be unjust that the injured party be allowed double payment for the single injury. A third reason often advanced is that the injuries sustained as the result of joint acts by several persons are inseparable and give but a single cause of action, the satisfaction of which by any one of the joint tort-feasors extinguishes the single cause of action as to all of them. There have been several California cases which illustrate the foregoing rule. In

Manson vs. *Casey*
19 Cal. App. 400

the facts were as follows: Plaintiff tripped on a defective sidewalk and was injured. She commenced an action for damages against members of the San Francisco Board of Public Works and eventually accepted the sum of $250 in settlement of her claim against *one* of the members of the board. The settlement document released the member paying the $250 and stated that it was not the intention of the plaintiff that it should operate as a release of the liability of the other defendants. The court held that a plaintiff could not settle with one of several joint tort-feasors without automatically releasing all of the others. The court further stated that it was impossible for a plaintiff to preserve a right of action against those defendants with whom a settlement was not reached.

† Editor's Note.—This department of CALIFORNIA AND WESTERN MEDICINE, presenting copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

In the case of

Lewis vs. *Johnson*
93 Cal. App. Dec. 638

the facts were as follows: Plaintiff commenced an action against two physicians, a hospital and a nurse for damages for alleged malpractice. During the trial the plaintiff settled with the hospital and the nurse and then attempted to proceed as against the two physicians. The court held, however, that the plaintiff had by releasing the hospital and the nurse thereby automatically released all of the defendants. Accordingly, judgment in favor of the defendant physicians was ordered. In this case, as in the *Manson* case, the plaintiff, after releasing one defendant, had endeavored to reserve a cause of action against the remaining defendants. But the Court held with respect to this attempted reservation as follows:

> The attempted reservation of a cause of action against the remaining defendants was ineffectual and void. It is settled that a retraxit as to one joint tort-feasor releases all of the joint tort-feasors, irrespective of an attempted reservation of the cause of action against some of the tort-feasors and regardless of the intentions of the parties.

Hence, it should be borne in mind that in every action for malpractice against two or more defendants based upon one alleged injurious act or omission in which all of the defendants assertedly participated, a release by the plaintiff as to one of the defendants acts as a release with respect to all.

SPECIAL ARTICLES

CALIFORNIA SOCIETY FOR THE PROMOTION OF MEDICAL RESEARCH*

Action taken at the recent convention of the American Medical Association and meetings of various allied medical organizations in San Francisco and Del Monte brought to seventy-nine the formal endorsements of the campaign to defeat California's proposed "State Humane Pound Act," which is to appear on the ballot at the general election in November.

This is the announcement of the California Society for the Promotion of Medical Research (369 Pine Street, San Francisco), conducting a program of education against the measure, which it brands as mistitled antivivisection legislation. The society, headed by President Ray Lyman Wilbur of Stanford University, has on its committee every university president in the state, besides eminent churchmen, physicians, dentists, scientists and lay men and women to the number of more than a thousand.

"It is not medical societies alone which have gone on record in opposition to this proposed measure, though they, of course, know best the dangers that would result from enactment of such a law," says a statement issued by James Leo Halley, chairman of Public Education Week in San Francisco. "Organizations of many kinds have united in calling attention to the grave injury to public health work which such a law would entail."

Opposition to the initiative has been officially recorded by such groups as the San Francisco Chamber of Commerce, the San Joaquin Kennel Club, the National Board of Trustees of the Shriners Hospitals for Crippled Children, as well as the American, Western, California and Catholic hospital associations; Canners League of California, California State Dental Association, and the American Association for the Advancement of Science, the latter with 250,000 affiliated members.

* * *

List of organizations endorsing campaign against the proposed "State Humane Pound Act" in California:

Academy of Science of St. Louis
American Academy of Orthopedic Surgeons
American Academy of Pediatrics
American Association for the Advancement of Science (membership, 18,000; affiliated membership, 250,000)
American Association of Anatomists
American Association of Dental Schools
American Association of Medical Milk Commissions
American Board of Otolaryngology
American Board of Radiology
American Board of Urology
American Clinical and Climatological Association
American College of Chest Physicians
American College of Physicians
American College of Surgeons
American Dermatological Association
American Drug Manufacturers' Association
American Foundation for Tropical Medicine
American Hospital Association
American Medical Association

NEW FEDERAL FOOD, DRUG AND COSMETIC ACT

The new Federal Food, Drug and Cosmetic Act became law in June, 1938, when it was signed by President Roosevelt. Its general provisions will become effective one year from June. Certain provisions become effective immediately.

The new law, in its principal differences from the Federal Food and Drugs Act of June 30, 1906:

1. Brings all cosmetics except toilet soaps under control; outlaws cosmetics which may be injurious to health, except poisonous coal tar hair dyes which bear warning labels; prohibits false or misleading labeling.

2. Prohibits traffic in food which is injurious to health. (The old law prohibits injurious food only when the poisonous substance is added.)

3. Prohibits the addition of poison to food except where such addition is necessary or cannot be avoided in production; where added poisons are necessary or cannot be avoided, tolerances are authorized limiting the amount to a point of safety.

4. Authorizes emergency permit control of food that may be injurious because of contamination with microorganisms, if public health cannot otherwise be protected.

5. Forbids traffic in confectionery containing metallic trinkets and other inedible substances.

6. Specifically requires label declaration of artificial coloring, artificial flavoring and chemical preservatives in food, but exempts butter, cheese and ice cream from this requirement in so far as artificial coloring is concerned.

7. Requires labeling of special dietary food to inform purchasers fully of its vitamin, mineral and other dietary properties.

8. Provides for the promulgation of a definition and standard of identity and a reasonable standard of quality and fill of container for each food, but exempts from this provision fresh and dried fruits and vegetables except avocados, cantaloupes, citrus fruits and melons. Butter is also exempt from this provision, but the Act preserves the statutory definition and standard of identity for butter which became law in 1923. (The old law contains no authority for the establishment of definitions and standards of identity, and the authority to establish standards of quality and fill of container is limited to canned foods.)

9. Requires the labeling of food for which no definition and standard of identity has been fixed to disclose the ingredients by name, except colorings and flavorings, which may be declared simply as coloring and flavoring. Authorizes regulations prescribing exemptions from this requirement where compliance is impracticable or results in deception or unfair competition.

10. Does not contain the "distinctive name" joker of the old law under which any food not injurious to health can escape control.

11. Brings under control drugs used in the diagnosis of disease and drugs intended to affect the structure or any function of the body.

12. Brings therapeutic devices under control, and subjects them to the same general requirements as are set up for drugs.

13. Prohibits traffic in drugs and devices which are dangerous to health under the conditions of use prescribed in the labeling.

14. Prohibits traffic in new drugs unless such drugs have been adequately tested to show that they are safe for use under the conditions of use prescribed in their labeling; authorizes exemption from this requirement of drugs intended solely for investigational use by qualified scientific experts.

15. Makes the Homeopathic Pharmacopeia of the United States the legal standard for homeopathic drugs.

16. Requires labels of official drugs—i. e., drugs recognized in the U. S. Pharmacopeia, National Formulary or Homeopathic Pharmacopeia of the United States—to reveal any differences of strength, quality or purity from the official standards. (The old law requires merely that the label bear a true statement of the strength, quality and purity of the drug, without showing the difference from the official standard.)

17. Requires drugs intended for use by man to bear labels warning against habit formation if they contain any of a list of narcotic or hypnotic habit-forming substances, or any derivative of any such substance which possesses the same properties.

18. Requires the labeling of drugs and devices to bear adequate directions for use, but authorizes regulations exempting drugs and devices from this requirement where it is not necessary for the protection of the public health.

19. Requires the labeling of drugs and devices to bear warnings against probable misuse which may be dangerous to health.

20. Requires special precautionary labeling for drugs that are liable to deterioration.

21. Does not contain the fraud joker in the old law under which the Government must prove that false claims of curative effect on the labels of patent medicines were made with willful intent to deceive.

22. Requires official drugs to be packaged and labeled as prescribed by the Pharmacopeias and Formulary.

23. Defines nonofficial drugs as illegal if the standard of strength differs from the standard claimed. (The old law prohibits only those which fall below the strength claimed.)

24. Requires that antiseptics possess germicidal power.

25. Requires the labels of nonofficial drugs to list the names of the active ingredients, and in addition to show the quantity or proportion of certain specified substances. Authorizes regulations prescribing exemptions from this requirement when compliance is impracticable.

26. Proscribes the use of containers for food, drugs and cosmetics which may render the contents injurious to health.

27. Prohibits traffic in food, drugs and cosmetics which have been prepared or handled under insanitary conditions that may contaminate them with filth or that may render them injurious to health.

28. Forbids the use of uncertified coal tar colors in food, drugs and cosmetics other than hair dyes.

29. Proscribes slack filling of containers for food, drugs and cosmetics, and outlaws the use of deceptive containers.

30. Authorizes factory inspection of establishments producing food, drugs, devices and cosmetics for interstate shipment.

31. Provides for the procurement of transportation records and other documents necessary to establish federal jurisdiction.

32. Requires that part of samples collected by the Government for analysis be given to the manufacturer on request, but provides exemption from this requirement to the extent necessary for proper administration of the Act.

33. Authorizes the Government to charge fees for the certification of coal tar colors in amounts necessary to defray the expenses of the service.

34. Specifically authorizes settlement of minor violations through written notice or warning from the enforcing agency when the public interest can thus be adequately served.

35. Provides increased criminal penalties for violations.

36. Authorizes the federal courts to restrain violations by injunction.

37. Limits seizure for misbranding to a single interstate shipment of the product unless the misbranding has been the subject of a prior court decision in favor of the Government, or unless the misbranded article is dangerous to health, or its labeling is fraudulent or would be in a material respect misleading to the injury or damage of the purchaser or consumer. Authorizes consolidation of multiple seizure cases (seizures of two or more interstate shipments of identical goods from the same shipper) for trial in a single jurisdiction. Also authorizes such consolidated cases, as well as cases involving seizure of a single interstate shipment for misbranding, to be removed for trial to any district agreed upon by stipulation between the Government and the shipper or owner of the seized goods. In case of failure to reach such an agreement, the shipper or owner of the goods may apply to the court in which the seizure was made, and the court is required, unless good cause to the contrary is shown, to specify a district of reasonable proximity to the applicant's principal place of business in which the case will be tried. (The old law places no limitation on the number of shipments of illegal goods which may be seized; contains no provision for change of venue for trial. Seizure cases are tried in the district in which seizure occurs, which ordinarily is the district to which the goods have been shipped for sale and consumption.)

38. Provides for a judicial review in the United States Circuit Court of Appeals to determine the validity of certain regulations. This form of review is an addition to and not in substitution for established forms of review through equity proceedings and proceedings under the Declaratory Judgment Act.

Immediately upon approval of the Act by the President the following provisions became effective:

The prohibition against drugs which are dangerous to health when used in the dosage, or with the frequency or duration prescribed, recommended or suggested in the labeling.

The prohibition against the introduction of new drugs before an application for such introduction becomes effective.

The prohibition against cosmetics which may be injurious to users under the conditions of use prescribed in the labeling or under such conditions as are customary or usual. However, poisonous coal tar hair dyes which would be exempted under the proviso of this requirement if they bore the warning label prescribed by the statute will not be subject to action by reason of their failure to hear the prescribed warning until ninety days after the date of approval.

SOCIALIZED MEDICINE: A RECENT POLL

On the basis of reply blanks received it would appear that approximately 66 per cent of the doctors of California are opposed to a reorganization of medical practice in the direction of socialized medicine, as revealed in the final results of a physician's referendum on socialized medicine conducted by *Modern Medicine*. A total of 16,711 ballots were cast by doctors throughout the nation, giving the greatest direct expression of medical opinion ever recorded on any topic whatsoever, and indicating that the trend of medical thought —except for New York City—is definitely away from socialized medicine, the editors announce.

On the question as to whether public funds should be used to pay the cost of medical care for the indigent and low income group, 54 per cent of California doctors replying voted in favor. However, 83 per cent of those who replied voted support of the present policies of the American Medical Association in studying all plans of making a high standard of medical care available to all people under the control of each community.

Of the specialists in California, 61 per cent of those who replied voted against reorganization, but of the general practitioners, about 68 per cent. Among replying doctors in metropolitan centers in California (cities over 50,000), 63 per cent voted against reorganization. Of the specialists, 58 per cent who answered the questionnaires favored the use of public funds to pay for medical care, while of the general practitioners, about 50 per cent.

The final results obtained in the publication's referendum on socialized medicine are at great variance with the recently published "Gallup poll," which, under the sponsorship of the American Institute of Public Opinion, reported that seven out of ten doctors favored the principle of health insurance. According to the *Modern Medicine* referendum, in which 16,711 doctors' votes gave a cross-section of medical opinion throughout the whole United States, active practicing doctors in the United States definitely oppose the reorganization of medical practice by a vote of two to one.

They reported that they knew of very few cases, not more than one in ten, where individuals or families, claiming inability to pay, were not getting whatever medical care a physician himself can provide. They showed a slight preference (55 per cent) for the use of public funds to pay for medical care for the indigent and low income groups. They strongly approved the present policy of the American Medical Association by a vote of 17 to 3.

This vote showed a definite trend of opinion among United States doctors away from socialized medicine. In 1935, in a similar survey conducted by *Modern Medicine*, 43 per cent of 6,044 doctors voted favoring a change in the administration of medical practice. In 1938, two out of three doctors among the 16,711 voting opposed reorganization.

Among doctors who replied yes to the question on the physicians' referendum which read: "Do you know of any case in your community where an individual or family, claiming inability to pay, has been refused whatever medical care a physician could provide?" many amplified their answers to the effect that the so-called "claim" of inability to pay was false and that care was sometimes refused to individuals who spent their money on luxuries, vacations, transportation, liquor and gambling while owing bills and telling the doctor they could not pay anything at all for his services.

The greatest opposition to reorganization of medical practice was found among country doctors and general practitioners who had been in practice for more than fifteen years. In this poll, reorganization of medical practice found most favor among general practitioners who were earning less than $3,000 a year, and who were practicing in large cities.—*Modern Medicine*, July, 1938.

POPULATIONS OF LARGER AMERICAN CITIES: STRIKING AGE CONTRASTS

A relative preponderance of elderly people is characteristic of most of the principal cities of the Pacific Coast states. In fact, according to the last census, there are more cities of elders in the Pacific Coast states than in any other main geographic division of the country. Of all our ninety-three large cities, that is, those which had more than 100,000 population in 1930, there are eighteen in which more than 6 per cent of the population in that year was in the age range 65 and over; and seven of these cities are in the three Pacific Coast states, four of them being in California.

Long Beach, Calif., with 9.2 per cent of its population over 65 years of age, is, in this sense, the oldest of America's large cities, although it is closely followed by San Diego, in the same state, with 9.1 per cent. These two cities, in fact, stand out from all the rest, as the third city in order is Spokane, Wash., with only 7 per cent of its population over 65 years. Tacoma, Wash., and Denver, Colo., are bracketed for fourth rank with 6.9 per cent. In New England there are three cities with a large contingent of old people, namely, Lowell, Lynn, and Somerville—all in Massachusetts. Cincinnati and Grand Rapids are the only representatives of the East North Central region; in the Middle Atlantic states there are four, namely, Albany, Reading, Rochester, and Utica; and in the West North Central group only one, namely, St. Paul.

The existing age distribution, as must be well known to our readers, is the result of a gradual drift towards older ages that has been taking place for many decades, due mainly to the declining birth rate, with consequent lessening in proportion of young people in the population. This is a general phenomenon observed in the population of this country at large, as well as abroad, and, with few exceptions, individual cities have shown a drift in the same direction. Which of the ninety-three large cities included in our table has registered the greatest increase in proportion of its older people, since the beginning of the present century, cannot be told, because ten of these cities were small places at the beginning of the century and we have no data regarding their age distribution at that time. However, of eighty-three cities for which it is possible to make comparison between 1900 and 1930, we find that Spokane leads in this respect, with an increase in the proportion of the population over age 65 from 1.9 per cent in 1900 to 7 per cent in 1930. In two other cities in the State of Washington—Tacoma and Seattle—the proportion of persons over 65 years of age practically tripled in thirty years, and the same is true of Duluth, Minn., which exhausts the list of cities showing a threefold or greater increase in the proportion of those 65 or more years old. Cities in which this proportion has doubled, or more than doubled, are Denver, Fall River, Kansas City (Kansas), Kansas City (Missouri), Minneapolis, Omaha, Portland (Oregon), and St. Paul.

There are only two large cities in the United States—Akron and Detroit—in which the proportion of persons 65 years and over has declined since 1900.

Gary, Indiana, is the country's youngest among all the cities of more than 100,000 population, with only 1.7 per cent of its inhabitants aged 65 years or over.

Special interest attaches to the five largest cities (those of more than 1,000,000 population). Detroit is by far the youngest, when measured by its proportion of old people—only 2.8 per cent. New York (3.8 per cent) is decidedly a young city, as is Chicago, with exactly 4 per cent. The Philadelphia population, with 5.1 per cent in the 65 and over group, is older, while Los Angeles, with 6.2 per cent, is the oldest among America's five largest cities.

Turning now from extremes to a consideration of what might be thought the most typical cities, namely, those at or around the middle of the list, in order of rank, we find five—Toledo, Salt Lake City, St. Louis, Paterson, and Kansas City (Kansas)—with the median of 5.2 per cent of persons 65 or more years old. It is interesting to observe that this comes very close to the general average for the United States population as a whole, that is, 5.4 per cent.

It will be noted that the cities with the highest contingents of old people are places distinguished by equable climate, and by the facilities for rest and recreation which these communities provide. Old people who have been able to retire and to live on private income, savings, retirement

funds, or annuities are wont to make such cities their permanent places of residence in their declining years. On the other hand, it is, for the most part, large industrial areas (like Gary, Birmingham, Detroit, Flint, and Akron, for example) which, in their rapid growth, and because of the opportunities that their industries offer, have attracted the young and vigorous in search of remunerative employment. —*Statistical Bulletin, Metropolitan Life Insurance Company.*

Per Cent of Population at Ages 65 and Over, In Certain Cities of the United States with a Total Population of 100,000 or More in 1930; Compared with Corresponding Percentages for the Same Cities in 1900, 1910 and 1920

City	Per Cent of Population at Ages 65 and Over 1930	1920	1910	1900

CARBON MONOXIDE HAZARDS IN TRAFFIC ACCIDENTS IN CALIFORNIA

The Industrial Hygiene Service of the California State Department of Public Health, Dr. John P. Russell, Chief, has issued a preliminary report covering the carbon monoxide hazard in relation to California highway traffic casualties. Doctor Russell was assisted in making the survey of such hazards by Sergeant George S. Zelk, Bureau of Commercial Equipment, California Highway Patrol, and Fred R. Ingram, Senior Engineer, Industrial Hygiene Service, California State Department of Public Health.

In 1937, out of 37,968 traffic accidents on California highways, 597 were attributed officially to "sleepiness" of the drivers of the vehicles involved. It is admitted that fatigue due to long hours of driving and insufficient rest contributes to sleepiness and the theory that the inhalation of engine exhaust gases is responsible in part at least for otherwise inexplicable accidents led to the making of the survey.

Determinations of carbon monoxide in drivers' compartments of motor vehicles were made in nine widely scattered areas of California. This work was conducted on ascending and descending grades, as well as on level highways, under varying weather conditions, including snow, rain and desert heat, at various hours of the day and night, in temperatures ranging from 21 degrees to 74 degrees Fahrenheit, and relative humidities ranging from 18 per cent to 97 per cent.

Most of the vehicles tested were trucks and busses, for the reason that they all fall into the industrial hygiene classification. At a later time, under other auspices, similar tests on passenger cars may be undertaken.

A total of 1,105 vehicles was tested in the survey, and in 2 per cent of the vehicles tested the carbon monoxide concentration was found to be 100 parts per million or higher. Such a concentration of carbon monoxide is sufficient, in some cases, to cause headache, sleepiness and impaired judgment, when inhaled over a period of six to eight hours. In vehicles where such high concentrations are found, potentially dangerous conditions exist, and it is essential that the source of the dangerously high concentration be discovered.

Generally, the defect was traced to one or more of the following defects in the exhaust system: loose exhaust pipe or manifold connection, blown-out exhaust gasket, cracked exhaust manifold, leaky muffler or faulty design of the exhaust system. Exhaust gases escaping from these defects may enter the driver's compartment in large quantities through openings in and around the cab without the driver being aware of their presence. Correction of defects in the exhaust system greatly reduces the amount of carbon monoxide to which the driver is exposed.

In an effort to correlate the effects of inhalation of engine exhaust gases with the ability to drive motor vehicles, five volunteers, including the writers, underwent a series of tests of their steering ability, perception and reaction time, eye-hand and eye-foot coördination, visual acuity, field of vision, depth perception, speed estimation, color vision and glare resistance, before and after the inhalation of known amounts of carbon monoxide during a four-day period.

These tests were made with the coöperation of the Division of Drivers' Licenses, State Department of Motor Vehicles, using instruments and apparatus assembled by them for measuring driving skill. The subjects were first given a series of tests on the instruments to reduce the learning or practice factor. Blood pressure and pulse readings were taken, and determinations of blood saturation with carbon monoxide by the pyrotannic acid method were made. The subjects then spent one hour in an improvised gas chamber, a closed sedan into which engine exhaust gas was introduced by means of a hose from the exhaust pipe. The concentration of carbon monoxide in the chamber, determined by the two carbon monoxide indicators used in the survey, was kept constant by admitting small amounts of exhaust gas from time to time to replace that which leaked out gradually. At the end of the period of exposure, blood samples were again tested, and driving tests were repeated. It was found that exposure to the gas had very little effect on blood pressure, pulse rate, steering ability, visual acuity, field of vision, color vision, depth perception, speed estimation or glare resistance.

The blood saturation readings are not considered reliable, due to inaccuracies in color standards which were not discovered until after the tests were made. However, they suggest that carbon monoxide when inhaled in small amounts day after day has a cumulative effect, and is not completely eliminated from the body in a few hours after exposure, as is commonly believed. Further tests along this line have been planned for the near future.

Braking time represents the interval, in hundredths of a second, elapsing between the appearance of a red light and the application of the brake by the subject, seated behind a set of standard automobile controls, following a moving road scene by manipulating the steering wheel. It was found that the inhalation of an amount of carbon monoxide considered equivalent to that breathed by the driver of a vehicle containing 100 parts per million of the gas during a six to nine hour driving period caused a diminution in driving ability as indicated by headache, muscular weakness and tremors, mental confusion, and a small but definite lengthening of braking time. It is believed that this effect is greatly increased by fatigue such as is experienced by drivers of motor vehicles, particularly heavy trucks or similar vehicles. Plans are being made to conduct further tests under conditions more closely approximating actual driving conditions in order to minimize the learning factor and to include the fatigue factor in combination with exposure to carbon monoxide.

Following are the conclusions reached by Doctor Russell as a result of this preliminary survey:

It is believed that many otherwise unexplained highway accidents, in which experienced drivers, traveling along a straight highway in broad daylight after a good night's rest, run off the road or crash head-on into an approaching vehicle, are due to the driver unknowingly breathing dangerous amounts of exhaust gases escaping from defects in the exhaust system of the vehicle he is operating.

In the absence of defects in the exhaust system, it is believed that there is little danger of carbon monoxide poisoning from engine exhaust gases while driving along the highway.

The exhaust systems of motor vehicles should be inspected carefully, and periodically, for any defects which permit the escape of exhaust gases before reaching the exhaust pipe outlet.

Such defects should be corrected immediately to protect the driver from exposure to dangerous concentrations of carbon monoxide in the escaping gases.

Drivers' compartments of motor vehicles should be fitted with tight floor mats to exclude exhaust gases which may enter through cracks around floor boards. Openings in the dash should be closed as tightly as possible.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XI, No. 8, August, 1913

From Some Editorial Notes:

Ethical Proprietary and "Patent Medicine" All in One.—The favorite way—because the most economical—of introducing a nostrum to the public, is first to exploit it to the medical profession. This was the plan used abroad in introducing "——," the orange-flower flavored syrup of potassium guaiacol sulphonate, the essential constituent of which, the potassium guaiacol sulphonate, had first been popularized to the medical profession under the name, "——."

* * *

The College.—The JOURNAL has been asked by a number of our readers to give some serious information in regard to the proposed "College of Surgeons" and the method of its forming. It grew out of the clinical congress of surgery held in New York last year. These clinical congresses were started by Doctor Martin, editor of *Surgery, Gynecology and Obstetrics,* and a large number of doctors attended them, as clinics are always attractive and some of the most prominent surgeons in the country participated. The idea of forming a "college of surgeons" was sprung at the New York congress, and met with the approval of the mob of those in attendance. It is said that a corporation was then formed, of which Murphy and Martin were two of the five directors, and the proposed name was thus legalized. The scheme was talked over all over the country quite naturally and a meeting was called to take place in Washington in May. . . .

* * *

Preaching Advertising Honesty.—A most significant feature of the annual convention of the advertising men of the country, recently held in an eastern city, was the fact that on a Sunday a member of the Ad Association appeared, on invitation, in nearly every church in the city, and delivered an address in the nature of a prayer for honesty in advertising. Little over ten years ago the STATE JOURNAL began its existence with the statement that it would, so far as humanly possible, accept only honest advertisements and would be responsible to its patrons for the character of the advertising. It was the only publication in the United States to take that stand and a lot of people laughed at us for doing it. . . .

From an Original Article on "Gall-Tract Disease—Some Clinical Features Frequently Overlooked in Its Diagnosis," by C. M. Cooper, M.D., San Francisco.—Gall bladder or gall duct colic is essentially epigastric in origin and radiates upwards. With a stone in the cystic duct, the intense pain may be referred to the right of the lower dorsal vertebrae, and since a block in the cystic duct does not cause jaundice, the colic may be wrongly considered of renal origin. When the pain is epigastric, it may occasionally radiate to the legs or to the left arm. . . .

From an Original Article on "Surgical Treatment of Gall Bladder Disease," by Wallace I. Terry, M.D., San Francisco.—One need not look far back in medical literature to learn that gall bladder operations were infrequent almost up to the beginning of this century. The foundation work laid by Courvoisier, Kocher, Langenbuch, Bobbs, Sims, Riedel, McBurney and others attracted more or less attention, but the realization of the importance of gall bladder surgery came from the publication by Kehr, of Halberstadt, of some four hundred operations on the gall bladder and bile ducts. Later Mayo Robson and the Mayos reported large numbers of operations, and the various manipulative procedures were put on a firm basis. . . .

† This column strives to mirror the work and aims of colleagues who bore the brunt of Association activities some twenty-five years ago. It is hoped that such presentation will be of interest to both old and new members.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By CHARLES B. PINKHAM, M.D.
Secretary-Treasurer

Board Proceedings

At a regular meeting of the Board of Medical Examiners held in Native Sons Hall, San Francisco, June 27 to 30, approximately 198 applicants took the examinations, including physicians and surgeons, drugless practitioners and chiropodists.

The legal calendar was unusually large and the following judgments were rendered by the Board:

Archibald E. Amsbaugh, M.D., San Francisco, charged with aiding and abetting, was on June 29, 1938, found guilty and placed on probation for a period of five years, during which time he shall abide by all the laws of the State of California and the United States and report at each San Francisco meeting during the period of his probation.

Robert V. Baker, M.D., Los Angeles, charged with violation of the terms of his probation, was on June 29, 1938, found guilty and his license to practice in the State of California was revoked.

Harvey J. Bosse, D.S.C. (chiropodist), San Francisco, cited on the basis of record of conviction, was found guilty and on June 30, 1938, his license to practice was revoked.

Mahlon C. Cooley, M.D., Los Angeles, cited on record of conviction in connection with the ambulance chasing-insurance fraud, was on June 30, 1938, found guilty and his license to practice in California was revoked.

Morris A. S. Frank, M.D., San Francisco, found guilty October 20, 1937, on narcotic dereliction, was on June 30, 1938, placed on probation for a period of five years, without narcotic privileges.

George Wellington Frasier, M.D., Pine Knot, cited for violation of the terms of his probation, was found guilty and on June 28, 1938, his license to practice was revoked.

Cary D. Frederick, M.D., Los Angeles, cited in connection with the ambulance chasing-insurance fraud trials, was found guilty and on June 28, 1938, placed on probation for a period of five years.

Albert B. Gray, M. D., Dorris, cited for aiding and abetting, was found guilty and on June 29, 1938, he was placed on five years' probation, during which he is prohibited from practicing from December 15, 1938, to March 15, 1939.

William B. Humphrey, M.D., Los Angeles, cited on record of conviction in connection with the Los Angeles insurance fraud cases, was found guilty and on June 30, 1938, his license to practice in this State was revoked.

Louis Kameny, M.D., Oakland, cited on record of conviction of insurance fraud, found guilty and on June 30, 1938, his license to practice in this State was revoked.

Albert B. Liddell, M.D., Los Angeles, cited in connection with the ambulance chasing-insurance fraud, found guilty and placed on probation on June 28, 1938, for a period of five years.

James E. McCue, M.D., San Francisco, cited on the use of fictitious name (Unipathic), was on June 30, 1938, found guilty and placed on probation for a period of five years, with the further penalty that from July 15, 1938, to January 15, 1939, he shall cease practice.

Thomas P. Moore, M.D., Los Angeles, cited on record of adjudication of insanity, license was on June 30, 1938, revoked.

Benjamin Naidis, M.D., Los Angeles, cited on a charge of aiding and abetting, was on June 29, 1938, found guilty and he was placed on five years' probation, with the further penalty that from July 15 to October 15, 1938, he shall cease the practice of medicine in the State of California.

Allen H. Peek, M.D., cited for violation of the terms of his probation, was on June 27, 1938, found guilty and was placed on probation for one year additional to the probationary period of five years imposed on him February 10, 1937.

INTRAVENOUS SOLUTIONS IN VACOLITERS

Just as a matter of good business . . . choose Baxter's

When you can have fine intravenous solutions in your hospital . . . without a cent of extra expenditure . . . then that *is* good business.

When you specify Baxter's Dextrose and Saline Solutions in Vacoliters you are using fine solutions produced by the long experience of highly trained laboratory technicians. You have the advantage of a swift, flexible service, "tailor made" to fit your own problems . . . service being specified today by thousands of the country's finest hospitals.

All these advantages are available to hospitals who use Baxter's Dextrose and Saline Solutions in Vacoliters. They do not pay any more for the advantages of Baxter's solutions. They feel they *must* have *Vacoliter convenience*. They feel they *must* have the service and protection Baxter's can give them. To them . . . and to you . . . it is just *good business*.

Even RESISTANT DIARRHEA RESPONDS

ACCEPTED AMERICAN MEDICAL ASSN

To APPELLA APPLE POWDER (STEARNS)

In a recent article* the author states: "We are convinced that the greatest value that is to be derived from the use of apple powder in the feeding of children will be in the prophylactic use of the material during the hot season, and in incorporating it routinely in the dietaries of individuals suffering an elevation of body temperature. Its therapeutic value is indicated by the fact that out of 1,021 cases of severe diarrhea unresponsive to other types of treatment, 1,005 recovered."

Appella Apple Powder (Stearns) offers these advantages in the treatment of diarrhea, dysentery, and other intestinal disorders:

- **Small bulk**
- **High and uniform potency**
- **Ease of administration (particularly to children)**
- **No curd formation with milk**
- **Increased content of pectin and uronic acid**
- **All the year 'round availability**

Physicians are invited to write for descriptive literature, giving clinical findings, suggestions on dosage, etc.

Appella Apple Powder (Stearns) is supplied in 7-oz. cans for prescription use and in 1 lb. 4-oz. cans for hospital use.

Available through your Prescription Pharmacy.

His First Solid Food

PABLUM is now being fed to infants as early as the third or fourth month because it gets the baby accustomed to taking food from a spoon, but, most important, Pablum early adds essential accessory food substances to the diet. Among these are vitamins B_1 and G and calcium and, perhaps most necessary, iron. Soon after a child is born its early store of iron rapidly diminishes and, as milk is poor in iron, the loss is not replenished by the usual bottle-formula. Pablum, therefore, fills a long-felt need, for it is so well tolerated that it can be fed even to the three-weeks'-old infant with pyloric stenosis, and yet is richer than fruits, eggs, meats, and vegetables in iron. Even more significant, Pablum has succeeded in raising the hemoglobin of infants in certain cases where an iron-rich vegetable failed. Pablum is an ideal "first solid food." *Mothers appreciate the convenience of Pablum as it needs no cooking. Even a tablespoonful can be prepared simply by adding milk or water of any temperature.*

Pablum consists of wheatmeal, oatmeal, cornmeal, wheat embryo, alfalfa leaf, beef bone, brewers' yeast, iron salt, and sodium chloride.

PABLUM IS ADVERTISED ONLY TO PHYSICIANS

Mead Johnson & Company
Evansville, Indiana, U. S. A.

The baby's first solid food always excites the parents' interest. Will he cry? Will he spit it up? Will he try to swallow the spoon? Far more important than the child's "cute" reactions is the fact that figuratively and physiologically this little fellow is just beginning to eat like a man.

"The Doctor": Now in a Permanent Home.—The $150,000 reproduction of the Sir Luke Fildes masterpiece, "The Doctor," first shown by the Petrolagar Laboratories at Chicago's Century of Progress Exposition in 1933, was recently presented by its owners to the new Rosenwald Museum of Science and Industry in that city.

Following the two World's Fairs, "The Doctor" Exhibit went on a tour of 50,000 miles and was viewed by over five million people in eighteen principal cities throughout the country.

Designed to remind the public of the importance of the family physician, it required the full time of the late Chicago sculptor, John Paulding, and the noted artist, Rudolph Ingerle, and a large corps of assistants, and took nearly a year to complete.

In its new location in the Rosenwald Museum it will be seen by millions of visitors annually.

Citrus Juice Valuable Aid to Diabetics.—The increased use of vitamin rich foods, such as citrus fruits and fresh vegetables, has been found to increase the effectiveness of insulin in human diabetes. Dr. L. E. Detrick, of the department of chemistry on the Los Angeles campus of the University of California, made this report to members of the American Chemical Society, meeting at San Diego in connection with the annual convention of the American Association for the Advancement of Science.

Diabetes is usually considered to be due to a deficient production of a substance called insulin, explained Doctor Detrick. The function of insulin is to aid the body cells in their ability to store and burn sugar. With a deficiency of insulin the body can no longer use the sugar. The concentration of the sugar in the blood is raised so high that a great portion of it is lost by spilling into the urine. The physician administers insulin to the diabetic patient in order to prevent the rise of the sugar into the blood, and its loss.

Human beings are dependent upon their diet for an adequate source of vitamins. If the diet is lacking in one or more of these accessory food factors a deficiency disease

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water

. . . RESULTS . . .

Business thinkers . . . buyers of printing . . . are coming more and more to realize that the success of their business is influenced by the quality and grade of printing they use. How much will it cost? has been replaced by "What will it do?" After all, RESULTS is the purpose and plan back of every printing order, large or small.

We, as printers, are just as interested as you are in regarding your printing in terms of RESULTS. It is this attitude, this business policy, that has been responsible for our growth.

So, in trusting your work to our organization, you can be assured that we will do our utmost to help you get RESULTS.

You have no printing need that we have not the talent and capacity to fill. Let us work more closely with you.

develops. This disease is specific for the type of vitamin lacking in the diet.

The diabetic patient is treated therapeutically with a dict which is restricted with respect to carbohydrates, fats, and proteins. A diet adequate in these substances may still be deficient in vitamins. European as well as American investigators have considered diabetics as a group to be suffering from a lack of one or more of the vitamins.

Vitamin deficiency in the human body eventually results in a condition where the life processes in the tissue cells are impaired with respect to their ability to store and utilize sugar, Doctor Detrick explained. Insulin administered to a diabetic patient deficient in one or more of the vitamins does not act as effectively as in the normal individual. Increasing the vitamin intake aids the activity of insulin even to the point where the amount administered daily may be reduced.

Starvation, Alcohol Produce Cirrhosis.—Starvation and chronic alcoholism work hand in hand to produce the "drunkard's disease," cirrhosis of the liver, Dr. Charles L. Connor, professor of pathology at the University of California Medical School, told members of the American Medical Association in San Francisco.

In tracing the development of cirrhosis, Doctor Connor pointed out that it follows the steady infiltration of fat into the liver. This infiltration occurs, he said, where, because of lack of intake or absorption of food, fat is mobilized in the liver from fat deposits in other parts of the body, and where, because of internal interference with the metabolism of fat, the accumulated fat cannot be broken down for use by the body. In the first case infiltration is caused by lack of food, in the second by what might be called internal starvation. In both cases normal metabolism does not take place.

Normal metabolism is altered by the various wasting diseases, by diabetes, and by the introduction of poisons which prevent normal tissue oxidation. The most common of these poisons is alcohol.

Doctor Connor said that alcohol alone will cause some fatty infiltration of the liver but, as relative and sometimes absolute starvation is constantly associated with severe chronic alcoholism, the development of cirrhosis most often depends on a combination of the two.

Experiments conducted by Doctor Connor at the University revealed that carbodydrates seem to be the food elements which are most essential if cirrhosis is to be avoided. Fatty infiltration of the liver, he pointed out, nearly always depends on the fact that carbohydrate has become unavailable for tissue oxidation. The clinical histories of cases of definite cirrhosis, Doctor Connor said, all have several common factors. They have all drunk a great deal of alcohol during the last few years before death, and they have been upon a very irregular diet, sometimes amounting to complete fasting. This diet has nearly always been low in carbohydrates.

The San Francisco Session of the American Medical Association.—More than 6,000 physicians registered their attendance at the San Francisco session, making this the largest meeting of physicians ever held on the Pacific Coast. Noteworthy features of the meeting were the message of Miss Josephine Roche announcing the National Health Conference, to be held in Washington July 18-20, and the reply of the House of Delegates to that message (see pages 52 and 56), the numerous resolutions concerning the relations of physicians to hospitals and to the public, and the Scientific Exhibit. This exhibit has come to be recognized as a week of opportunities for graduate education not equaled by any similar opportunity available to the medical profession.

Contrary to the expectations of agitators who endeavored to incite disharmony and revolt among the physicians who represent the medical profession in the House of Delegates, the House displayed a singleness of purpose and soundness of attitude in its concern with the important questions which came before it. The fundamental principles adopted at Cleveland were reiterated as basic to a high quality of medical service. The importance of economic factors in a solution of the health problem was emphasized. The impor-

(Continued on Next Page)

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

(Continued from Preceding Page)

tance of education of the public, using all the available means for reaching great numbers of people, was again recognized and the work of the headquarters office toward that end was unanimously approved.

In the scientific sections the attendance was frequently beyond the capacity of even the large halls which had been assigned to them. Moreover, many of the topics which have been in the forefront of medical consideration during the past year were exhaustively considered, including particularly blood dyscrasias, industrial diseases, and new methods in the treatment of psychiatric conditions.

Exhibitors in the Technical Exhibit expressed great satisfaction in the attendance and also in the newness of the audience which they were enabled to reach. This audience included great numbers of physicians from the Pacific Coast and Far Western states who do not frequently have opportunity to attend an annual session of the American Medical Association, with all the varied opportunities for medical advancement that such a session offers.

The medical profession of San Francisco, and particularly the officials who were concerned with the arrangements for the annual session, deserve the appreciation of all the members of the Association for the efficiency with which they worked. Particularly must credit be given to Dr. Howard Morrow, elected vice-president of the Association, as chairman of the local Committee on Arrangements. For a year he had been working on the plans for this session. An unfortunate illness made it impossible for him to participate in any of the activities of the week of the annual meeting, but even while incapacitated in bed he kept constantly in touch with the various affairs, ably assisted by two physicians, Dr. Junius B. Harris and Dr. J. C. Geiger, who took care of the details for him.

The many visitors to the annual session, including members of the House of Delegates, expressed almost unanimous satisfaction with the San Francisco session as the most successful medical meeting ever held on the Pacific Coast.—*Journal of the American Medical Association*, July 2, 1938.

VEGEX • CLINICAL DATA

MUCH of the relationship of vitamin deficiency to deficiency diseases has been pioneered with the Albino rat. In maintaining vitamin B complex potent products, feeding in a ration devoid of and not borrowing any missing vitamin B factors has, throughout with us, been found the most dependable of all the tests. The Sherman-Chase technique is our preference for assaying the single B_1 factor, but the International test for B_1 where required is employed.

At recent medical exhibits lack of confidence among physicians in the rat test has been sensed. Obviously, one reason is that a single factor of the B vitamin group, held forth to have stated units of the antineuritic or the growth factor, may not show these units and results unless the other factors with which the units were gotten are at hand for the physician.

Physicians want clinical data with human subjects. Vegex can supply it.

The workers find Vegex of uniform potency in the B vitamin complex; in the extrinsic factor (anemia). Groen and Snapper also mention the intrinsic factor. The iron content, 0.05%—partly from the grain mash and partly reinforced with ferrous malate, with the copper complement of 0.00245%—the copper coming from the yeast and not added—undoubtedly have significance.

VEGEX IN ANEMIAS

Conservatism must be the rule in projecting products for use in human disease. The recovery and life of the patient, the professional reputation of the physician are at stake. The aid shown in the anemias has really lagged behind medical reports in presenting Vegex to the physicians. It is as it should be. With the use in macrocytic anemia reported by Sturgis, inquiries from physicians are renewed.

Groen and Snapper, in an article in the American Journal of the Medical Sciences, May 1937, entitled "Dietary Deficiency as a Cause of Macrocytic Anemia" reports a case as follows:

> "After a control period on a meat-free diet, during which the blood findings did not change, the child was given a mixed diet containing plenty of meat, fruit, vegetables, and one liter of milk daily (Fig. 6). The number of reticulocytes rose to 14%, hemoglobin and erythrocytes to 39% and 1,500,000 per c.mm., respectively. On further addition of three teaspoonfuls of '*Vegex*' (a preparation rich in B vitamins) to this diet a second reticulocyte response was obtained: the reticulocyte count rising this time to 18.4%. Hemoglobin and erythrocytes increased rapidly; April 5, 2 months after her admission, the hemoglobin was 80%, the erythrocytes 4,000,000 per c.mm.; the Price-Jones curve had returned to normal and the excess of urobilin had disappeared from the urine."
>
> "A *second gastric analysis* now showed a completely normal curve. One and one-half hour after the test meal the acid values were 36 free and 48 combined hydrochloric acid. There was an abundant flow of gastric juice from the tube (Fig. 7)."
>
> "After her discharge the patient was kept on a mixed diet. Her general and hematologic condition remained excellent as verified at a recent examination. Neither during the treatment nor after her discharge did she receive any liver or iron."

Some fifty-four medical reports of independent research show the value of Vegex in the anemias. Included are the American workers Strauss and Castle, Rhoads, Lawson and Payne, Sturgis, West, in a summary, finds that the extrinsic factor in Vegex had been established. This factor was postulated and demonstrated by Strauss and Castle.

In pernicious anemia, Vaughan in "The Anemias" summarizes that certain patients respond to "large doses." Wilkinson, Klein, Ungley, Wills state that Vegex is of distinct value in maintenance cases and definite value as an aid in the liver extract and other treatment.

With Vegex, liver diets are more regularly sustained. Ungley, in the Quart. Journ. Med., July, 1933, page 381, says "in addition to the effect of Vegex-Marmite on blood regeneration and upon symptoms referable to anemia, there occurred an increase in the sense of well-being, and a marked increase in appetite."

The larger intake of Vegex which recent workers emphasize, can be had in hot or cold water. It is tasty in milk, soups and with butter on bread or toast. In anemia research Vegex has been used in the amounts of from 20 to 50 grams daily.

Vitamin work with the rat demonstrates the need for all of the known vitamin factors, with the rest of known balanced nutrition, including a mineral balance.

VEGEX for B VITAMINS

Autolyzed Brewers' Yeast Extract with salt, added iron salt and pure vegetable flavoring. A level teaspoonful supplies 3 calories. Vegex is free of starch and sugar.

VEGEX ANALYSIS

VITAMIN FOOD CO., INC. **122 Hudson Street • New York, N. Y. •** **VEGEX, INCORPORATED**

"I use Cutter's Tetanus Antitoxin syringe. It's handier and smoother working; and besides, with Cutter's I've practically forgotten there is such a thing as a serum reaction."

Cutter's antitoxin syringe is handier and smoother working because we "planned it that way." Cutter antitoxins need no knocked down syringe to create the optical illusion of concentration, so the syringe was designed from the single standpoint of convenience and ease of administration.

A special "cracking" process brings you an antitoxin which is almost a pure solution of anti-bodies . . . free from a large part of the reaction producing fraction of the serum.

RECENT ADVANCES IN THE SCIENCE OF NUTRITION

I. THE ROLE OF RIBOFLAVIN IN HUMAN NUTRITION

● In 1933, a series of articles on the vitamins was published, each article written by an authority in the field of nutrition. These papers served to summarize existing knowledge concerning these essential factors. During 1938 a similar series of articles has been issued. Comparison of related papers in these two series will indicate the most important advances in the science of nutrition which have been made in the course of the past five or six years.

In the first series of articles mentioned above, only two of the better known members of the old vitamin B complex received extended discussion (1). The more recent series, however, is characterized by the inclusion of a number of papers on riboflavin which, since 1932, has assumed a new significance in human nutrition (2). As compared with other factors with which it is often associated in nature, the rise of riboflavin to importance in human nutrition is somewhat anomalous.

For example, the effects upon humans of severe dietary deprivation of vitamin B_1 and the P-P factor are well known, in fact, such effects in themselves afford proof of the indispensable nature of these factors. While riboflavin is apparently concerned in cellular oxidation processes of mammals, the specific effect on humans of riboflavin deficiency is not known. Nevertheless, from the weight of evidence accumulated during the last five years, riboflavin is generally accepted as important in human nutrition. Authoritative opinion concerning riboflavin has been succinctly expressed as follows:

> "The fact that we do not know any specific human disease due to shortage of riboflavin is entirely compatible with the view that this substance is important in human nutrition. A detailed discussion of reasons for believing that riboflavin plays a role in the life process of the human as of other species would probably seem superfluous to a majority of readers at this date, and to a still larger majority in the future. Suffice it to point out that our species has evolved in the direction not of shortening the list of things it needs but of lengthening the list of things it can use to advantage." (2c)

Chemically, riboflavin is described as 6, 7 dimethyl-9 (d-l' ribityl) iso-alloxazine; a yellow-green, heat-stable pigment enjoying wide distribution in the plant and animal kingdoms. Many foods, therefore, of both plant and animal origin supply valuable amounts of this essential factor, specifically, fruits, vegetables, particularly the leafy pigmented types, and animal products such as milk and dairy products, meats, liver, and fish. It may, perhaps, be too early to estimate the daily human requirement for riboflavin. However, one rather liberal recommendation lists 600 units* as required daily by older children and adults; the estimated riboflavin requirement for younger children is somewhat less (2c).

In view of the above facts, attainment of an adequate intake of riboflavin would appear to be best insured by a varied dietary regime which includes the so-called "protective" foods. In the formulation of such diets, commercially canned foods may be particularly valuable. The older "vitamin G" assays —which are now known to measure principally the riboflavin contents of foods—indicate that modern canning procedures are without significant effect upon riboflavin. In addition, many foods valued for their contribution of this factor are canned commercially and hence are conveniently available at all seasons on practically every American market. Therefore commercially canned foods may be freely used in arranging such protective diets and they should materially assist in providing an adequate supply of this newly recognized dietary essential, riboflavin.

This is the fortieth in a series of monthly articles, which summarize, for your convenience, the conclusions about canned foods reached by authorities in nutritional research. We want to make this series valuable to you, so we ask your help. Will you tell us on a post card addressed to the American Can Company, New York, N. Y., what phases of canned foods knowledge are of greatest interest to you? Your suggestions will determine the subject matter of future articles.

The Seal of Acceptance denotes that the statements in this advertisement are acceptable to the Council on Foods of the American Medical Association.

Officers of the California Medical Association

General Officers

President—William W. Roblee, 202 Mission Inn Rotunda, Riverside.

President-Elect—Charles A. Dukes, 601 Wakefield Building, 426 Seventeenth Street, Oakland.

Speaker of House of Delegates—Lowell S. Goin, 414 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.

Vice-Speaker of House of Delegates—John H. Graves, 977 Valencia Street, San Francisco.

Chairman of Council—Karl L. Schaupp, 490 Post Street, San Francisco.

Vice-Chairman—Junius B. Harris, Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Chairman of Executive Committee—T. Henshaw Kelly, 830 Medico-Dental Building, 490 Post Street, San Francisco.

Chairman of the Committee on Public Relations—George G. Reinle, 532 Fifteenth Street, Oakland.

Past President—Howard Morrow, 384 Post Street, San Francisco.

Secretary-Treasurer—George H. Kress, 450 Sutter Street, Room 2004, San Francisco. Telephone DOuglas 0062.

Editor—George H. Kress, 450 Sutter Street, Room 2004, San Francisco.

General Counsel—Hartley F. Peart, Room 1800, 111 Sutter Street, San Francisco.

Associate General Counsel—Hubert T. Morrow, Van Nuys Building, 210 West Seventh Street, Los Angeles.

Councilors

(In addition to the elected district and at-large Councilors, the Council has as ex officio members, the general officers and the Chairman of the Committee on Public Relations. Chairman of Council, Karl L. Schaupp; Secretary, George H. Kress.)

District Councilors

First District—Imperial, Orange, Riverside, San Bernardino and San Diego Counties, Calvert L. Emmons (1941), 206 Emmons Building, Ontario.

Second District—Los Angeles County, Carl R. Howson (1939), 1114 Wilshire Medical Bldg., 1930 Wilshire Boulevard, Los Angeles.

Third District—Kern, San Luis Obispo, Santa Barbara and Ventura Counties, Louis A. Packard (1940), 563 Haberfelde Building, Bakersfield.

Fourth District—Calaveras, Fresno, Inyo, Kings, Madera, Mariposa, Merced, Mono, San Joaquin, Stanislaus, Tulare and Tuolumne Counties, Axcel E. Anderson (1941), Medical Group Building, 1759 Fulton Street, Fresno.

Fifth District—Monterey, San Benito, San Mateo, Santa Clara and Santa Cruz Counties, Alfred L. Phillips (1939), Farmers and Merchants Bank Building, Santa Cruz.

Sixth District—San Francisco County, Karl L. Schaupp (1940), 530 Medico-Dental Building, 490 Post Street, San Francisco.

Seventh District—Alameda and Contra Costa Counties, Oliver D. Hamlin (1941), 389 Thirtieth Street, Oakland.

Eighth District—Alpine, Amador, Butte, Colusa, El Dorado, Glenn, Lassen, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Sutter, Tehama, Yolo, and Yuba Counties, Frederick N. Scatena (1939), Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Ninth District—Del Norte, Humboldt, Lake, Marin, Mendocino, Napa, Siskiyou, Solano, Sonoma and Trinity Counties, Henry S. Rogers (1940), Petaluma.

Councilors-at-Large

Harry H. Wilson (1941), 1919 Wilshire Boulevard, Los Angeles.

C. O. Tanner (1939), 3255 Fourth Street, San Diego.

William H. Kiger (1940), 911 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.

Philip K. Gilman (1941), 2000 Van Ness Avenue, San Francisco.

T. Henshaw Kelly (1939), 830 Medico-Dental Building, 490 Post Street, San Francisco.

Junius B. Harris (1940), Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Standing Committees

Executive Committee

The President, the President-elect, the Speaker of the House of Delegates, the Chairman of the Council, the Chairman of the Auditing Committee, the Chairman of the Committee on Public Relations, the Past President, the Secretary-Treasurer, and the Editor. (T. Henshaw Kelly, chairman; George H. Kress, secretary.)

Auditing Committee

O. D. Hamlin	Oakland	1939
T. Henshaw Kelly (Chairman)	San Francisco	1939
Philip K. Gilman	San Francisco	1939

Members of the Auditing Committee are appointed each year by the Chairman of the Council.

Committee on Associated Societies and Technical Groups

William H. Geistweit	San Diego	1939
John V. Barrow (Chairman)	Los Angeles	1940
Edwin L. Bruck	San Francisco	1941

Committee on Health and Public Instruction

W. R. P. Clark	San Francisco	1939
Benjamin W. Black	Oakland	1940
Fred B. Clarke (Chairman)	Long Beach	1941

Committee on History and Obituaries

J. Marion Read	San Francisco	1939
A. Elmer Belt	Los Angeles	1940
Frank R. Makinson (Chairman)	Oakland	1941
Secretary ex officio		
Editor ex officio		

Committee on Hospitals, Dispensaries and Clinics

W. Earl Mitchell (Chairman)	Oakland	1939
Karl L. Schaupp	San Francisco	1940
George Dawson	Napa	1941

Committee on Industrial Practice

Philip Stephens (Chairman)	Los Angeles	1939
Harry E. Zaiser	Orange	1940
Morton R. Gibbons	San Francisco	1941

Committee on Medical Defense

Fred R. De Lappe	Modesto	1939
John P. Nuttall	Santa Monica	1940
George G. Reinle (Chairman)	Oakland	1941

Committee on Medical Economics

William R. Molony, Sr.	Los Angeles	1939
Edward M. Pallette	Los Angeles	1940
John H. Graves (Chairman)	San Francisco	1941

Committee on Medical Education and Medical Institutions

Loren R. Chandler (Chairman)	San Francisco	1939
John B. Doyle	Los Angeles	1940
B. O. Raulston	Los Angeles	1941

Committee on Membership and Organization

Dewey R. Powell	Stockton	1939
G. Dan Delprat	San Francisco	1940
George D. Maner (Chairman)	Los Angeles	1941

Committee on Postgraduate Activities

F. F. Gundrum	Sacramento	1939
John C. Ruddock (Chairman)	Los Angeles	1940
F. E. Clough	San Bernardino	1941
Secretary ex officio		

Committee on Publications

Oscar Reiss	Los Angeles	1939
Ralph Eusden (Chairman)	Los Angeles	1940
Ruggles A. Cushman	Talmage	1941
Secretary ex officio		
Editor ex officio		

Committee on Public Policy and Legislation

T. Henshaw Kelly	San Francisco	1939
E. T. Remmen	Glendale	1940
Junius B. Harris (Chairman)	Sacramento	1941
President ex officio		
President-elect ex officio		

Committee on Scientific Work

F. M. Pottenger	Monrovia	1939
Lemuel P. Adams	Oakland	1940
J. Homer Woolsey	Woodland	1941

William H. Barrow, Secretary of Section on General Medicine, ex officio

Ray B. McCarty, Secretary of Section on General Surgery, ex officio

George H. Kress (Chairman), ex officio.

Committee on Public Relations

The Committee on Public Relations consists of the chairmen of the following standing committees and of certain general officers of the Association, all serving ex officio. The chairman of the committee is George G. Reinle, the secretary is George H. Kress. The director of the Department of Public Relations is George H. Kress. The chairman of the Committee on Public Relations is ex officio a member of the Council.

Fred B. Clarke.....Chair., Com. on Health and Public Instruction
W. Earl Mitchell.....Chair., Com. on Hospitals, Dispensaries, Clinics
Philip Stephens.....Chair., Com. on Industrial Practice
George G. Reinle.....Chair., Com. on Medical Defense
George D. Maner....Chair., Com. on Membership and Organization
John H. Graves.....Chair., Com. on Medical Economics
Junius B. Harris.....Chair., Com. on Public Policy and Legislation
Alson R. Kilgore.....Chair., Cancer Commission
John C. Ruddock.....Chair., Com. on Postgraduate Activities
William W. Roblee.....President of California Medical Association
Charles A. Dukes.....President-elect
George H. Kress.....Secretary-Treasurer

Communications for the Public Relations Department should be addressed to the Director, George H. Kress, M. D., Room 2004, 450 Sutter Street, San Francisco.

Cancer Commission

Alson R. Kilgore (Chairman)	San Francisco	1939
Henry J. Ullmann	Santa Barbara	1939
Clarence G. Toland	Los Angeles	1939
Charles A. Dukes	Oakland	1940
Lyell C. Kinney (Vice-Chairman)	San Diego	1940
Otto H. Pflueger (Secretary)	San Francisco	1940
Orville Meland (Sec'y for Southern Section)	Los Angeles	1941
A. Herman Zeiler	Los Angeles	1941
Gertrude Moore	Oakland	1941

Communications for the Cancer Commission should be addressed to the Secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

(Roster lists of officers of scientific section, component county societies, Woman's Auxiliary, A. M. A. delegates, special committees, etc., are continued on advertising pages 4 and 6.)

ISOPHRIN

TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is 1/4% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel Laboratories.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

Rates, Information and Booklet on Request

ROSTER OF COUNTY MEDICAL SOCIETIES, CALIFORNIA MEDICAL ASSOCIATION

(County society secretaries are requested to promptly notify "California and Western Medicine" when changes are indicated in their roster information.)

Alameda County Medical Association
2404 Broadway, Oakland
President, Clarence A. DePuy, 230 Grand Avenue, Oakland.
Secretary, Gertrude Moore, 2404 Broadway, Oakland.
Meeting, *Third Monday, 8:15 p. m., Hunter Hall, Oakland.*

Butte County Medical Society
President, Raymond Kilduff, 322½ Meyers Street, Oroville.
Secretary, J. O. Chiapella, 131 Broadway, Chico.
Meeting, *Second Thursday.*

Contra Costa County Medical Society
President, Selby H. Marks, Grabstein Bldg., Pittsburg.
Secretary, Thomas J. Dozier, 202 G Street, Antioch.
Meeting, *Second Tuesday, 8 p. m.*

Fresno County Medical Society
President, Henry A. Randel, Box 2308, Fresno.
Secretary, Lester R. Nielson, 1006 Mattei Bldg., Fresno.
Meeting, *First Tuesday, University-Sequoia Club, Fresno.*

Humboldt County Medical Society
President, Francis M. Stump, Crescent City.
Secretary, Lawrence A. Wing, Fifth and F Streets, Eureka.
Meeting, *First Thursday.*

Imperial County Medical Society
President, Henry B. Graeser, 115 E. Fifth Street, Holtville.
Secretary, William A. Clarke, Holtville.
Meeting, *Third Tuesday, 7 p. m., Barbara Worth Hotel, El Centro.*

Kern County Medical Society
President, Harry W. Lange, Hopkins Bldg., Bakersfield.
Secretary, C. S. Compton, 428 C Street, Bakersfield.
Meeting, *Third Thursday, 8:30 p. m.*

Kings County Medical Society
President, P. K. Edmunds, Corcoran.
Secretary, William A. Johnstone, Hanford.
Meeting, *Second Monday, 8 p.m., Legion Hall, Hanford.*

Lassen-Plumas-Modoc County Medical Society
President, C. I. Burnett, Susanville.
Secretary, Fred J. Davis, Jr., Westwood.
Meeting, *On Call.*

Los Angeles County Medical Association
1925 Wilshire Boulevard, Los Angeles
President, Ralph B. Eusden, M. D., 412 Professional Bldg., 117 East 8th St., Long Beach.
Secretary, George D. Maner, 1925 Wilshire Boulevard, Los Angeles.
Meetings, *First and Third Thursdays, 1925 Wilshire Boulevard, Los Angeles.*

Marin County Medical Society
President, W. Scott Polland, Albert Building, San Rafael.
Secretary, Carl W. Clark, 510 B Street, San Rafael.
Meeting, *Fourth Thursday, 6:30 p. m., Marin Golf and Country Club.*

Mendocino-Lake County Medical Society
President, Charles A. Craig, Lakeport.
Secretary, Robert B. Smalley, Willits.
Meeting, *On Call.*

Merced County Medical Society
President, E. M. Soderstrom, Merced.
Secretary, Fred O. Lien, Shaffer Bulding, Merced.
Meeting, *Third Thursday, Hotel Tioga, Merced.*

Monterey County Medical Society
President, Curtis B. Gorham, 215 Franklin Street, Monterey.
Secretary, Harold R. Lusignan, 215 Franklin Street, Monterey.
Meeting, *First Thursday.*

Napa County Medical Society
President, Walter Rapaport, Imola.
Secretary, M. M. Booth, Bruck Building, St. Helena.
Meeting, *First Wednesday.*

Orange County Medical Society
President, G. Wendell Olson, 211 No. Pomona St., Fullerton.
Secretary, Glenn Curtis, 323 So. Pomona Street, Brea.
Meeting, *First Tuesday, 8 p. m., Chapel of the Orange County Hospital, Orange.*

Placer County Medical Society
President, C. Ettrick Lewis, 59 Lincoln Ave., Auburn.
Secretary, Robert A. Peers, Colfax.
Meeting, *At Call of President.*

Riverside County Medical Society
President, D. D. Roos, Corona.
Secretary, Thomas A. Card, 3616 Main Street, Riverside.
Meeting, *Second Monday, 8 p. m., Library, Riverside Community Hospital.*

Sacramento Society for Medical Improvement
President, Dave Dozier, California State Life Building, Sacramento.
Secretary, Glenn E. Millar, 321 Physicians Building, Sacramento.
Meeting, *Third Tuesday, 8:30 p. m., Auditorium, Sacramento.*

San Benito County Medical Society
President, J. M. O'Donnell, Hollister.
Secretary, L. E. Smith, Hollister.
Meeting, *At Call of President.*

San Bernardino County Medical Society
President, Delbert B. Williams, 401 North Eighth Street, Colton.
Secretary, A. E. Varden, Medico-Dental Building, San Bernardino.
Meeting, *First Tuesday, 8 p. m., San Bernardino County Charity Hospital.*

San Diego County Medical Society
Fourteenth Floor, Medico-Dental Building, 233 A Street, San Diego
President, Bryant R. Simpson, 1205 Medico-Dental Building, San Diego.
Secretary, W. H. Newman, Medico-Dental Building, San Diego.
Meeting, *Second Tuesday, El Cortez Hotel.*

San Francisco County Medical Society
2180 Washington Street, San Francisco
President, William C. Voorsanger, 490 Post St., San Francisco.
Secretary, Stanley H. Mentzer, 2180 Washington Street, San Francisco.
Meetings, *Every Tuesday, 8:15 p. m., 2180 Washington Street, San Francisco.*

San Joaquin County Medical Society
President, A. C. Boehmer, Box 306, Lodi.
Secretary, George H. Rohrbacher, Medico-Dental Building, Stockton.
Meeting, *First Thursday, 8:15 p. m., Medico-Dental Club Rooms, Stockton.*

San Luis Obispo County Medical Society
President, Frederick R. Mugler, 1170 Marsh Street, San Luis Obispo.
Secretary, E. D. Anderson, 1120 Morro Street, San Luis Obispo.
Meeting, *Third Saturday, 6:30 p. m., Mulholland's Grill, San Luis Obispo.*

(Roster lists continued on advertising page 6)

San Mateo County Medical Society
President, Hartzell H. Ray, 23 Second Avenue, San Mateo.
Secretary, J. Garwood Bridgman, 205 Third Avenue, San Mateo.
Meeting, *Fourth Wednesday, Benjamin Franklin Hotel, San Mateo.*

Santa Barbara County Medical Society
President, E. J. Lamb, 1515 State Street, Santa Barbara.
Secretary, J. Jerome Rupp, 16 E. Junipero Street, Santa Barbara.
Meeting, *Second Monday, Cottage Hospital.*

Santa Clara County Medical Society
President, E. O. G. Schmitt, 608 Medico Dental Bldg., San Jose.
Secretary, Leslie B. Magoon, Medico-Dental Building, San Jose.
Meeting, *Third Wednesday, 8 p. m., Medico-Dental Building, San Jose.*

Santa Cruz County Medical Society
President, Dean S. Woodard, Stoesser Bldg., Watsonville.
Secretary, Samuel B. Randall, 84 Walnut Avenue, Santa Cruz.
Meeting, *First Monday, 7:30 p. m., Club Rio del Mar, Aptos.*

Shasta Connty Medical Society
President, Mathew D. Pratt, Fall River Mills.
Secretary, Morton J. Murphy, Shasta County Hospital, Redding.
Meeting, *Second Monday.*

Siskiyou County Medical Society
President, J. B. McGuire, Mt. Shasta.
Secretary, Victor W. Hart, 113 No. Oregon Street, Yreka.
Meeting, *Second Sunday.*

Solano County Medical Society
President, Ream S. Leachman, 727 Sonoma St., Vallejo.
Secretary, John W. Green, Box 539, Vallejo.
Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society
President, Alfred A. Thurlow, 505 B St., Santa Rosa.
Secretary, C. M. Carlson, 534 B Street, Santa Rosa.
Meeting, *Second Thursday.*

Stanislaus County Medical Society
President, Joseph L. Azevedo, Jr., 1024 "J" Street, Modesto.
Secretary, Hoyt R. Gant, 401 Beaty Building, Modesto.
Meeting, *Second Friday.*

Tehama County Medical Society
President, Donald E. Thompson, Red Bluff
Secretary, F. J. Bailey, Red Bluff.
Meeting, *At Call of President.*

Tulare County Medical Society
President, E. R. Zumwalt, Tulare.
Secretary, Karl F. Weiss, Security First National Bank Building, Visalia.
Meeting, *Sunday Evening once a month.*

Ventura County Medical Society
President, Grundy C. Coffey, Bank of America Building, Ventura.
Secretary, A. A. Morrison, 625 Main Street, Santa Paula.
Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society
President, Charles S. Roller, Woodland Clinic, Woodland.
Secretary, W. J. Blevins, Jr., Woodland.
Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society
President, Neal M. Loomis, Yuba City.
Secretary, Fred W. Didier, Wheatland.
Meeting, *Second Tuesday.*

In Head Colds And Hay Fever

CONVENIENT AND EFFECTIVE TREATMENT

THE instillation of nose drops is most effective when the patient is reclining with head thrown back. Yet how many of your patients will take the trouble—or, indeed, have the opportunity during the day—to administer nose drops in this manner?

On the other hand, 'Benzedrine Inhaler' is volatile. Its vasoconstrictive vapor diffuses throughout the rhinological tract. Consequently no uncomfortable or awkward positions are necessary for its correct administration.

Each tube is packed with benzyl methyl carbinamine, S.K.F., 0.325 gm.; oil of lavender, 0.097 gm.; menthol, 0.032 gm. 'Benzedrine' is the registered trademark for S.K.F.'s nasal inhaler and for their brand of the substance whose descriptive name is benzyl methyl carbinamine.

FOR SUSTAINED BISMUTH EFFECT USE

Iodobismitol with Saligenin

Urinary excretion of bismuth after multiple injections of Iodobismitol. Arrows indicate injections

ACCORDING to the Council on Pharmacy and Chemistry—"Probably those compounds of bismuth will have the best spirocheticidal effect that are able to keep the therapeutic level of bismuth at such a continuous height that it will be reflected in the urine with a level of 0.002 Gm. or more of metallic bismuth per day."

That Iodobismitol with Saligenin meets this requirement was shown by a recent clinical study.[1] Two-cc. doses of Iodobismitol with Saligenin were given twice weekly for three weeks. The charts illustrated above show the urinary excretion over a period of four weeks—49% of the bismuth having been excreted. Iodobismitol with Saligenin was the only preparation so studied capable of maintaining a therapeutically active concentration of bismuth in the blood stream as manifested by a constant urinary excretion equivalent to or in excess of 0.002 Gm. daily.

Iodobismitol with Saligenin may be used alone or with the arsenicals in both early and late syphilis. It presents bismuth largely in anionic (electro-negative) form. It is a propylene glycol solution containing 6% sodium iodobismuthite, 12% sodium iodide, and 4% saligenin (a local anesthetic).

SQUIBB ARSENICALS

Neoarsphenamine Squibb, Arsphenamine Squibb, and Sulpharsphenamine Squibb are prepared to produce maximum therapeutic benefit. They are subjected to exacting controls to assure a high margin of safety, uniform strength, ready solubility, and high spirocheticidal activity.

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY—FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

THE NEW YORK POLYCLINIC

MEDICAL SCHOOL AND HOSPITAL

(Organized 1881)

(The Pioneer Post-Graduate Medical Institution in America)

FOR THE

GENERAL PRACTITIONER

Intensive full-time instruction in those subjects which are of particular interest to the physician in general practice. The course covers all branches of Medicine and Surgery.

ROENTGENOLOGY

An intensive course, with a minimum of ten hours a week devoted to lectures and demonstrations on film interpretation, fluoroscopy and technique. The department is open daily from 9 a. m. to 5 p. m. Matriculants are extended the opportunity to attend in the department during radiographic and fluoroscopic examinations.

PHYSICIANS' AND SURGEONS' TELEPHONE EXCHANGE • NURSES' BUREAU

"Is This Product Council-Accepted?"—This is the first question many physicians ask the detail man when a new product is presented.

If the detail man answers "No," the doctor saves time by saying, "Come around again when the Council accepts your product."

If the detail man answers "Yes," the doctor knows that the composition of the product has been carefully verified and that members of the Council have scrutinized the label, weighed the evidence, checked the claims, and agreed that the product merits the confidence of the physicians. The doctor can ask his own questions and make his own decision about using the product, but not only has he saved himself a vast amount of time, but he has derived the benefit of a fearless, expert, fact-finding body, whose sole function is to protect him and his patient.

No one physician, even if he were qualified, could afford to devote so much time and study to every new product. His Council renders this service for him freely. Nowhere else in the world is there a group that performs the function so ably served by the Council on Pharmacy and Chemistry and the Council on Foods.

Mead Johnson & Company coöperates with both Councils, not because we have to, but because we want to. Our detail men can always answer you, "Yes, this Mead product *is* Council-accepted."

The Red Tape Begins to Unwind!—If anyone is in doubt as to what happens under state medicine, the following example should be convincing: In the case of a woman in the State of New York who was ill, attention was given by a local physician, who then notified the relief official that prolonged medical care would be required. The case supervisor for the public welfare official then sent the following letter:

"We are enclosing forms which are to be forwarded to the state department where prolonged medical care is needed.

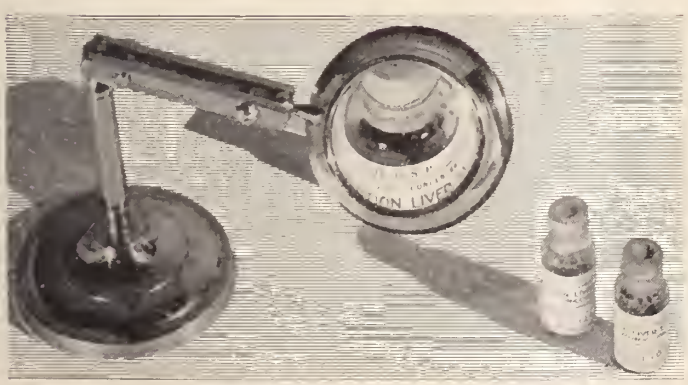
"We are asked to send a letter from the doctor with these forms giving a complete medical history of the patient which will include the date of onset of illness, the diagnostic procedure used and any laboratory findings. *The name, strength, and quantity of the material used for injections will be reviewed by a state physician.*"

The red tape begins to unwind and before the spool runs out all of medical practice may be wrapped in its meshes.—*Journal of the American Medical Association,* August 13, 1938.

It seems an inseparable accompaniment of the advancement of knowledge that things once thought to be units turn out to be composites: the magic prism of investigation is always splitting up apparent entities into an ever-increasing number of new elements.—E. O. Jordan.

High U.S.P. Unitage!

15 U. S. P. Units per cc. in



1 cc. Concentrated Solution Liver Extract
(PARENTERAL)

Lederle

THIS CAREFULLY MADE, THOROUGHLY TESTED CONCENTRATE produces a rapid regeneration of red blood cells and hemoglobin in Addisonian pernicious anemia and the primary anemia of sprue.

The high content of active material requires fewer injections for adequate maintenance—intervals of 10 to 15 or more days. The increased refinement (freedom from inert, irritant substances) causes a minimum of discomfort at the time of injection.

Since it is now generally recognized that the successful treatment of neurologic involvements (central nervous system) requires much more active material than is necessary to maintain an essentially normal blood, "1 CC. CONCENTRATED SOLUTION LIVER EXTRACT *Lederle*" provides an easy means of increasing dosage—still with a relatively small volume of extract and a minimum of inconvenience.

Can Whooping Cough Be Controlled?*—In the extremely rapid advance made by the medical profession against communicable diseases since the beginning of the present century, whooping cough has proved most intractable. Typhoid, diphtheria, measles, and scarlet fever have all been brought under partial control. For example, the death rate from diphtheria in 1900 to 1904* was 32.8 per 100,000; today the corresponding rate is 2. There has been a decline in the death rate from whooping cough, but nothing comparable to the success in combating diphtheria. Whereas diphtheria formerly had a death rate three times that of whooping cough, the ratio for the period 1931-1935 was three deaths from whooping cough (nine out of every ten deaths charged to whooping cough are due to complicating bronchopneumonia) to two from diphtheria.*

Until recently physicians have lacked in whooping cough the specific prophylactic and therapeutic measures which have enabled them to control other communicable diseases. Prophylactic immunization and specific antitoxin therapy have all but mastered diphtheria. Also, in typhoid fever, smallpox, scarlet fever, etc., specific prophylactic or therapeutic measures are available. In whooping cough prophylactic measures of promise were lacking until Dr. Louis W. Sauer in 1934 made known his studies with a special pertussis vaccine which now bears his name.

In 1936 the incidence and death rate of whooping cough hit new lows. Some idea of the improvement is obtained from a comparison of statistics for the years 1930-1936. From 1930 to 1935, inclusive, there were 1,179,029 reported cases of whooping cough in the United States, with 30,958 deaths; stated differently, one case of every thirty-eight reported terminated fatally. In 1936 there were 147,237 cases, with 2,583 deaths—a fatality rate of one per fifty-eight reported cases. Complete statistics for 1937 are not yet available, but data furnished by twenty-nine states and the District of Columbia indicate that the decrease in mortality rate will be maintained.

ACCEPTABLE TO FASTIDIOUS PATIENTS

NEO-SILVOL

Neo-Silvol (Colloidal Silver Iodide Compound) is particularly suited for use in eye, ear, nose and throat. It is antiseptic in action and has the added advantages of being non-staining and non-irritating. Even in 25 to 50 per cent solution Neo-Silvol will not injure delicate mucous membranes.

Ten to twenty per cent solutions of Neo-Silvol are suitable for most eye infections; gonorrheal ophthalmia may call for stronger solutions—25 to 50 per cent. In inflammatory conditions of the nose, naso-pharynx, pharnynx and tonsils, Neo-Silvol (10 to 25 per cent strength) may be sprayed or swabbed on the involved areas three or four times daily. Neo-Silvol solutions are easily prepared by dissolving the glistening, cream-colored granules in water.

•

Supplied in six-grain capsules, packages of 50 and 500, and in 1-ounce and 1/4-pound bottles.

PARKE, DAVIS & COMPANY, DETROIT • *The World's Largest Makers of Pharmaceutical and Biological Products*

An early Mulford Smallpox Vaccine package

40 *years in the development of* SMALLPOX VACCINE

The modern Mulford Smallpox Vaccine Tube-Point

Since 1898, when Smallpox Vaccine Mulford was first introduced by the Mulford Biological Laboratories, vaccine for millions upon millions of vaccinations has been provided the medical profession for their constant battle against this disease.

During these forty years there has been constant progress in product and package—from the technic of scab vaccination, through the old-fashioned dry ivory points, dry glass points, glycerinized glass points, to the Mulford Improved Capillary Tube-Point, a sterile, sealed vaccine container and inoculating instrument all in one, ready for immediate use with any of the approved technics—multiple pressure, puncture or scratch.

Smallpox Vaccine Mulford is subjected to exhaustive tests which assure its potency and purity before release. For this reason it produces a high percentage of successful vaccinations in non-immune individuals.

Smallpox Vaccine Mulford is supplied in these convenient packages: Capillary Tubes, 5's and 10's, and Improved Capillary Tube-Points, singles and 5's.

composed of those who are afraid of the epithet "old fogy," and the other of those who are not. . . .

Unfortunately, things are not so simple as all this reasoning, and the Wassermann reaction has come to stay until supplanted by a better one; and though an experienced syphilologist may not need it so often as various laboratory owners think he does, he needs it very badly when he does. . . .

From an Original Article on "Chronic Intestinal Amebiasis, Without Dysentery" by R. S. Cummings, M. D., Los Angeles.—My excuses for reporting the following cases are, first, the scarcity of literature concerning amebic in-

(Continued on Page 18)

Are You Sure?

In some cases you probably prescribe two to three teaspoons of cod liver oil daily as an antirachitic for infants six months of age or older. . . . But **are you sure** that the baby actually receives the cod liver oil? Do you not find that all too often the mother neglects this daily task, or the baby refuses to take the dosage?

In prescribing Special Morning Milk you are assured that when the full tall can (13 fluid ounces) is included in the twenty-four hour formula (and this usually is the case for infants six months of age and older) the baby is receiving at least 1¼ teaspoons of cod liver oil equivalent in Vitamin D. The "daily battle" of forcing cod liver oil upon the child is eliminated. Furthermore, Special Morning Milk is available at all leading retail grocers at no extra cost over other evaporated milks having a lesser amount of added vitamin D.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA AUTHORIZED BY THE AMERICAN MEDICAL ASSOCIATION TO MAKE THE CLAIM THAT THE AMOUNT OF VITAMIN D ADDED IS GREATER THAN THAT USUALLY REQUIRED FOR THE PREVENTION OF RICKETS IN NORMAL INFANTS AND THUS THAT A MARGIN OF SAFETY IS OFFERED WHEN TAKEN IN THE QUANTITIES CUSTOMARILY PRESCRIBED BY THE PHYSICIAN.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA USING COD LIVER OIL CONCENTRATE AS ITS SOURCE OF VITAMIN D.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA CONTAINING 400 U.S.P. UNITS OF ADDED VITAMIN D PER TALL (13 fluid ounces) CAN OR ANY ADDED VITAMIN A. (2000 U.S.P. UNITS VITAMIN A ADDED TO EACH TALL CAN.)

No Cod Liver Oil taste in the Milk!

fections without dysentery, and second, to add my testimony to the efficacy of ipecac to rid the colon of amebas. . . .

From an Original Article on "The Cutaneous Reaction of Syphilis—(Luetin Reaction)" by Julian Mast Wolfsohn, M. D., San Francisco.—Syphilis, because of its poly morphous lesions, is one of the most difficult of diseases to accurately diagnose. In its latter stages it not only simulates other diseases, but in certain cases no demonstrable lesions or physical signs can be found to aid us in making a diagnosis. In primary and secondary syphilis the Treponema pallida can in most cases be demonstrated microscopically; so that our chief interest in this paper centers itself about the later stages of the disease, where laboratory methods must needs be often employed to ascertain the presence or absence of syphilis.

Since the advent of the Wassermann reaction, a great many cases of syphilis have been correctly diagnosed which otherwise would have been relegated to the collection of medical enigmas. How many cases of gummata of the brain or meninges have been saved from needless operation by this laboratory reaction! . . .

From an Original Article on "Enteroclysis in the Treatment of Weak Hearts" by William Watt Kerr, M. D., San Francisco.—Allow me to preface the following remarks by the statement that I am not going to suggest the use of colon lavage in all cases of weak heart action, but only in those instances where there is good reason to believe that the feebleness of the myocardium may be induced or increased by absorption of toxins from the alimentary canal, and even then the treatment is not capable of universal application. . . .

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 248)

arrested in his office at 702 Market Street by Special Agent J. W. Williams, who declared Van Buren was practicing medicine without a license. . . ." (San Francisco *Examiner*, July 21, 1938.)

"A former physician, extradited here from Boston, Mass., on a spurious check charge, was being questioned in Los Angeles today in connection with crimes throughout the country spanning three decades. According to police, the suspect, Jerome Abramowitz, alias Thomas J. Luby, whose license to practice medicine has been canceled, has served two jail terms in the East for forgery and passport violations. They charged he is sought for questioning in connection with the passing of more than $100,000 in fictitious checks." (Press dispatch, dated Los Angeles, July 21, and printed in the San Francisco *Call-Bulletin*, July 21, 1938.)

"Dr. Nathan Housman occupied the witness stand in Superior Judge J. J. Trabucco's court yesterday and explained why John C. Farrell, his codefendant, paid him $5,000 for professional services to the late Lewis M. Baker. Doctor Housman, Egan case figure, and Farrell, former police officer acquitted with three fellow officers in an asserted drug-store robbery, are defendants in a suit brought by Mrs. Mignon Baker Brown, widow of Baker. . . . Baker, fatally injured in an automobile accident in 1936, had approximately $10,000 at the time of the accident. Return of this sum, which Baker gave to Farrell, is sought by the widow. 'Baker told Farrell to give me $5,000,' Housman testified yesterday. 'I left Baker's side during his illness only to get coffee, or change my clothes. He had the severest skull fracture I ever saw. If I'd known that I would work four days and nights without rest, I'd have demanded $10,000.' Later Dr. O. W. Jones, who performed

(Continued on Next Page)

CO-ORDINATION

When the success of a plan depends upon its perfect execution there must be strict co-ordination between the individuals involved.

No program of treatment can relieve the incidence of constipation unless the patient is willing to co-ordinate his efforts with those of the physician. That is why so many doctors prescribe Petrolagar for their patients. Its pleasant taste and gentle, consistent action are acceptable to the patient as well as to the physician.

Five types of Petrolagar provide a choice of medication to suit the individual case. Samples on request.

Petrolagar Laboratories, Inc. • Chicago, Ill.

Petrolagar . . . Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

Rental Charges of Oxygen Tents REDUCED

•

a delicate two-hour brain operation on Baker, testified: 'My fee was $500. That included the payment for the consultant work done by Dr. Howard Naffziger. Doctor Housman did no more than I did. This $500, Housman and Farrell claim, came out of the $5,000 given Housman by Farrell. A third witness was Nurse Mary A. Wilson, who said 'someone held Baker up in bed so he could sign a death-bed release,' which surrendered his funds to Farrell. . . ." (San Francisco *Examiner*, July 27, 1938.) (Previous entries, December, 1932; July, 1933; and January, 1937.)

"Charged with suspicion of grand theft in connection with the asserted inducing of a local physician to pay for his hospitalization, Clifford Robertson, former film-casting director, had been booked today at the county jail. Dr. Charles E. Futch, the complainant, charged Robertson told him he still had considerable back salary due from a major studio, according to Investigator Ned Keeler." (Los Angeles *Herald-Express*, August 5, 1938.)

"Fresno County officials today joined with District Attorney Roger Walch and Coroner Earl Northrop of Hanford in investigating the death of Mrs. Maxine Burke, 27, whose death in the Kings County Hospital, July 22, was attributed to complications following an illegal operation. . . ." (Fresno *Bee and Republican*, July 29, 1938.)

"Habeas corpus proceedings by which Mrs. Erol Ray Ward, forty-eight, sought to escape prosecution on a charge of performing an illegal operation, were balked yesterday afternoon when Superior Judge Edward J. Tyrrell denied her petition for a writ. Mrs. Ward, nurse for Dr. J. F. Shafer, 74, likewise under arrest, attacked the complaint through her attorneys. . . ." (Oakland *Tribune*, July 29, 1938.)

"Dr. J. E. Shafer, 74, for thirty-two years a practicing physician, was yesterday charged by the police with having performed a criminal operation on Mrs. Lee Etta Bruce, twenty, 1037 Elbert Street, Oakland, last Friday. Doctor Shafer denied the charge. . . . " (San Francisco *Chronicle*, July 27, 1938.)

"James L. Bates, Gridley chiropractor, was arrested this afternoon on a complaint charging him with performing a criminal operation on Mrs. Rachel Kersey, twenty-two, wife of a Gridley laborer. . . . Bates' arrest was ordered by Joe King, District Attorney, after Dr. L. A. Jacoby, county physician, had reported Mrs. Kersey to be in critical condition at the county infirmary. . . . Examination indicated she was suffering from blood poisoning following an operation to prevent her from becoming a mother, King said. Mrs. Kersey admitted she had been treated by Doctor Bates at his office in Gridley, according to the District Attorney. . . . Bates, whose age was given as about fifty-two, has practiced in Gridley about fifteen years. . . . Bail was fixed by Harry S. Hills, Justice of the Peace, at $1,250 cash or $2,500." (Oroville *News*, July 29, 1938.)

"Earl Louis Alexander, thirty-eight, Oakland hosiery salesman, today was arrested by G. J. Mohler, investigator

for District Attorney Dan F. Conway, on suspicion of practicing medicine without a license. Mohler said an asserted examination performed by Alexander on Helen Boyle, fifteen, of 560 Bond Street, on the representation that he was a doctor, led to Alexander's arrest. Mohler said Alexander admitted posing as a doctor and calling at the Arthur home, but denied certain phases of the alleged examination of the girl. Miss Boyle and her mother, Mrs. C. E. Arthur, told Mohler a man giving his name as Doctor Hemingway called to make a physical examination of the girl, following an advertisement Miss Boyle published in which she sought employment in the care of children. A man, who gave his name as Doctor Hemingway, later called. Mrs. Arthur said she became suspicious after the so-called Doctor Hemingway informed her a further examination would be required. Arthur obtained the license number of an automobile which was traced to Alexander. Mohler said the State Board of Medical Examiners and the Alameda County District Attorney's office assisted in the investigation. A charge of practicing medicine without license was filed against Alexander in Justice George DeWolf's court today by Joseph W. Williams, Special Agent for the State Board of Medical Examiners. . . ." (Fresno *Bee and Republican*, August 10, 1938.)

Nutley Solves "Common Drinking Glass" Evil.—Attention of the nation's health authorities centered on this cleaner-than-average city recently, as health officers of New Jersey heard a story that could be duplicated anywhere in America.

Presenting a report, for which his fellow health officers had waited eagerly since January, Mr. Richard V. Fellers emphasized that pathogenic organisms were recovered in nearly every estalishment examined. Mr. Fellers emphasized that the condition was in no sense the result of unusual negligence on the part of those establishments which coöperated in the survey, but rather was, in the light of similar tests made elsewhere, typical of public eating places throughout the United States.

"We were long ago justly concerned about the so-called 'common drinking cup,'" he said. "Yet today we must concede that conditions in some of our public eating and drinking establishments are equally if not more menacing. In my opinion, unsterilized drinking glasses are 'common drinking glasses,' and as such should likewise be banned."

The organisms recovered in all glasses examined, Mr. Fellers said, was Staphylococcus albus, one of the family of pus-forming organisms. Staphylococcus aureus and Staphylococcus citreus were found in many instances, he disclosed; while considerable numbers of Coli aerogenes, common intestinal organisms, were isolated in several samples. Other pathogenic bacteria recovered included Neisseria catarrhalis, Gaffkya tetragena, Streptococcus pyogenes and Streptococcus epidemicus, or septic sore throat "bug." Thousands of colonies were cultured from the rim of a single glass.

Temperatures of wash and rinse waters used in the places examined, he said, varied from 10 to 71 degrees centigrade; superheated steam, the only effective heat sterilizer, being impractical, particularly in summer. The survey consequently showed a marked relation between organisms recovered from swabs of glasses and those found in the wash and rinse waters.

Chemicals, the health officer pointed out, were often impractical, particularly in taverns and soda fountains, because the type of liquid contained in the glass precludes the use of chemicals or sufficient concentrations of soap. There remained, he said, only one practical way of obeying the statutes—now in force in forty-six states—requiring absolute sterilization. This method is by ultra-violet radiation, which long has been known to be bactericidal and can now be produced by a practical, economical unit.

The health officer learned that the new Westinghouse ultra-violet tube called the Sterilamp, did not generate heat, was in fact used in refrigerators; was inexpensive, requiring only about ten watts of energy; had a useful life of about four thousand hours, and was simple to operate.

At his request, the Westinghouse engineers installed a special glass-sterilizing machine for the tests. The same glasses that had previously shown an alarming bacterial count became from 92.8 per cent to 99.9 per cent sterile after a few seconds' exposure.

Mr. Fellers then demonstrated the simple apparatus, showing how its endless wire belt carried washed glasses under the 30-inch sterilamps shaped like neon tubes, and over three others, automatically stopping when a sufficient number of glasses reached the discharge end.

"The investigation," he concluded, "showed conclusively that a sterilizer using sterilamps as the sterilizing agent effectively reduces the bacterial contamination of drinking glasses, and that this form of sterilization is practical and adaptable to general use."

Every Product Exhaustively **TESTED!**

Physicians must have preparations the ingredients and efficacy of which are of unquestioned value. The steady growth of The Smith-Dorsey Company from 1908 is the best indication that our products measure up to these requirements.

PHARMACEUTICALS
YOU CAN PRESCRIBE WITH CONFIDENCE

Every Smith-Dorsey product is safeguarded in three ways:

1. We operate a control laboratory for the purpose of testing raw materials for purity.
2. Finished products are thoroughly tested for conformity to label statements.
3. No new products are released without subjecting them to physiological tests.

Our laboratory is modern and complete and is manned by competent university trained chemists. No expense is spared to make research complete. No preparations are ever offered the laity.

Such is the background of Smith-Dorsey products.

Why RY-KRISP is a natural corrective for *Common Constipation*

Doctors are finding Ry-Krisp Whole Rye Wafers a natural aid for correcting common constipation due to insufficient bulk for reasons which are obvious when you consider that...

RY-KRISP is simply whole rye, salt and water—*double baked* for brittle crispness. As such a food it has a high percentage of bran, high pentosan and crude fibre content to encourage normal bowel action. Moreover, each wafer absorbs five times its own weight in water, thus producing needed bulk to stimulate natural peristaltic action.

RY-KRISP involves no unpleasant dosage to be avoided or postponed. Instead it offers the tempting, crunchy goodness of a *natural,* delicious food—so good with any meal that patients gladly eat it regularly. Results are dependable, predictable, natural. For that reason alone it is immeasurably valuable to school children, to busy men and women tied down with daily routine.

For free samples and the Research Laboratory Report on Ry-Krisp use the coupon below.

Mr. Fellers, who was introduced by Mr. F. H. Bostock, Nutley's Commissioner of Public Affairs, and chairman of the symposium, was followed by Dr. Harvey C. Rentschler, Director of Research at the Westinghouse Lamp Laboratories, and Dr. Robert F. James, his associate, co-developers of the sterilamp. Doctor James told of other successful applications of the Rentschler-James process. Doctor Rentschler showed microphotographs of paramecia being killed by the sterilamp, which caused them to burst before the health officers' eyes.

Types of Pneumococci in Acute Pneumonia.—Gard and his associates point out that the type differentiation of the pneumococci has opened up fresh avenues of approach for the study of the epidemiology and therapy of the pneumococcic infections. The satisfactory experiences gained abroad with specific serum therapy have led to its being tried in Sweden. The aim of the researches reported in this paper has been to ascertain the importance of various types of pneumococci as a cause of pneumonia. The authors reach the conclusion that the sharp line of distinction between croupous lobar pneumonia and catarrhal bronchopneumonia cannot be maintained. Acute pneumonia presents varying pathologico-anatomic appearances ranging from the fibrinous, lobar form, passing gradually into catarrhal bronchopneumonia and showing intermediary and mixed forms with variations in regard to the abundance of fibrin and the lobar dispersion. The pathologico-anatomic diagnosis made on the basis of clinical and roentgenologic observations is, of course, of value in determining the prognosis, but its importance in that respect is enhanced if it is supplemented by a bacteriologic investigation, which moreover is absolutely essential as a preliminary to a specific therapy. The authors have not been able to confirm Gundel's theory that the pathologico-anatomic aspect of pneumonia is determined entirely by the serologic type of the pneumococci. Other

Cosmetics and Your Patient's Morale

THE DOCTOR IS OF NECESSITY A STUDENT OF LIFE. Each new patient presents a new study, a new problem. Psychology plays an important role in the course of treatment he prescribes. With some patients he must be frank to a point of harshness, with others he must be gentle and coaxing. The nature of the illness and, more particularly, the nature of the patient determine his attitude. He knows from experience the value of bolstering his patient's morale. As a student of psychology he knows that few things are more depressing to a woman than the fear that she is losing her charm, that when she no longer cares how she looks the chances are she has lost touch with a vital interest in life. And because he appreciates the importance of a sensible interest in personal appearance he quite rightly encourages his patients to look their best at all times. FINE COSMETICS appeal to that interest. That is why they deserve to be recommended by doctors who are, after all, greatly concerned with their patient's morale.

factors play at least as important a part in this respect. If, then, it is hardly justifiable from that point of view to ascribe any special position to types 1 and 2, nevertheless it cannot be denied that type 1 predominates in the frequency statistics in spite of the fact that several of the other types have proved to be capable of causing pneumonia with as high a rate of mortality or one even higher. Gundel's assumption that dissimilarities in the mechanism of infection (exogenous-autogenous infection) is the decisive factor in this respect can hardly be accepted as a satisfactory solution of the problem. From the investigations the authors have carried out it appears that approximately half of the lobar forms of pneumonia are caused by pneumococcus type 1, so that the production of type 1 serum for therapeutic use must be regarded as one of the most important means of reducing mortality from pneumonia. The next step would be to make serum against types 2 and 7. The experience gained abroad as to the effect of serum against these three types of pneumococci has been extremely favorable.—*Acta Medica Scandinavica.*

First Welded Hospital Built Without Noise in Fifty-eight Work Days.—Freed from the machine-gun rattle of the rivet hammer, the thirteen-story Woman's Hospital of Pittsburgh has risen silently during fifty-eight noiseless working days in the midst of the University of Pittsburgh's Medical Center. In fact, the 1,000 tons of steel for Pittsburgh's first arc welded building were joined to the new Presbyterian Hospital; less than two hundred feet away from the Eye and Ear Hospital and the Children's Hospital. The staccato beat of riveters was the last thing the physicians would prescribe for the hundreds of patients in these hospitals.

To meet the stipulation of the Woman's Hospital board of directors that the structure be welded together, City Council granted a special construction permit pending passage of a new ordinance incorporating welding regulations in the building code.

Electric Power Eliminates Rivets.—Ordinarily fifteen tons of rivets would have been pounded into the steel frame-

work, but the welders substituted $300 worth of electric power to merge 2,300 pounds of welding rods with the structural steel which was manufactured by the Bethlehem Steel Corporation. The Duquesne Light Company installed the power service for the Westinghouse transformer type arc welders, eliminating need for motor-driven or engine-driven direct current welding machines.

The inherent strength of the arc welds eliminated use of enough plates and connecting angles to equal the steel required for one additional floor. Arc welds form their own joints, juggling the steel molecules until they slide into a homogeneous mass.

Welded Columns Support Erection Derrick.—Putting the structural strength of welds to a titanic test, the builders used the welded columns and beams to support the largest steel erector's derrick ordinarily used on building construction, a 110-foot mast with a 100-foot boom, capable of hoisting six-ton loads in a single lift.

Stone and Webster Engineering Corporation, managing the construction, selected as the steel contractor the John L. Mullen Construction Company, erectors of the steel frame of the world's first multi-story alternating current arc welded structure, the new office building at the transformer works of the Westinghouse Electric & Manufacturing Company in Sharon, Pa. Incidentally, Westinghouse pioneered in the development of alternating current welding in the construction of its transformers and generators.

Safety Without Noise.—"There's no noise at all; that's the first paradox that impresses the builder using arc welding," commented Mr. Mulvehill, president of the Mullen concern. "At first, it doesn't seem possible that metal can tie itself together, but test after test have proved that the welded joints are as strong as the steel itself."

To insure a perfect structure, all welders were qualified by the Pittsburgh Testing Laboratory, which supervised tests under the American Welding Society Rules. Mr. Whiting, of the testing laboratory, supervised field tests and inspection on welds as they were applied on the building.

He reported: "We took samples of hundreds of welds and found them as permanent as the building itself."

When completed within the next year, the Woman's Hospital will be one of three in the entire country devoted exclusively to a study and treatment of diseases peculiar to women. In addition to the laboratories and therapeutic rooms, its six hospital floors will accommodate 150 patients.

Cancer.—Do you know that the average person is thirty years behind the times in his attitude toward cancer? That tens of thousands of women who have had cancer are now well, free from the disease, and living happy, useful lives? That perhaps more than half the 150,000 men and women who died last year of cancer might have been saved?—American Society for the Control of Cancer.

Do you know that two Presidents of the United States had this dread disease—U. S. Grant and Grover Cleveland—and that Cleveland, operated upon promptly, completely recovered from cancer and served again as President, having added fifteen healthful years to his life span, and that, like most people, Grant waited too long? The average cancer victim, records show, hesitates five or five and one-half months after he, himself, suspects, before consulting a physician. Grant waited four months; within a year after operation he was dead. Today, not only by surgery, but by x-ray and radium therapy, available in the private practice of the doctor and in hospitals, cancer victims are being freed from dread.—*Cincinnati Times-Star.*

Do you know that the Woman's Field Army for the Control of Cancer was formed to spread information and a message of hope, and that this is a woman's army because women are attacked most savagely in two locations—the breast and the uterus—and that cancer can be cured in more than 70 per cent of cases if taken in time? That the program of the Army must be a long-time one, as its object is to teach every man, woman, and child in the country that general cancer can be reduced only by courageous alertness and prompt action by the *individual*, and that this

THE POTTENGER SANATORIUM AND CLINIC
For Diseases of the Chest *Monrovia, California*
AN INSTITUTION FOR DIAGNOSIS AND THERAPY

CHOICE rooms and bungalows at rates ranging from $35 per week up, including medical service, general nursing, x-rays, routine laboratory examinations, ordinary medicines and therapeutic pneumothorax.

A few accommodations as low as $25 per week assigned on special application in selected cases.

In the foothills of the Sierra Madre Mountains, thirty-five miles from the ocean. Surrounded by beautiful gardens.

Close medical supervision. Aside from tuberculosis, special attention is given to asthma, bronchiectasis, lung abscess and kindred diseases.

For particulars address:

THE POTTENGER SANATORIUM AND CLINIC, Monrovia, California

can occur only when the danger signals of cancer are generally known and the delay between the appearance of these signs and a visit to a physician is reduced? That the Army will strive to interest men and women in all aspects of the disease, in the diagnosis and treatment, in the research and related problems that are being carried on, and also in the needs of underprivileged victims of the disease?

Whatever can be learned about the agents that initiate, direct, inhibit or destroy growth is of value in the attempt to control cancer by knowledge of its cause or causes. The field is as wide as the study of physical life itself, for cancer is a very real and assertive form of living tissue out of place in a body which is pledged to a rigidly organized and highly evolved limitation of function.

Recently, an Act of Congress established a National Cancer Institute. The Act directs the Surgeon-General of the Public Health Service to conduct, assist and foster researches, investigations, experiments and studies relating to the cause, prevention and methods of diagnosis and treatment of cancer. The Act provides for the purchase of radium and its loan to institutions studying and treating cancer. Fellowships are to be established for research purposes, and experts and consultants brought together for applying their combined knowledge and experience in combating different features of the disease. In our country there are organizations, groups, and even individual physicians engaged in cancer studies from new and original angles, but who lack funds to carry forward their researches to the extent desired. The Act provides for grants-in-aid to such qualified agencies so they may work out their ideas in the hope that someone, somewhere, may evolve a new fact or a new discovery which may throw light upon this great problem.

"A lasting service to preventive medicine can be performed by each physician who produces authoritative and logical certificates of cause of death, and time should be found in the curriculum of medical schools to impress the essential points upon each student."—*American Journal of Public Health.*

PROLONGING the average span of life is only one accomplishment of modern medical science. Greater comfort, economic sufficiency, and enjoyment from life have been won for many who formerly would have faced a hopeless future. Insulin for the diabetic and liver therapy for the patient with pernicious anemia are isolated but outstanding examples of man's conquest of disease.

'AMYTAL' (Iso-amyl Ethyl Barbituric Acid, Lilly) is a hypnotic well adapted for administration with analgesics. Thus in combination with acetylsalicylic acid or with codeine, 'Amytal' controls pain and induces restful sleep.

'Amytal' is supplied in 1/8-grain, 1/4-grain, 3/4-grain, and 1 1/2-grain tablets in bottles of 40 and 500.

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

REFORMS IN MEDICAL CARE: NATIONAL HEALTH CONFERENCE AFTERMATHS

National Health Conference, Washington, D. C.—The proceedings of the "National Health Conference," which met in Washington on July 18-20 and concerning which comment was made on page 105 of last month's issue of CALIFORNIA AND WESTERN MEDICINE, continue to receive much attention in the press. A public health program for which an expenditure of eight hundred million dollars was outlined is naturally a matter of importance.

* * *

"United States News" Prints Symposium: "Is Present Medical System Adequate?"*—An interesting series of opinions from physicians, social-service workers, labor organizations and other executives have appeared in the "Question of the Week" department of the *United States News,* for August 1, 8 and 15, the result of an effort by that journal to obtain authoritative views on the problems presented, when the following questions were put to a large number of delegates to the National Health Conference:

1. Is there need for reform in the system of medical care now available in this country?
2. If reform is needed, should it take the form of compulsory health insurance as a part of a Social Security system?
3. Or should any reform be based purely upon voluntary group insurance methods under control of the medical profession itself?
4. If voluntary group insurance is considered inadequate, would a tax-supported system of insurance providing care for major illness and hospitalization be favored?

* * *

The Nature of the Contributors' Answers.—In regard to Question 1, the answers were almost unanimous that deficiencies in the asking for, and giving of medical care did exist and, therefore, should receive coördinated attention.

The other questions, concerning compulsory health and voluntary group insurance systems, were answered in varying manner; social service workers, and executives of labor and similar organizations being largely in favor of compulsory insurance.

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

* For other items on this and related topics, see pages 234 and 243.

Scanning the opinions expressed, the impression one receives is that many of the contributors lean to compulsory health insurance, not so much because of their intensive study or knowledge of how such systems have worked in actual practice in European lands or the adaptability of the methods to America, but because seemingly they believe that the allocation of federal, state and local funds would be able to purchase "adequate medical care," just as easily and efficiently as groceries, dry goods or other commodities may be bought, in forgetfulness or disregard that "medical service" is a something quite different from any commodity, and from even other types of service that may be bargained for in the open market.

* * *

"Quality" of Medical Service Seemingly Forgotten by the Majority of Contributors.—Very few of the many contributors called attention to the all-important element of "quality" in medical service; most writers evidently taking it for granted that when such a large "quantity" of medical service was once bought with massive state and other funds—which would be accumulated under a compulsory health insurance system—there would be no deterioration in the "quality" of the medical service rendered. To our mind it is just here where a basic weakness and deficiency in compulsory health insurance systems are to be found, particularly as they would come into evidence, if attempt were made to apply them to Americans in the lower-earning brackets. It must be remembered concerning Americans possessing only lower incomes, that the standards of America lead all citizens not only to feel they should have the right to choose their physicians, but to expect a proper kind of professional service.

* * *

Element of "Successful Administration" Likewise Almost Overlooked.—Since compulsory health insurance in the United States, operating under governmental patronage and supervision, would necessarily mean a close identification and integration with the political system under which we live, the practicality of such a system must be carefully considered. In this connection, a brief paragraph from a letter of Dr. Ellen C. Potter, Director of Medicine in the New Jersey State Department of Institutions and Agencies, is worthy of special emphasis:

> In addition, may I quote Sir Josiah Stamp, who has said, "It is a mistake to legislate beyond our capacity to successfully administer." The lack of qualified personnel to throw into a nation-wide program in this field makes a cautious approach to this great undertaking desirable.

This basic thought of Sir Josiah Stamp, that "It is a mistake to legislate beyond our capacity to successfully administer," cannot be too strongly stressed in discussing medical-care problems, especially when compulsory health insurance methods are under consideration.

* * *

European Countries and Peoples Are Not the United States and Americans.—In line with Sir Josiah Stamp's opinion on legislative matters is that which was expressed by Sir Henry Brackenbury who, as a representative of the British Medical Association, had so much to do in planning the scheme under which England's compulsory system operates. On page 145 of California and Western Medicine, for September, 1937, we commented on Sir Henry's remarks at a dinner given in his honor in Los Angeles, at which he told those present that, under a political system such as exists in the United States, in which public servants on the civil list were in minor positions to political administrators, he doubted very much whether compulsory health insurance could be successfully carried out. Two paragraphs of those comments on reasons why the English system would not be workable in the United States appear below:

> The existence in Britain of the permanent civil service personnel, which has continuous and real authority to carry out the acts and laws of Parliament, no matter what political group may name the nominal heads of the governmental departments is a real aid in carrying through to successful operation a compulsory health insurance system.
>
> Without such expert, impartial and nonpolitical supervision, he was of the opinion that a health insurance system such as exists in England, Scotland, and Wales would in the United States, from the beginning, be enormously handicapped in its organization, and prove practically impossible of successful development. The distinguished speaker emphasized also, as his personal opinion, that it was doubtful, therefore, whether a successful health insurance system could be created here [United States] under conditions wherein political forces would be in major authority.

* * *

Give and Take Elements in Medical Care.—It is true that the health and well-being of many persons could be benefited if they would place themselves under proper medical care, and that the money loss entailed through absence from work because of illness would thus in part be overcome. It must be remembered, however, that, even though properly qualified physicians were placed within the reach of many such persons, it would not avail greatly if the citizens for whom that service was intended chose not to seek the medical advice in proper time; or if they sought it, and their illnesses were in good part dependent upon faulty modes of living or habits, they preferred the faulty habits and deterrent causative factors to the proferred medical service.

* * *

Knowledge and Experience of the Medical Profession Not to Be Underestimated or Displaced.—May it not also be said that, of all citizens, the medical profession, more than any other group, consists of men and women in whom the milk of human kindness leads to constant and generous service to their lay fellows, and that if medical care conditions were as bad as painted by some of the emotionalists, superficial thinkers and propagandists, under such conditions physicians would be among the very first to make insistent demand for change in methods? Let it be kept in mind that when medical care problems are soberly analyzed and all the contributory factors of illness given proper consideration, it will still be found that "adequate medical care for all citizens" will mean more than merely creating a large fund of public and other money, to be expended under

nonmedical, political supervision that, if one may judge by past performances under such control, would in all probability lead to much duplication and unnecessary and unwise hospital construction and administration, as well as bringing into being a vast mass of bureaucratic paper procedures intended to supervise and control the work of physicians. In such a plan, members of the medical profession, in a short time, would be little more than mechanized units in a system leading them, not to stimulation for highest grade of scientific achievement, but rather to maintenance of personal economic safeguards in a medical service and panel set-up of dull mediocrity.

* * *

Evolution Preferable to Revolution in Public Welfare and Health Projects.—That we are living in a rapidly changing world no one will deny, but that every proposed change is for the good, and increasingly so in proportion to its revolutionary nature, has not yet been proved nor can nor will it ever be. Whatever inadequacies in medical care exist, should of course be remedied insofar as is humanly possible to bring betterments into operation; and that applies to every portion of the United States. With such a program, members of the medical profession are everywhere in full harmony. Here in California, the medical profession is striving earnestly to solve public health, and medical and hospital care problems, and that by evolutionary, rather than revolutionary methods. The obligation of physicians is to stand firm for sane measures of change. Radical experiments in medical care that would leave both the public and the medical profession of California in a worse position than any that now exists or that has existed in this State, should receive no encouragement from physicians.

* * *

Medical Profession of California Is Trying Out Plans in Many Communities.—It is gratifying to know that in the counties which make up the State of California, physicians in each community are studying their public health and associated needs, and that the progress thus far made gives hopeful indication of satisfactory solutions and further advancement in the days ahead. The members of the California Medical Association and its component county societies are alert to their responsibilities in these important public welfare and health problems, and by trial-and-error methods are testing out various plans and procedures. They will not easily be tempted, therefore, to accept theoristic planning as a substitute for broad, practical experience and common sense.

NEXT YEAR'S ANNUAL SESSION

Scientific Program Placements.—An annual session is little more than over and a part of history, when plans must be laid for a convention in the succeeding year. Such early preparation is of importance, particularly as regards the scientific programs for both the general meetings and those of the twelve sections of the Association constituting the Scientific Assembly.

Every member of the California Medical Association who has been studying some special subject, and therefore has in mind the presentation of a paper on a topic of scientific or pertinent interest, should write at once to the secretary of the section before which he would prefer to present what he has to offer, in order that due consideration of his work may be made by the Committee on Scientific Work, when that body holds its conference next October. The roster of Section Officers is printed in each issue of California and Western Medicine on advertising page 6 of the front section, the names of members of the Committee on Scientific Work appearing on page 2. A member who submits the title of a proposed paper should also provide a brief outline of the article, as he has it tentatively in mind. Correspondence, therefore, with these officers and committeemen, is invited. It is also important to remember that applications submitted at the last moment have a lesser chance for approval.

* * *

Reservations at Hotel Del Monte.—The Hotel Del Monte has long been a favorite gathering place for members of the California Medical Association, the only drawback to that splendid hotel and its inviting setting of grounds and scenery being a lack of accommodations to care for all who look forward to being present at such an annual session of the State Association. Fortunately, in the nearby and almost equally well-known resorts are other hotels, each with its own allurement, and within easy reach by automobile travel of the Hotel Del Monte itself. Final arrangements for the next convention are now being made with the hotel management, concerning which detailed information will be given in the October issue of the Official Journal. In the meantime, it is suggested that members, who wish to be certain of satisfactory accommodations, should send their requests for reservations to the Hotel Del Monte, Del Monte, California, where in sequence they will be placed on file for future and proper consideration.*

FINAL CALIFORNIA ELECTIONS ON NOVEMBER 8

The Final State Election Is Near.—Before the current issue of California and Western Medicine is placed on the desks of its readers, the California state primary elections will be a matter of the past, and members of the California Medical Association, in common with other citizens, will know who are the candidates of the three major parties, as their names will appear on the final ballots for election in November.

* * *

Civic Obligations of Physicians.—In last month's issue of the Official Journal, and on page 154, under the caption, "Our Obligations Prior to the California Primary Elections," twelve items were mentioned which citizens alert to their civic responsibilities may be expected to recognize as obligations to keep in mind. They are of moment

* For address of Hotel Del Monte and other information, see page 224.

especially to physicians, because recently so much publicity has been given the subject of medical care, as evidenced in the press and conversation on the street. No other occasion in recent years has demanded, in the interests of both public health and the medical profession, keener watchfulness by physicians concerning the calibre and background of legislative servants. To emphasize this point, various articles and items are to be found in this issue, as for instance, those on pages 235 and 243.

Every member of the California Medical Association and its component county units knows that in matters of civic responsibility, officers of the State Association only can give general and procedure information. The real burden of service must be borne by the Association members themselves, exemplified through personal interest and investigation, and by contacts and exchange of views with friends and patients.

If, then, you failed to note the comments which appeared on page 155 of the August issue, it is recommended that you turn back the pages to them. They may have a suggestive value for action that would bring important information to the officers of the California Medical Association. As there stated, "When you help in this, you help yourself, your colleagues, the medical profession at large, and the still larger public."

PROPOSED "HUMANE DOG-POUND" LAW

Previous Articles.—Several articles* in recent issues of this magazine have directed attention to the proposed "Humane Dog-Pound Law," an initiative measure now sure to be found on the state election ballot in November. As previously here enunciated, the name of the proposed law is, in one sense, but a mask to cover up its antivivisection features; for that is practically what the proposition aims to promote.

It is useless to discuss, with members of the antivivisection cult, any feature of scientific animal experimentation designed to acquire more and greater knowledge concerning diseases common to human beings, dogs and other animals. An inspection of the printed matter widely distributed by the tireless antivivisectionist reveals immediately the one-sided outlook and bias of the advocates, no matter how well-intentioned individual members of that group may be.

* * *

Article by Dr. P. J. Hanzlik.—In this issue, on page 182, appears an article by Professor P. J. Hanzlik of Stanford University, on the great service rendered to the human race through studies on dogs, in connection with gas-poisoning researches alone. Reading which, we cannot suppress the thought, "How many of the proponents of the California 'Humane Dog-Pound Law' would be sufficiently consistent, in case California cities were menaced by gas poisoning from a foreign enemy, to refuse to avail themselves of the protective measures which scientific experimentation on dogs has placed at their disposal?"

May it not be fair, then, to assume that the antivivisection propagandists would be among the first to run for their gas masks?

In this issue, on page 242, appear other contributions that give additional information concerning the "California Society for the Promotion of Medical Research," an organization that is bravely and efficiently carrying on the major battle against this absurd "Humane Dog-Pound" initiative. It is a society whose membership roster might well contain the name of every licensed physician in California; so, if you are in doubt, write for further information to the society central office at 369 Pine Street, San Francisco.

The issues raised by this antagonistic move of the antivivisectionists are grave; the need of united coöperation is apparent; and a vigorous support is most important. "Lend a hand!"

AMERICAN MEDICAL ASSOCIATION CALLS SPECIAL SESSION OF HOUSE OF DELEGATES!

At the time the forms of this September issue are being locked for the press, we are in receipt of a call for a special session of the American Medical Association House of Delegates. For additional information, see items in the California Medical Association department, on page 221.*

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 221.

* Under date of September 1, the secretaries and editors of constituent state associations were invited by the American Medical Association Board of Trustees to be present at the special session of the House of Delegates which will be held in the Red Lacquer Room of the Palmer House on Friday, September 16. (This meeting will take the place of the 1938 conference of state secretaries and editors which is usually held in November.)

The California Medical Association delegates and alternates to the American Medical Association House of Delegats are:

DELEGATES	ALTERNATES
C. A. Dukes, Oakland	Edward N. Ewer, Oakland
E. M. Pallette, Los Angeles	W. H. Kiger, Los Angeles
Robert A. Peers, Colfax	F. F. Gundrum, Sacramento
W. R. Molony, Los Angeles	J. C. Ruddock, Los Angeles
Elbridge Best, San Francisco	R. S. Stone, San Francisco
Lyell C. Kinney, San Diego	Bon O. Adams, Riverside
J. P. Nuttall, Los Angeles	F. M. Pottenger, Los Angeles

The medical profession is traditionally conservative and it is the part of wisdom to proceed cautiously. Yet, while other human activities go forward and new methods and techniques are born the practice of medicine must necessarily change also. To a living organism or a living organization change is the one universal law. Still it may be fatal if too sudden or too violent.

EDITORIAL COMMENT†

LABILE BACTERIAL ANTIGENS

On storage at 4 degrees centigrade streptococcus vaccines are oxidized to immunologically inert substances. The same vaccines are denatured by heating to 56 degrees centigrade for thirty minutes, or by exposure to even the mildest chemical antiseptics. This discouraging result, currently reported by Dr. Stuart Mudd and his coworkers,[1] of the Department of Bacteriology, University of Pennsylvania, offers a plausible explanation for many streptococcus vaccine failures of the past.

Highly labile components in bacterial antigens were first described about two years ago by Chembers and Flosdorf,[2] who studied the immunochemical properties of virulent streptococci disintegrated in a sonic vibrator. The resulting "sonic supernate" would completely bind, inactivate or remove serum antibodies. This property was completely lost, however, if the supernate was heated to 75 degrees centigrade for fifteen minutes, or stored in the refrigerator for three to ten days.

These labile antigens have been currently restudied by Doctor Mudd and his coworkers through their new lyophile ball-mill method. The streptococcus suspensions were frozen about the inner periphery of the ball-mill disk, then dried by the lyophile (vacuum) process. The resultant lyophile vaccine was then ground by the rotation of the disk in an external freezing mixture (dry ice in methyl cellosolve). The resulting bacterial debris was taken up in distilled water and sterilized by passing through a Berkefeld filter. The Philadelphia investigators found that the labile component in this filtrate can be precipitated by mild acidulation with HCl (p^H 4.5). The yield was from 10 to 20 per cent of the dry weight of the microörganisms, depending upon the strain of streptococci used. Antibodies against the freshly prepared labile precipitate specifically promote agglutination and phagocytosis, and protect mice against lethal doses of living streptococci.

Of special theoretical interest is their finding that the freshly prepared labile precipitate can be split into two haptens by acid-hydrolysis. One of these is type-specific, the other group-specific. Since only the type-specific fraction is serologically demonstrable in intact streptococci, it would appear that the labile hapten-complex is so oriented on the surface of the bacterial cell as to expose only the type-specific hapten. If this is true, a simple change in the orientation of this surface colloid might account for the numerous "dissociations" or "transformations" of streptococci described in recent literature.

Of even greater theoretical interest is Doctor Mudd's finding that in the presence of certain reducing agents the labile hapten-complex is changed to a hemolysin, lucocidin or lethal toxin. Thus far, it has been assumed by most bacteriologists that hemolysin, leucocidin and toxin are "independent variables" in streptococci.

The greatest contribution of Doctor Mudd and his associates to clinical theory, however, is their implication that a restudy of currently unsuccessful bacterial vaccines by their method of lyophile disintegration might yield other labile antigens of practical value. Successful labile vaccines for tuberculosis or malignant disease are not beyond research hope.

TREATMENT OF THE COMMON VASCULAR HEMIPLEGIAS

The common vascular hemiplegias are of three pathological types: thrombosis, hemorrhage, and embolism. They all give, superficially, the same clinical picture, and are often described in textbooks together as apoplexy; yet they differ so strikingly in their fundamental natures, and in the treatment required, that they should be sharply distinguished.

Their relative frequency is not known and is not likely to be determined. This is because one cannot at all depend upon the clinical diagnoses for reliable classification, and when one is dependent upon autopsy findings one must accept largely institutional material. This means that all of the most severe cases are omitted because the patients die before hospitalization can be effected. Hiller, in a monographic article in the new "Handbuch der Neurologie" by Bumke-Foerster, in reviewing the statistics of various authors quoting autopsy material, finds that hemorrhage varies in frequency of occurrence from 20 to 71 per cent. Hiller's own analysis of fifty-nine cases showed fifteen instances of embolism, sixteen of thrombotic softening, and twenty-eight of hemorrhage. In any receiving hospital, hemorrhage far outweighs other causes in a hospital for chronic diseases. The only reliable figures concerning actual occurrence would be from private practice covering a large period, with autopsy in every case.

If one can be certain that a thrombosis has occurred in a given case of hemiplegia, the treatment is quite definitely indicated. The patient should be placed in bed with the head low (foot of the bed elevated), in order to increase the cerebral circulation. Vasodilators may be given (sodium nitrite or acetyl choline), though this is of less importance than the omission of the ice-cap so commonly applied. Intravenous isotonic fluids are certainly indicated. Ordinarily 500 cubic centimeters of normal saline, twice daily, may be used if it is well tolerated. Potassium iodid is commonly given, and does no harm though it probably does no immediate good.

With the above treatment the response of patients with cerebral thrombosis is usually good and sometimes striking. It is readily seen, however, that if the case is incorrectly diagnosed as throm-

† This department of CALIFORNIA AND WESTERN MEDICINE presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

1 Chambers, L. A., and Flosdorf, E. W.: Soc. Exper. Biol. and Med., 34:631, 1936.

2 Mudd, S., Czarnetzky, E. J., Lackman, D., and Pettit, Horace: J. Immunol., 34:117, 155 (Feb.), 1938.

bosis instead of hemorrhage, the death of the patient will be hastened. Hemorrhage should be treated in the diametrically opposite manner. The head of the bed should be raised, an ice-cap should be applied to cause reflex vasoconstriction, and if the hypertension is excessive, the old-fashioned venesection may be of value. If the hemiplegia is due to embolism, the treatment is governed by the cause of the condition. When the immediate cause of the hemiplegia is in doubt, it is best not to treat the patient specifically.

The cases in which there is doubt are not at all rare. In hospital practice one receives patients who have been picked up by the police on the street or in hotel rooms, for which reason the most important single item in the differential diagnosis, the history, is lacking. Embolism is first to be excluded or detected if possible. In an unconscious patient this is extremely difficult. In a young patient it is quite likely to be the underlying cause. If history is available, one learns that the patient fell as though shot.

Hemorrhage is next most rapid in onset, but it usually occupies half an hour to an hour, and if slow may take twelve hours. The blood pressure is usually high and the artery affected is one of the intracerebral ones, not one on the surface. Loss of consciousness is the rule, and there is apt to be xanthochromia if not actual blood in the spinal fluid. Available history usually states that the patient was engaged in active exercise at the time.

Thrombosis usually occurs during the night or during rest. The blood pressure may be high or low, but arteriosclerosis is present in either case. It is gradual in onset (which may be learned if the accident occurs in the day time). Recurrent attacks, finally becoming complete and permanent, indicate thrombosis rather than either of the other types. If consciousness is not lost, one should strongly suspect thrombosis.

With a differential diagnosis in mind, much can be done for the patient with cerebral thrombosis, even if the patient is not seen for several days.

Insulin in Treatment of Acute Mania.—Grosh states that recently at the Ypsilanti State Hospital three cases have been observed of apparent diabetes mellitus occurring during the course of the manic phase of manic-depressive psychoses. Two of the cases referred to were studied not only during the periods of acute elation but also during lucid intervals of more normal activity. The study of the dextrose tolerance curves taken during these two periods demonstrates that, while in neither period are they consistently grossly abnormal, still there is a distinct prolongation of the blood sugar elevation during the elated period when compared to the curves obtained under normal conditions, which are suggestive of increased tolerance. This comparison suggested that there was some relative loss of tolerance during the attack for which insulin might be used in a remedial rôle. In both of these cases it might possibly have been mere coincidence that the psychomotor activity was sharply cut down to the normal level after a few days of insulin therapy. None the less this type of therapy is suggested as a reasonable procedure in the acute relations in which the dextrose tolerance test reveals a relatively high type of curve when compared with the curve in normal activity.

USE OF DOGS IN DEVELOPING TREATMENT OF WAR GAS POISONING*

By P. J. Hanzlik, M.D.
San Francisco

NATIONS of the world are preparing for war as never before. New methods and chemicals are being feverishly developed so no one may be caught napping, as were the Allies in the World War. The Allies will never forget the surprise attack by the Germans at Ypres in April, 1915, when great quantities of cylinder gas were released with ghastly effects. As a result, hundreds of American and foreign scientists engaged in chemical and animal experimentation and eventually developed methods of protection and treatment of inestimable value to the troops at the front.

POISON GAS THREATS: NEED OF SAFEGUARDS

A few of these scientists remained at their government posts to continue the work of preparedness in peace times. This was indeed fortunate, for undeclared wars and propaganda for war poisons have continued since then almost uninterruptedly. Already now, the threat to use poison gas in warfare seems a stark reality which is almost universal. A subsidiary aspect, though not less important toxicologically, is a certain usage of poison gases in civilian life, as police measures and in industries. Hence, the desirability of understanding their physiological actions seems obvious.

Equally, or more, important from the public standpoint is the development of safeguards or protective measures against exposure to war gases and antidotes and methods of treatment in case of poisoning.

Yet, today, there are people in California who, no doubt, unintentionally would create a situation that would stop all this essential work for state and country. While they do not realize it, they are, nevertheless engaged in activities which would prevent developing protective and therapeutic measures for defenseless people and animals. For it requires no great stretch of the imagination to visualize what would happen to the unprotected cities of the Pacific Slope and their populations in case of a sudden gas attack.

PROPOSED "STATE HUMANE POUND ACT" FOR CALIFORNIA

However, the initiative measure entitled the "State Humane Pound Act," which aims at elimination of all animal experimentation from scientific research in medicine and related fields, would aid the attacker's purpose. This measure is ostensibly intended to take care of unclaimed dogs and cats, but everyone who understands the language of the measure knows that it actually will stop the use of all animals for the investigation and relief of human suffering, whether the result of disease or gas warfare.

* From the Department of Pharmacology, Stanford University School of Medicine, San Francisco.

The public cannot remain indifferent to situations which might give comfort to potential enemies and render defenseless unfortunate soldiers and people; yes, even the poor wretched beasts for whom the "antis" profess so much agonizing sympathy! Where is the antivivisectionist who has done anything for the dog in gas warfare, let alone soldiers and people ? However, the dog has repeatedly rendered such patriotic services. Let us consider the dog's record in chemical warfare, as the "antis" have nothing comparable.

THE DOG'S RECORD OF UNSELFISH SERVICE

The dog's splendid record of unselfish service is to be found in the late Lieutenant Colonel Frank P. Underhill's book, entitled "The Lethal War Gases, Physiology and Experimental Treatment," published in 1920 with the permission of the United States Director of Chemical Warfare Service. Humanity owes a debt of gratitude to Professor Underhill in compiling this remarkable record of work done by him and his associates on dogs and other animals. None can complain now of lack of preparedness in case war should come. For in this book there are all the principles, necessary procedures, and numerous results described in great detail, which only require application. In the preface to his book, Colonel Underhill remarks as follows on the results obtained along lines of treatment:

> Before data in this direction could be obtained the Armistice was signed. A sufficient number of gassed men were observed, however, to demonstrate the similarity of their condition to that of the experimental cases. The successful treatment of the latter by the therapeutic measures evolved made probably an equally successful outcome of the proposed trial in the field with human cases of gas poisoning.

The truth is that these very treatments worked out on animals during the war have been of inestimable value in civilian cases of poisoning in peace times. Thus, the results of these animal experiments are more than doubly valuable, for no one would be so selfish and unreasoning as to deny such benefits to man and beast, especially the dog.

HOW DOGS WERE USED IN THE EXPERIMENTS WITH WAR GASES

There is no doubt that dogs were used extensively, if not mostly, in the experiments with war gases. Besides the record in Underhill's book, there is ample testimony of this usage in the reports compiled in "The Medical Department of the United States Army, Vol. XIV—Medical Aspects of Gas Warfare," prepared by Major General M. W. Ireland, Surgeon-General, and published by the Government Printing Office in 1926. The other animals used to a considerable extent were goats, and sometimes the experimentalists themselves served as experimental subjects.

These compilations indicate that in the beginning of the war the lung irritants used with military success by the Germans were chlorin and phosgene (palite). The unprepared Allies scarcely knew where to turn for relief or remedy.

CHLORIN-GASSED DOGS

Speaking of his experimental results in treating chlorin-gassed dogs, the German gas used at Ypres in 1915, Underhill states, in General Ireland's compilation:

> The method of treatment is especially recommended because it is simple and harmless and because it is based upon clinical usage and experimental evidence. . . . Venesection, of course, has long been employed in conditions involving pulmonary edema and congestion. Recently it has been applied, with conflicting results, in the treatment of these conditions induced in man by poisonous gases in warfare. Inasmuch as the incidental observations with blood letting indicated a favorable influence upon gassed dogs, it was deemed desirable to determine, under exact conditions, the effect of venesection upon the mortality of dogs receiving a lethal concentration of chlorin gas.

Such was the controversial state of the treatment problem in war gas poisoning before controlled experiments were begun on dogs. That dogs might be more specifically suited than other animals is indicated by the following statement:

> These figures indicate clearly the therapeutic value of venesection after chlorin poisoning in dogs under the conditions of the experiment. The result is at variance with that reported by British investigators upon goats (p. 681).

GAS POISONING FROM PHOSGENE

Although chlorin was soon abandoned for the more efficient phosgene (palite), Underhill states:

> It was not until a study of phosgene poisoning was made that an adequate conception was obtained of the fundamental principles involved in gas poisoning. The treatment for chlorin poisoning was evolved by more or less empirical methods, whereas in the case of phosgene the changes taking place in the blood were well recognized and the stages of phosgene poisoning quite clearly defined previous to any extensive attempts at therapeutic measure. This understanding of the problem led to a much more rational plan of attack with regard to treatment.

This treatment was worked out on dogs instead of goats or other animals for reasons made clear by Underhill on page 181, where he states:

> From the clinical pictures presented by these gassed individuals it became quite evident that the conditions existing in man and the dog are remarkably similar if not identical!

CHLORPICRIN GAS POISONING

In discussing his experiments on treatment of pulmonary irritation and edema from chlorpicrin (superpalite) in dogs, Underhill states (p. 159):

> As may be seen in Table 81 the mortality of the treated animals is decreased from 90 to 57 per cent by a single bleeding in a severely gassed goat. This large reduction in mortality in the ninety-five animals used in these experiments demonstrates conclusively that bleeding is an efficacious therapeutic procedure when applied early to goats gassed with high concentrations of picrin. These data have been subjected to statistical analysis and found to be conclusive.

In comparing the results of bleeding in goats with those in dogs, Underhill points out a difference (p. 161):

> As shown in Table 82, the results obtained from this type of treatment at both concentrations (chlorpicrin) are practically identical with the regular toxicity figures, and it appears clear, considering the large number of animals used, that this type of treatment is of no benefit.

The difference between goats and dogs is further emphasized on page 163:

> In the animals (dogs) which are seriously affected, this basic treatment of bleeding or supplying of fluid by mouth or intraperitoneally is not sufficient to save the animals.

Further confirmation of the futility of bleeding alone in dogs, but which was successful in goats, is given by Underhill on page 177:

From the results of the experiments on the dogs which were placed in the oxygen chamber after venesection it is clearly evident that the respiratory function of the blood is not improved by venesection alone.

Clearly, then, the treatment worked out on gassed goats could not have benefited gassed soldiers, since the latter would react like dogs which could not be successfully treated. It is believed that the lungs of dogs are more sensitive than those of goats, and also those of men. Eventually a mixed treatment with several measures was found beneficial in animals, and apparently also in men, as far as applications had been made.

EXPERIMENTAL VALUE OF DOGS WITH "VOMITING GASES"

Another case of the indispensability of dogs in war-gas studies is that of the so-called "vomiting gases" (chlorpicrin and others). Ruminants, such as goats and cattle, do not vomit and thus show only the lachrymatory and respiratory irritant effects. But dogs, like men, react to these compounds with coughing, nausea, retching and vomiting. These symptoms cause soldiers to discard their masks and then they inhale the irritant gas with fatal effects. It is well known to veterinarians that the successful use of emetics among domestic animals is limited to the dog, cat, and pig, and thorough washing of the stomach is practicable only with the dog. Obviously, then, only the dog could be used to determine the efficiency of antidotes and treatment for gases which cause vomiting.

SPECIAL VALUE OF DOGS IN EXPERIMENTAL STUDIES WITH POISON GASES

The following succinct reasons for using dogs, in preference to other animals, are given on page 421, Vol. 14, "Medical Aspects of Gas Warfare," by Major M. C. Winternitz, M. C., who studied the pathology of certain war gases. In describing the effects of chlorin, he states:

In these studies the dog was the experimental animal of choice, although, as with other gases investigated, various other animals (guinea pigs, rats, mice, rabbits, cats, monkeys, and goats) were used by way of comparison. The reason for using the dog is that, in the study of the respiratory irritant gases, to which group the majority of war gases belong, this animal has certain well-recognized advantages: (1) The lungs and other organs are sufficiently large to make gross examination easy. (2) Anatomically the respiratory tract resembles closely that of man. (3) The conditions of pulmonary infection and the reaction of the lungs to bacterial and other injuries are much the same as in human beings."

WHY HERBIVORA ARE OF LESS VALUE

The herbivora, which include the ruminants, are not suited to the determination of chemical changes in the blood, such as acidosis, which develop during the action of the lung irritant war gases. The dietary habits of these animals are so different as to make it difficult to demonstrate the manifestations of acidosis. But not so dogs; these animals are admirably suited to the observation and treatment of this condition. Here belong also certain metabolic actions to which the dog is better suited physiologically than the herbivorous ruminants. In these respects the dog is again closer to man than goats or sheep, something long ago recognized by physiologists and biochemists, but apparently wholly unknown to the antivivisectionists.

AN EXAMPLE OF HALF-TRUTH EXPLOITATION

An amazing credulity is revealed by the following statement of an antivivisectionist, a Mr. Quinn, testifying before a subcommittee of a committee of the House of Representatives on H. R. 3890:

Recently an American judge sentenced a miscreant to one year in prison for setting a dog on fire with kerosene. Yet in medical laboratories dogs by the hundred are being burned with chemical gases by men who pose before the public as scientists. Not only is the suffering comparable in the two cases, but undoubtedly the dogs have read, if the scientists have not, that certain of the cyogen [meaning *cyanogen*] compounds used in gas warfare while being extremely toxic to dogs leaves goats and man unharmed. (*To Prohibit Experiments Upon Living Dogs, etc.*, United States Government Printing Office, Washington, 1938.)

Truly enjoyable must be a little canine fiction for Mr. Quinn, but let him consult the accurate records of the War Department, which depict the exploits of the dutiful dogs in chemical warfare service, and the sufferings of soldiers at the front, lest he be disappointed when the nations turn loose their "dogs of war."

OBLIGATION OF HUMANITARIAN CITIZENS

Meanwhile the duties of intelligent, wise, and practical people are plain. They must see to it that mankind is not deprived of the benefits of animal experimentation for the relief of human suffering and the control and treatment of disease, including war-gas poisoning. They must support the scientists and prevent attempts at saddling them with legal restrictions which would deprive them of experimental materials necessary in defense work for the country and the people.

The proposed "State Humane Pound Act," which would deprive scientists of the use of dogs and cats, and eventually all other animals, must be voted out of existence. California and the nation must be kept organized and active in proper scientific study of chemical warfare in line with other nations. At the time of the World War all the foreign armies, but especially the German, French, British, and Russian, were extensively organized for experimental research in the physiological action of war gases. This included the treatment, prevention and control of their effects. According to various reports, these organizations have not only been kept intact but greatly expanded.

The least that we can do for our own safety and the protection of our soldiers, and even our domestic animals, is to preserve the present system of scientific animal experimentation and vigorously register a protest against any proposed interference or action.

CHEMICAL WARFARES OF THE FUTURE

Lest anyone be deceived by subversive propaganda or misguided statements regarding scientific preparation for war, I may quote the following recent statements by Professor Ferdinand Flury of Würzburg ("Ueber den chemischen Krieg," Vol. 3, Gasschutz u. Luftschutz, 1937) to indicate the German attitude on the future chemical warfare:

The new forms of coming wars demand new methods. But the old methods may be improved, refined, and perfected into novel and better forms. Little will be done about the search for ever more active and toxic war compounds, as was the aim in the World War, since development here has reached a certain limit. The order of magnitude of one gamma, or one-millionth of a gram, which is equal in activity to a milligram for other war compounds, is hardly to be exceeded at present. Among the first considerations, there is no longer the killing, *i. e.*, annihilation, of the opponent, but rather the attainment of the greatest military objective according to the method which gets results. Anticipation, or thwarting, of the enemy's attack is a specially desirable aim. Toward that end, it may be considered that further development will proceed with the known types of green, yellow and blue cross gases. It is to be kept constantly in mind that there is no physical or spiritual function of the human organism which cannot be influenced by chemical means. . . . It would be fatal to accept the fact that the next war will begin where the last one ended. Meantime, there have been going on for decades the most intensive scientific developments in foreign countries, rich in technical progress in all fields. Obviously, the situation in chemical warfare will be an entirely different thing from that in the past. Indeed, we must consider that, in the future, the surprise may come from the other side. Therefore, Germany must work with all her means so she is not eliminated at the first attack, without a battle. For military reasons and self-preservation she must arm herself against surprise. Here is an earnest warning, and also an indication of the coming problem. This can only be solved with the coöperation of science and by pooling of all her resources and methods.

Leave it to the Germans for efficiency, foresight, and thoroughness. All that and more than Professor Flury says will be done. No stone will be left unturned, and there will be surprises for her opponent to assure Germany an early victory. Science, indeed experimental science in all departments, is now, and always has been, at the command of German war strategists for utilization of bigger and better chemical warfare. Could anyone be so naïve as to believe that German dogs and cats will be spared inconveniences of the general staff's methods for preparedness? Let us take heed and profit by the timely warning and allow no one, or nothing, to interfere with preparedness for the future chemical warfare in both defense and offense through animal experimentation.

SOME QUERIES FOR SENTIMENTAL ANTIVIVISECTIONISTS

Finally, and with all due consideration for their human qualities, it may be asked: Do not these sentimental antivivisectionists stultify themselves in the eyes of thinking citizens?

What is their answer to the delectation of their appetites with the flesh of slain animals? Do not they keep their feet and hands warm with shoes and gloves made from the hides of these same animals? What about the protection against and cure of disease among thoroughbred horses, cattle, hogs, poultry, in fact, all domestic animals? Even man's best friend for ages, the faithful dog! How do they justify the commercialized exploitation of confined, miserable wild animals in circuses and menageries? Are they not the cruel beasts, those outside and not within the cages and circus rings, that feast their emotions on exhibited and confined animals?

Perhaps selfish motives will not allow intervention in this and other inhuman conducts. Yet these "antis" stop at nothing to prevent the use of dogs and other animals in properly conducted scientific experimentation for the alleviation of human and animal suffering. The only consistency in these inconsistent attitudes is the unsportsmanlike conduct of the antivivisectionists.

For their sake, for our sake, and for the sake of all animals, whether in war or in peace, California's proposed "State Humane Pound Act" must not pass!

Stanford University School of Medicine.

THE IMPORTANCE OF THE EMERGENCY TREATMENT OF COMPOUND FRACTURES*

By Frederic C. Bost, M.D.
San Francisco

COMPOUND fractures are emergencies of the first order. This fact should be well established in the minds of all physicians and surgeons, for there are in the literature sufficient data to substantiate this statement. That compound fractures are not universally treated as emergencies seems most deplorable. The number of improperly treated cases seen late by clinics and specialists emphasizes the need for constantly bringing this problem before the medical public. Physicians in general cannot possibly realize the tremendous importance of early proper treatment, for, if they did, the common practice of delayed treatment would not be so prevalent. Local infection, general sepsis, gas gangrene, loss of limb, and chronic infection with seriously impaired functional end-results, and loss of life, frequently might be averted if we were all ever alert to the great necessity for immediate and adequate treatment. To bear out these contentions, I should like to cite two incidences:

Case 1.—I was called to see a boy, age 18, injured in a motorcycle accident some five hours previously. A local fireman had applied a crude wooden gutter splint, had saturated the gaping wounds and projecting tibia and fibula with iodin, and the physician had called a consultant only at the urgent request of the members of the family. It required considerable tact and an unalterable firmness to convince the physician that definitive treatment should not be left until the following morning. By immediate thorough debridement, wound cleansing, fracture reduction, primary wound closure, and proper fixation this patient was saved from innumerable dangerous complications, and the result was eminently satisfactory.

* * *

Case 2.—The second patient, about the same age, presents the opposite and tragic analogue to the first case. This patient was also a victim of a motorcycle accident. His lacerated lower leg, with compound fracture, was immediately dressed by a physician and placed in a pillow splint for twenty-four hours, during which time the foot and lower fragments angulated sharply enough to deprive themselves of all blood supply. The sudden onset of high fever, due to sepsis and gas gangrene infection, called for amputation, but too late to save the victim's life. These two cases represent two extremes; but between them lies a wide field for thought and discussion concerning compound fracture treatment.

* From the Department of Surgery, Orthopedic Division, University of California Medical School and the San Francisco Hospital.

Chairman's Address, Industrial Medicine and Surgery Section of the California Medical Association at the sixty-seventh annual session at Pasadena, May 9–12, 1938.

INITIAL PROCEDURES

The moment of injury initiates the need for prompt and effective treatment. We have all been remiss regarding the immediate handling and transportation of our injured. We leave these important details to untrained or partially trained ambulance attendants, who should and must be taught by us the vast significance of their duties. Hemostasis, wound protection, effective immobilization of injured parts, and swift transportation constitute the first steps in treatment.

The second step, equally important and usually no better handled than the first, is the setting into prompt action of medical and hospital services required by the patient. The physician must be called promptly and respond immediately, for it is he who must survey the wound and the requirements of the patient and supply the measures to combat shock. The physician's services are usually far more easy to obtain that those of the hospital surgery, the x-ray services, and the anesthetist, whose promptness is equally necessary. No matter how prompt the surgeon, his efforts are frequently blocked by the uncoöperation of these accessory services, whose members, unfortunately, can rarely be made to realize the costliness of even momentary delay. Education of his coworkers by the surgeon for a second time becomes paramount.

SUBSEQUENT MEASURES

Third, we must consider the definitive treatment of the wound and the fractures. There is much difference of opinion concerning this stage of treatment. Despite these variations, the principles of treatment remain the same and should be thoroughly understood by all who are called upon to treat the compound fracture. The desired goal is represented by healed skin and soft tissues surrounding a bone in good functional alignment. In general, this requires the following measures:

1. Thorough cleansing preparation of the skin.
2. Rare judgment as to the need of deep-wound cleansing.
3. Thorough debridement of skin edges and soft tissues and bone.
4. Free lavage of the wound.
5. Hemostasis.
6. Reduction of the fracture.
7. Closure or other treatment of the wound.
8. Immobilization of the fracture fragments.
9. Special prophylaxis against infection.

COMMENT

The following discussion concerning these measures is based upon an experience of several years, during which time over 150 cases of compound fractures have been treated at the San Francisco Hospital on the University of California Service. It is thoroughly recognized that no one type of treatment is applicable to all compound fractures, but the general plan may be suited to the individual need.

It should here be stated that the element of time cannot be overemphasized. It is an extremely important factor in that treatment that might be possible during the first few hours after injury may be entirely impossible later. Also the rigid fixation of fractures during transportation needs reëmphasis, for great additional wound damage may occur between the accident and the appearance of the patient for definitive treatment.

CLEANSING OF THE SKIN

The wound should be covered while hair, grease, and dirt are removed from the surrounding skin areas. Previous to this time we do not believe that the external application of antiseptics is of any value.

DEEP-WOUND CLEANSING

This is a most important step. Many errors may be committed by failure to open what may appear to be a minor skin perforation. Careful inspection and palpation may reveal the softening and bogginess of tissue maceration or of a large hematoma. When in doubt the perforation should be thoroughly opened.

CASE 3.—The case of a male, age 19, injured in an automobile accident stresses this point. He was treated seven hours after injury, and had over the tibial fracture two small puncture wounds, which were bleeding freely. The wounds were merely dressed, and four days postoperatively a massive staphylococcus infection appeared at the fracture site. Thorough drainage, followed by amputation at nineteen days, failed to suffice and the patient expired on the twenty-first day from sepsis and gas gangrene, following an injury which was seen early enough to have been thoroughly debrided and closed.

THOROUGH DEBRIDEMENT

The traumatized wound edges should be sparingly trimmed away, the deep structures of the wound must be thoroughly exposed so all devitalized tissue can be completely excised, including dirty periosteum. The fascial spaces must be thoroughly explored. Loose bone fragments should be mobilized, thoroughly cleansed and left *in situ* to prevent nonunion from loss of bone substance. There is no excuse for failure to enlarge the wound sufficiently to thoroughly expose all of the structures within the damaged area. Without extreme caution tragedies may occur because a potential nidus of infection, however minute, is not exposed.

LAVAGE OF WOUND

The essential factor is free use of fluid for thorough mechanical washing of all the interstices of the wound. The chemical content of the irrigating solution cannot make up for insufficient washing. Tap water and saline are probably as effective as any other solutions. At least a gallon of fluid should be used.

HEMOSTATIS

Vessels of consequence should be ligated with due care that unnecessary ligature and its attendant planting of foreign material be avoided.

REDUCTION OF FRACTURE

Gentleness, and nontraumatic methods are the best insurance against disaster. The reduction should correct angulation, which causes pressure of bone against skin surfaces. The corrected position should be maintained while the limb is being placed in its immobilizing apparatus.

CLOSURE OR OTHER TREATMENT OF WOUND

Wherever possible and within certain arbitrary time limits, we favor the transposition of the compound fracture to a simple fracture by complete wound closure. This closure we effect, even when there is skin loss, by transverse incisions which allow mobilization of skin flaps to cover the traumatized area. Arbitrarily, we have set eight hours as the dead line for primary closure. There may be exceptional instances where closure after a longer time may be employed, but in these instances the relative danger is so high that one should ever be cognizant of the possible complications which might follow such treatment, and be ready to alter the treatment immediately upon their appearance. After eight hours the use of the Orr pack or of frequent wound irrigation is the method of choice. Our results with wound closure within eight hours have yielded a very low percentage of failures. On the other hand, the instance of sepsis in the open treatment has been great. This strengthens our convictions regarding the merit of early treatment, thorough cleansing, and immediate wound closure.

In order to employ this ideal and most simple method, all of the previously mentioned measures must be carefully carried out, and prudent judgment must be exercised.

Case 4.—For example, a five-year-old boy, who fell six feet, fracturing his radius and ulna, had a small perforated wound over the site of the radius. He was treated eight hours after injury, but the small perforated wound was merely enlarged to four centimeters, a size that did not permit a thorough lavage, and the wound was closed. A very lengthy strenuous and traumatizing attempt at reduction followed wound closure. The day following surgery he had a sharp febrile rise and developed gas gangrene involving all the muscles of the forearm. Neither serum therapy nor open debridement saved the arm from amputation.

This patient's treatment was delayed for five hours while hospital authorities were trying to contact his parents. The debridement was insufficient and the wound closure and the fracture treatment disastrous. Any of these factors or a combination of them might have been responsible for the end-results.

* * *

Case 5.—A second case illustrates the inadvisability of attempting to save a limb when there is too much primary damage. This man, age 48, was struck by falling lumber. He had extensive skin lacerations, and when the wounds were debrided three hours after injury they showed massive muscle pulverization. The wound was debrided thoroughly and treated by Dakinization, but circulation failure and sepsis resulted in the patient's death. Primary amputation with either open or closed flaps very likely would have saved his life.

IMMOBILIZATION OF FRACTURE FRAGMENTS

In our case series we have employed internal fixation only twice. In both instances the wound was closed primarily and no untoward results occurred. These were carefully chosen cases treated early. We do not generally favor internal fixation, but fully realize it can be used with the Orr pack or other open methods.

External fixation by means of pin traction with the pin far removed from the site of fracture, or a plaster cast with or without pin fixation, have been the most satisfactory methods used by us. In some of the earlier cases four pin-fixation methods had been used. This usually means that pins may be in close proximity to the fracture and, in fact, four cases treated by this method resulted in infection and chronic sepsis.

SPECIFIC PROPHYLAXIS

Routinely, our cases have been given 1500 units of antitetanic serum.

We have not used gas gangrene antisera routinely, but in badly macerated cases have given a therapeutic dose of 20,000 units at once and have repeated this frequently if we felt it necessary.

IN CONCLUSION

The purpose of this presentation has been to make a plea for the recognition of the compound fracture as an emergency. I have attempted to point out the importance of the early and the immediate treatment of the compound fracture. I have stated in detail what I consider the important steps in the adequate treatment of such fractures, and have called attention to some of the complications which may occur when important principles are neglected.

INTRATRACHEAL INSTILLATION OF LIQUID PETROLATUM: PULMONARY INJURY THEREFROM*

By George Hamilton Houck, M.D.
Los Angeles

Discussion *by Dean E. Godwin, M. D., Long Beach.*

FOR almost fifty years certain inflammatory lesions of the respiratory tract have been treated by some physicians with intratracheal instillations of warm liquid petrolatum, usually containing small quantities of camphor and menthol. Little attention was given to the pathogenic potentialities of oil within the lungs until about ten years ago, and even then the lung injuries which aroused the interest of the pathologist were due to the accidental aspiration of oils in young and debilitated infants. A smaller number of cases of fatal lung injury due to oil have been reported in adults. One patient[16] aspirated butterfat because of cardiospasm, and in another[9] the source of the mineral oil was not known. Laughlen's patient,[11] who had a laryngeal paralysis, was given nasopharyngeal instillations of mineral oil. Other adults[1,3,5,15] were the victims of prolonged self-medication with large amounts of mineral oil used by nasal instillation.

TERMINOLOGY

No satisfactory terminology for this pathological process has developed. The primary acute reaction has been called lipoid pneumonia.[14] Ikeda[9,10] has recently suggested the term "oil aspiration pneumonia." This disease, which is most frequently seen in the infant, is terminal as a rule; but an occasional adult survives, and the major portion of the pathological change is then due to the slowly developing fibrosis. This has been termed "pulmonary induration," "pulmonary contraction,"[3] "pulmo-

Fig. 1.—Chest roentgenogram taken six years after onset of symptoms. The right lower lobe persists only as a solidified remnant lying in the cardio-hepatic angle. There is an increased translucency of the entire right lung field due to compensatory expansion of the right upper lobe. Similar changes have taken place upon the left.

nary cirrhosis,"[1] and "pulmonary oil granuloma."[8] This late result, which is frequently fatal, is chiefly important from the point of view of its prevention. It is always a therapeutic disaster and is rarely unavoidable. The use of oils in the treatment of diseases of the respiratory and gastro-intestinal tracts has increased greatly within the past few years. It is unfortunate that little attention has been paid to the possibility of harm, if these oils gain entrance to the terminal bronchioles and pulmonary alveoli. Experimental work[7,12,13,9] has shown that certain classes of oils are less dangerous for use in the nose and throat. Analysis of the case histories of patients who have developed pulmonary oil injury indicates those conditions in which aspiration is most likely to occur. Some cases are caused by self-medication, and the physician must watch for those patients who are given to the use of large amounts of medicated mineral oil in the upper respiratory passages.[15]

The following instance of an adult fatality from lung injury produced by mineral oil is unusual in that the intratracheal instillations were all given by a physician in the treatment of an acute bronchitis. The resultant illness persisted for six years and eight months, following the original oil injury, with the production of extraordinary changes in the lungs due to the fibrosis which followed the initial acute reaction. In this case the oil was repeatedly found in the sputum. It was discovered in the lungs at necropsy in large amounts and identified, by chemical methods, as mineral oil.

REPORT OF CASE

An unmarried business man, forty-seven years of age, entered the hospital on August 26, 1928, complaining of

Fig. 2.—Left lung viewed from behind after making a coronal section through the long axis of the lung. The emphysematous upper lobe is seen at the left and the collapsed and solidified lower lower at the right. The upper part of the primary fissure is not obliterated. The area of collapse and the zone of reaction in the lower lobe are apparent. Note the thickened pleura over the lower half of this mass.

malaise, a slight nonproductive cough, and fever. The family history was irrelevant and his past health had been good. The patient, who was nervous and irritable in disposition, had been distressed for the preceding six months by a mild chronic irritation of the nasopharynx and larynx. He had been under the care of an otolaryngologist, who had treated him by the local application of liquid petrolatum, which contained 0.2 per cent of both camphor and menthol. Within two weeks preceding hospital entry, an acute bronchitis had been treated with ten intratracheal instillations of the same oil. This oil was warm when injected, and each dose was of four or five cubic centimeters.

Fever and cough were noted upon physical examination, together with diminished resonance and bronchovesicular breath sounds over the right lower lobe. Dyspnea and cyanosis were evident, but no râles were heard. Repeated examinations of the urine revealed no abnormalities; the blood exhibited only a slowly increasing leukocytosis which reached a peak of 18,250 per cubic millimeter. A blood culture, Widal, and blood Wassermann were all negative. No sputum was available until in October, at which time no tubercle bacilli were found. No examination for oil in the sputum was made at this time.

The first roentgenogram upon August 31, 1928, showed an increase in the density of the mesial portion of the lower left lobe between the hilus and the left base, and an increase in the density of the entire lower right lobe of the lung. The upper margin of the involved lower right lobe was sharply delineated, and above this the lung fields were normal in density. In the involved areas there was an accentuation of the finer lung markings, which extended to the periphery of the lung fields. The greatest density was shown in the vicinity of the cardiohepatic angle.

Convalescence was slow, the temperature approaching normal only by the sixteenth day of hospital treatment.

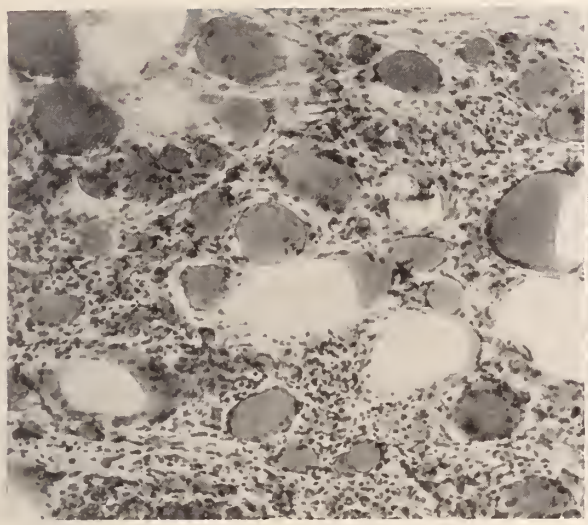

Fig. 3

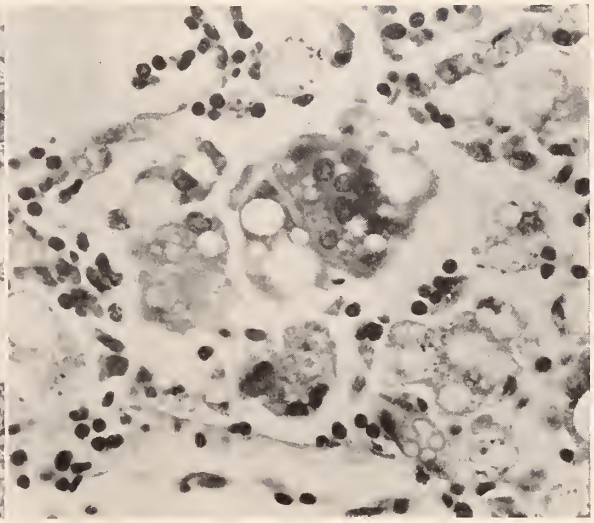

Fig. 4

Fig. 3.—Low power photomicrograph of frozen section of lung stained with Scarlet R. The alveoli are filled with masses of stained oil, some of which escaped in preparing the sections. Fibrosis and leucocytic exudation are apparent.

Fig. 4.—High power photomicrograph of mediastinal lymph node showing phagocytic cells accumulating in the peripheral sinuses. There is considerable carbon in addition to the oil vacuoles. Many giant cells have been formed.

He was discharged on November 29, 1928, in fairly good condition and without respiratory symptoms. The unusual shadows persisted in the roentgenograms of the chest. During the following four years he was able to attend to his business affairs, but suffered from frequent respiratory infections. No oil was used in the treatment of these later infections. He aged rapidly in appearance, but lost weight and strength very slowly.

In May, 1932, after a "cold" he developed a severe cough with the production of large quantities of sputum. This sputum was examined repeatedly and was always purulent, of a grayish-green color, and occasionally blood-streaked. Tubercle bacilli were never found, but all sputum specimens were remarkable for the constant presence of numerous free oil droplets. These were uniform in size, about twice the diameter of a red blood cell, and were estimated at about 100 to 150 per high-power field. Cultures for the pathogenic fungi were negative. During this exacerbation of symptoms there was dullness over the right base, and numerous coarse and medium crepitant râles were heard over the lower two-thirds of the right lung and also over the left base.

The cough and sputum production continued almost unabated for the following five months, but there was no fever or leukocytosis. The dullness which had been present over the base of the right lung disappeared, and was slowly replaced by hyper-resonance which extended up to the tip of the right scapula. No more râles were heard, and the breath sounds became normal in quality.

A series of roentgenograms, made in 1928 to 1934, showed the lower lobes of the lungs gradually retracting until, in the roentgenogram made on November 26, 1934, they persisted only as dense remnants lying near the mediastinum. In this film there was noted a relative translucency of the right lung field, due to compensatory emphysema of the right upper lobe. (Fig. 1.)

During the spring of 1934 the patient continued to improve and, in the absence of all respiratory symptoms, regained his normal weight and a fair amount of vigor. In spite of the long duration of the pulmonary disorder, there was no clubbing of the fingers. In April, 1935, another acute respiratory infection occurred, and on April 19 he suddenly developed pulmonary edema with marked cyanosis. There was little response to treatment, death occurring after eight hours. The clinical diagnosis was bilateral oil tumors of the lungs resulting from the intratracheal instillation of liquid petrolatum six years and eight months previously.

Necropsy:

The following observations are taken from the necropsy protocol.

Gross Description of Lungs.—The upper lobes of both lungs were pale and soft and had glistening pleural surfaces. They were markedly emphysematous anteriorly, and moderately edematous along the posterior margins. An oval mass was present around the hilar region at the base of each lung; the right measuring 6 by 6 by 5.5 centimeters, and the left 14 by 8 by 8 centimeters. These masses were hard and rubbery, and had ragged, scarred surfaces where they had been densely adherent to the parietal pleura.

Cut sections of the mass on the right revealed two oval nodules, each 5 by 3 centimeters, circumscribed by tough fibrous capsules 2 to 4 millimeters in thickness, and adherent to each other, to the diaphragm and to the adjacent surface of the upper lobe. It was subsequently demonstrated, by dissection of the bronchi, that these nodules were the remnants of the lower and middle lobes of the right lung. The capsules represented the former pleural surfaces. The tissue exposed by sectioning was solidified except for a crescent-shaped rim of spongy lung parenchyma at the upper margin of the mass. The cut surface was grayish black in color, mottled by many irregular solitary and conglomerate caseous zones which varied from 0.1 to 1.0 centimeter in diameter. The grayish tissue was firm and rubbery in consistence. When it was squeezed, droplets of a clear, viscid, greasy substance collected on the surface. This substance floated when placed in water.

Cut sections of the mass on the left revealed a single nodule, demonstrated by dissection to be the lower lobe. (Fig. 2.) The appearance of the solidified portion was similar to that of the lesion in the right lung. The mediastinal lymph nodes were enlarged and had a greatly cut surface.

Microscopic Description.—The white caseous areas were necrotic and structureless. In the gray solidified areas there was a reduction in the size of the air sacs and many were obliterated. The alveolar epithelium was retained in places and the air spaces were filled with vacuolated macrophages. Elsewhere the alveolar lining was replaced by a collar of phagocytes, which encircled large vacuoles that occupied an entire alveolus. The alveolar walls were greatly thickened by nodules or lymphocytes and infiltrations of vacuolated macrophages. The connective tissue was increased in quantity, and was dense and hyaline in areas where alveoli seemed to have been obliterated.

COMMENT

The vacuoles in the lung tissue and phagocytic cells were spaces formerly occupied by soluble material which had been removed in the preparation of paraffin sections, but in frozen sections,

stained with Scarlet-R, this material was retained and was stained bright red (Fig. 3).

There was a marked foreign body reaction in the mediastinal lymph nodes (Fig. 4). The lymph sinuses were filled with phagocytes, among which multinucleated giant forms were numerous. These cells were heavily laden with globules of foreign material and fine granules of carbon pigment.

Occasional small collections of foreign-body giant cells containing numerous globules were found in the malpighian bodies of the spleen.

Chemical Identification of the Oil.—A specimen of oil was obtained from the mass at the base of the left lung, partly through expression and partly through ether extraction. About five cubic centimeters of oil were obtained from approximately one-fifth of this single tumor mass. The saponification number was found to be practically zero. No glycerol was present. Thus, since the oil was neither of vegetable nor animal origin, it was necessarily mineral oil.

All oils cause an inflammatory reaction when they gain entrance within the alveoli. The most severe reactions are caused by oils of animal origin, as fish-liver oils, probably because an enzyme is present in the lung to cause hydrolysis and the liberation of fatty acids. Thus, lipoid pneumonias, following the aspiration of butterfat and cream in vomitus or during gavage, are quite severe. The oils of vegetable origin, with the exception of chaulmoogra oil and certain specimens of olive oil containing high percentages of free fatty acid, call forth but little reaction.[9,13] This is presumably due to the absence of an enzyme within the lung tissue to facilitate the hydrolysis of vegetable oils. For this reason, if an oil must be used as a vehicle for medication, it is best to choose an oil of vegetable origin.

Mineral oil or liquid petrolatum stands in an intermediate position. It is, of course, chemically inert and acts only as a foreign body, but does produce inflammatory changes, phagocytosis and subsequent fibrosis. Most of the reported cases of pulmonary oil injury are clearly due to the presence of this oil within the alveoli.

REPORTS IN THE LITERATURE

Fatal pulmonary oil damage has been reported in infants from the use of plain liquid petrolatum dropped into the nose, or given by mouth.[2,4,6] When drugs such as menthol are added to the mineral oil, as in the too frequently used "nose drops," it is believed that the local anesthetizing effect of the menthol facilitates the entrance of the oil into the trachea.[12] In other cases fish-liver oils have been given by force, and aspirated during the child's struggles. In patients with serious disease of the central nervous system, careless use of the gavage tube has introduced butterfat directly within the trachea. The same result has followed the aspiration of vomitus in cardiospasm.[16] All the above accidents can occur in irrational or comatose adults. In addition, fatal injury has been reported in adults from the long continued use of nasal sprays and drops. Prolonged self-medication of this type seems to introduce the greatest quantity of mineral oil. There are patients, some suffering with atrophic rhinitis, and others with an apparent neurosis, who complain of a dry sensation within the nose, and who obtain transient relief by the constant use of large quantities of either plain or medicated mineral oil. The subsequent lung lesions frequently go undiagnosed, or are misinterpreted as tuberculosis from the history and roentgenogram.

THERAPY

As therapeutic measures are relatively ineffective after oil has entered the lung, the physician's chief duty is to *prevent* lung injury from oil aspiration. This may be done by using great care in the feeding and medication of sick infants, and in adults with serious disease of the central nervous system. Force should never be used in the administration of fish-liver oils. The direct intratracheal instillation of liquid petrolatum should be abandoned. The ever-present "nose drops" are not safe for routine therapy, for some patients develop a habit of prolonged self-medication. If it seems necessary to carry a drug to the nasopharynx in an oily solution, it would appear safer to use a vegetable oil which does not contain free fatty acids.

DISCUSSION

DEAN E. GODWIN, M.D. (820 Professional Building, Long Beach).—The Program Committee invited Doctor Houck to present this subject before our section because it was felt that the importance of this danger has not been sufficiently emphasized to the otolaryngologist.

Doctor Houck has presented his subject well, and we are indebted to him for stressing the dangers of this condition. When he states that the condition is terminal, as a rule, in the infant, and frequently fatal in the adult, we should each think how much we personally have contributed to this danger among our patients.

Many otolaryngologists routinely prescribe oily sprays; many pediatricians frequently prescribe plain or medicated liquid petrolatum for instillation in infants' noses by a medicine dropper. Too many laymen think that if a little medicine is good, more is better, and use these oils much more freely than the physician intends.

Doubtless there are many more cases of this condition than have been diagnosed or suspected. The carefully worked-out case presented by Doctor Houck is startling in its findings, but is only an example of what may be going on in some of our patients.

It behooves us, then, to carefully weigh the dangers of indiscriminate nasal or intratracheal instillations of oil or the careless prescribing of oily medicaments to our patients.

CIGARETTE SMOKING*

ITS EFFECT ON THE VOLUME AND ACIDITY OF THE GASTRIC JUICE, WITH PARTICULAR REFERENCE TO DUODENAL ULCER

By HAROLD ROSENBLUM, M.D.
San Francisco

DISCUSSION *by Arthur L. Bloomfield, M. D., San Francisco; Allan L. Cohn, M. D., San Francisco; Harold Lincoln Thompson, M. D., Los Angeles.*

THE medical literature contains frequent references to the proscription of tobacco smoking in the management of patients with peptic ulcer. This attitude has been derived largely from clinical observation, and has been handed down by authorities whose opinions have been considered worthy of respect and repetition. Many distinguished medical writers [1-4] have maintained the belief that tobacco smoking may aggravate the symptoms of peptic ulcer, or, further, that smoking may predispose to this disease.

Comment has been made, notably by Trowell [5] and by Johnson,[6] that such opinions have been held in spite of the absence of scientific proof that the smoking of tobacco is harmful to patients with ulcer.

It has been shown [4, 7] that the inhalation of tobacco smoke by smokers has an appreciable effect on the peristaltic contractions of the stomach, as demonstrated by kymographic registration. This effect is evidenced by a period of hypercontractility which continues for about fifteen minutes after the beginning of the inhalation of cigarette smoke, and which is followed by a 45-minute period of atony.

The volume and acidity of the gastric juice of patients with functional and with organic gastrointestinal disease have been studied by Gray.[8] His findings indicated a variable response to tobacco in the patients with functional disease. In patients with duodenal ulcer, smoking was usually followed by an increase in the volume of gastric juice which was associated, although not constantly, with increase in its acidity.†

Skin-testing of patients with peptic ulcer for allergic sensitivity to tobacco or its extracts has shown no significant relationship.[8-12]

Search for a statistical correlation between the habit of smoking tobacco and the incidence of peptic ulcer has been productive of only negative results by investigators in both England [5] and America.[13] No etiological relationships could be discovered by this method of study.

PROBLEM AND METHOD

The present study was undertaken to determine the immediate effect of the smoking of a single cigarette upon the acidity and volume of the gastric juice of fasting patients with and without peptic ulcer. Conditions of the experiment were controlled so that comparison could be made between the "ulcer" and "non-ulcer" groups. The effect of the tobacco was compared with the response produced by the subsequent administration of a dose of alcohol adequate to produce definite increase in the acidity of the gastric juice.

The following technique was used:

The patients to be used as subjects for the experiment had been instructed to abstain from eating, drinking, and smoking for at least twelve hours preceding the test, which was started at 8:30 a. m. A Rehfuss tube was introduced into the patient's stomach, and all gastric contents were removed, mixed, measured for volume, and were then reintroduced through the tube into the patient's stomach, save for 10 cubic centimeters which were retained for chemical examination.‡ The subject was then asked to smoke a cigarette, using any popular American brand. Twenty minutes after smoking was begun, all of the gastric content was aspirated for examination. Fifty cubic centimeters of 7 per cent ethyl alcohol were then instilled through the tube, and at the end of twenty minutes 10 cubic centimeters of the gastric juice were removed for study. The total volume of the gastric content was not determined at this stage, the last specimen being used only for determination of acidity. The possibility that an effect might be produced by the passage of the tube and the reinjection of gastric secretion was controlled by study of a group of patients in whom these procedures were

* From the Departments of Medicine of the Mount Zion Hospital and of the University of California Medical School, San Francisco.

Read before the General Medicine Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

† Since this paper has been in press, experiments have been reported (Bernay, P., and Faure, G.: Decaffeinized Coffee and Denicotinized Tobacco in Gastric Diet, Arch. d. Malad. de l'App. Digest, 27:865, 1937) which indicate that tobacco, including "denicotinized" tobacco, acts as a powerful stimulant to the gastric secretions as to both its acidity and volume.

‡ In these experiments the concentration of free and total hydrochloric acid in the gastric juice was expressed in terms of the number of cubic centimeters of tenth normal sodium hydroxid (stated in the text as degrees of acidity) necessary to neutralize 100 cubic centimeters of gastric juice, using dimethyl amido-azobenzol and phenolphthalein as indicators.

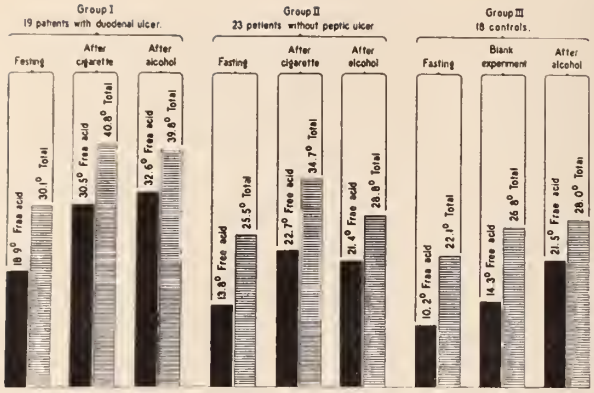

Table 1.—The response of gastric juice acidity to the smoking of a cigarette followed by 50 cubic centimeters of 7 per cent alcohol (groups 1 and 2), and to the same dose of alcohol alone (group 3). (Ewald degrees—gastric acidity.)

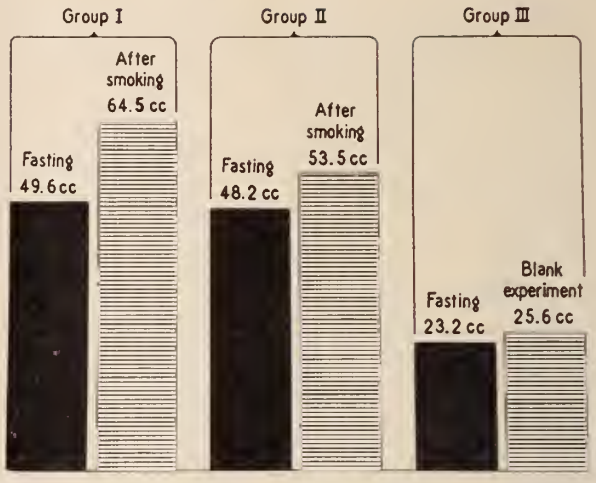

Table 2.—The fasting volume of the gastric juice compared with the volume after smoking.

carried out, but with omission of the smoking of the cigarette.

Thus, three groups were studied: (1) Nineteen patients (twelve males and seven females) with duodenal ulcer; (2) twenty-three patients (twelve males and eleven females) with miscellaneous gastro-intestinal conditions, functional and organic, but without peptic ulcer or carcinoma; and (3) eighteen patients (four males and fourteen females), similar to those in group (2) (with the exception of two who had duodenal ulcer), who were used as a control group. All patients in groups (1) and (2) were chronic cigarette smokers who habitually inhaled the smoke. No patient with gastric ulcer, Addisonian anemia, or achlorhydria after the administration of alcohol, or who had had a gastro-enterostomy, was included in any of the groups. The average age of the patients in each of the three groups was forty-three years. The total number of patients in the three groups was thirty-eight males and twenty-two females.

FINDINGS

Group 1. *Cases of Duodenal Ulcer.*—In fifteen of the nineteen patients with duodenal ulcer, the smoking of a cigarette caused a substantial average increase in the free and total hydrochloric acid in the gastric juice. In twenty minutes following the beginning of smoking, the average free acidity rose from 18.9 to 30.5 degrees, an increment of 11.6 units. In the same period the average total acid increased from 30.1 to 40.8 degrees, a gain of 10.7 units. These changes (which can be seen in Table 1) represent increases of 61 per cent in the free, and 35 per cent in the total acid. Four patients showed little or no change. The subsequent administration of 50 cubic centimeters of 7 per cent alcohol produced practically no further increase in acidity. This stimulus, acting during the second twenty-minute period, resulted in an average rise of only 2.1 degrees of free, and a drop of 1.0 degree of total acidity. In fact, ten of the nineteen patients in this group showed less acidity, both free and total, twenty minutes after the administration of alcohol than they had had twenty minutes after beginning to smoke a cigarette. There were two instances in which lower concentrations of acid were found after both tobacco and alcohol had been used than the acidity which had been noted when the patients were in a fasting state.

In twelve cases there was an average increase in the total volume of gastric secretion from 44.5 to 72.1 cubic centimeters. In six other cases there was an average decrease from 62.2 to 54.4 cubic centimeters. In the one remaining case, in which the fasting content had measured 35 cubic centimeters, there was no change in volume. The average volume of the gastric juice in the entire group of nineteen patients with duodenal ulcer, was found to have increased after smoking from 49.6 to 64.5 cubic centimeters (Table 2). When it is remembered that this large volume of gastric juice also had a higher concentration of acid, it becomes apparent that the increment represented by greater volume and higher acidity is considerable.

Group 2. *"Non-ulcer" Cases.*—Twenty-three patients with miscellaneous gastro-intestinal conditions, but without peptic ulcer, were studied similarly. As before, the effect of smoking on the gastric juice was determined; and the response to subsequent instillation of alcohol was noted also. The average fasting acid was found to be 13.8 degrees of free and 25.5 degrees of total acid—which are values, of course, lower than those found in the patients with ulcer. After smoking, titration of the gastric juice showed 22.7 degrees and 34.7 degrees, respectively, of free and total acid, indicating increments of 8.9 degrees in the free and 12 degrees in the total acidity. As might be expected, the average increments were not as great as those found in the patients with duodenal ulcer, although the increases in percentage over the acidity of the fasting specimens were approximately the same as those found in Group 1. In Group 2, the rise in concentration of acid following smoking occurred in fifteen of the twenty-three patients. There were three cases in which the degree of acidity was not affected; and five others in which slightly lower values for acidity were found after smoking (Table 1).

The effect of smoking on the total volume of gastric juice was negligible, the average gastric content decreasing from 48.2 to 44.3 cubic centimeters.

As in Group 1, the administration of alcohol subsequent to the smoking period produced no further increase in concentration of acid (Table 2). The acidity twenty minutes after instillation of alcohol was, in fact, slightly less than it had been twenty minutes after the beginning of inhalation of cigarette smoke.

Group 3. *Controls.*—The eighteen patients in this group were used to study the possible effect on the gastric juice of the presence of the stomach tube and of the aspiration and reinjection of gastric contents. The smoking of the cigarette was omitted, but otherwise the experimental procedures were the same as those used with Groups 1 and 2. The administration of alcohol was included so that its effect on patients who had not smoked previously could be compared with its effect on the other groups. In Group 3, the average values for free and total acid in the fasting state were 10.2 and 22.1 degrees, respectively. After aspiration and reinjection, but without smoking, the values (Table 1) were 13.4 and 26.8, respectively. This lack of any material change was, however, in marked contrast to the brisk rise in acidity, following the instillation of alcohol, to levels of 21.5 of free and 28.0 degrees of total acid. Determinations of the volume of the gastric secretion (Table 2) showed no appreciable change following the control experiment.

CONCLUSIONS

1. Cigarette smoking by patients in a fasting state produced a significant average increase in the free and total acidity of the gastric juice in a group of nineteen patients with duodenal ulcer; and, to a somewhat less extent, in a group of twenty-three patients without duodenal ulcer.

2. The magnitude of the average increase in acidity after the smoking of tobacco was such that the subsequent administration to each patient of 50 cubic centimeters of 7 per cent ethyl alcohol produced no further rise.

3. A control study of eighteen patients was made, with the smoking omitted from the procedures; and in these patients the gastric acidity was not materially increased until after the instillation of alcohol, when definite increases in acidity were noted. This makes it clear that the response obtained in the first two groups was truly attributable to the use of tobacco.

4. A significant increase in the volume of gastric juice following smoking was found in the group of patients with duodenal ulcer. In these patients the average volume rose from 49.6 to 64.5 cubic centimeters, an increase of 30 per cent.

5. The clinical observation that the smoking of tobacco has an unfavorable influence on the condition of patients with peptic ulcer finds confirmation in the experiments reported above.

DISCUSSION

Arthur L. Bloomfield, M. D. (Stanford University Medical School, San Francisco). — Doctor Rosenblum's interesting observations seem quite definite, but there would appear to be some question as to his conclusion that, because acid increases after cigarette smoking, it is therefore necessarily harmful to patients with peptic ulcer. Furthermore, we have had some different results in studying gastric secretion in peptic ulcer cases. With duodenal ulcer, for example, the basal gastric acidity without any stimulus averaged in our series 95, and even when the powerful stimulus of histamin was added to this, there was relatively little further increase.

We are somewhat skeptical as to the adequacy of Doctor Rosenblum's method of attacking his problem, especially as regards returning the aspirated gastric juice to the stomach. Another procedure would seem to be to get a curve of the basal secretion over an hour or so, and then, on the following day, to repeat the test on the same patient while smoking.

Allan L. Cohn, M.D. (450 Sutter Street, San Francisco).—Doctor Rosenblum's conclusions, based on accurate scientific observation, can bear the scrutiny of critical analysis. His work confirms, by scientific experimental proof, the beliefs and suspicions held for many years by clinicians that tobacco smoking is detrimental to the healing process of peptic ulcer.

Several points that he brings out merit analysis and discussion.

Proof has been presented in his series of ulcer cases that there is a definite increase in volume and acidity of the gastric secretion. But he has also shown that in his Group II there is approximately the same percentage of acid increase. Group I shows an increase of 60 per cent in free acid; Group II, a 64 per cent increase. Group I shows a 35 per cent increase in total acid, and Group II a 36 per cent increase.

From these figures it might be inferred that the use of tobacco has the same effect in nonulcer cases with gastric symptoms as in peptic ulcer cases. I wish to question this point. My criticism here is not directed so much to the conclusion as it is to the content of the premise. I desire to

raise the question: Does Group II consist only of nonulcer cases? If so, the conclusion would be logical.

From my recent observations with Schindler at the Billings Hospital, Chicago, and from my own experiences with the new flexible gastroscope, I believe we shall be compelled to revise, for purposes of classification as well as treatment, our ideas of what constitutes functional gastric disease. I am quite convinced that there exists a large group of so-called functional gastro-intestinal cases which can be shown to have mucosal ulcerations, and/or a type of gastritis which can be proved only by direct visualization of the gastric mucosa. These cases should be classified at present in Group I for purposes of this experiment, and not in Group II. If Group II, as amended, would still show the same percentage increase in acid, then only might one logically conclude that cigarette smoking causes the same percentage increase in gastric acidity, in gastric functional, and in peptic ulcer cases.

The importance of the work of Lickint, and of Danielopoln Simici and Dimitrin, referred to by Doctor Rosenblum, should be emphasized. They showed that inhalation of tobacco smoke causes, in smokers, gastric hypermotility. The use of a control group of smokers with normal stomachs, in Doctor Rosenblum's experiments, might have correlated these findings as regards acidity. This same group could also have shown the comparative effect of tobacco smoking by normals as against smoking by ulcer patients. The question would then arise, if there is a difference, is it due to the gastric pathology present? If no difference could be shown between the two groups, could we say that the increased acidity is an essential nicotine effect, or an effect due to some other factor present in the smoking process? The recent observations of Mahlo, as described in *Deutsche Medicine Wochenschrift*, 62: 1216, 1936, would lead us to the belief that the increase in acidity in Doctor Rosenblum's cases is not due to the effect of nicotin on the gastric pathology present. Mahlo contends that nicotin is not absorbed by either acid or alkali gastric mucosa, and has no effect on the lining epithelium of the stomach. It is absorbed, he says, in other organs and exerts its effects in the stomach through the splanchnic nervous system.

One of the most interesting facts presented in this paper is that the administration of alcohol subsequent to the smoking period produced no further increase in concentration of acid. The knowledge of this fact by an ulcer patient who, having persisted in smoking, wishes also to return to alcoholic indulgence, could in itself lead to a very interesting discussion between patient and his medical adviser.

This paper presents many problems for further investigative work, and it is hoped that Doctor Rosenblum will continue his study.

❦

Harold Lincoln Thompson, M. D. (1930 Wilshire Boulevard, Los Angeles).—Doctor Rosenblum has ably presented a paper on a subject of importance to those interested in the physiology of the stomach and duodenum, and in peptic ulcer. I have been interested in problems of gastric secretion, with particular reference to the surgery of the stomach, for a number of years.

In an interpretation of the results of Doctor Rosenblum's study, one must recognize the three phases of gastric secretion, namely, cephalic (psychic), gastric, and intestinal. Doctor Rosenblum has stated that all patients in his test group were chronic cigarette smokers. Since gastric and intestinal phases of gastric secretion for all practical purposes were excluded by the conditions of this study, the observer has dealt only with the cephalic phase of secretion. The response which the author observed in his experiments was conditioned in all instances by an appetite for cigarette smoking. It would be interesting, therefore, to know the reaction in a similar group of nonsmokers as a further control on the author's observations.

I believe that in these experiments the other phases of gastric secretion are relatively unimportant, excepting in so far as the subject may have swallowed saliva or mucus, thereby slightly neutralizing the gastric content. I hope that the author will favor us with a subsequent report on the observations on similar groups of patients who are not chronic cigarette smokers.

PHYSICS: ITS APPLICATION TO ROENTGEN THERAPY*

By Robert E. Pugh, Jr.
Pasadena

Discussion *by Kenneth S. Davis, M. D., Los Angeles; John D. Lawson, M. D., Sacramento; George Stevenson Sharp, M. D., Pasadena.*

THE magnitude of roentgen therapy dosages is expressed in terms of the "r unit," which is merely a unit of quantity of radiation analogous to the "milligram" used for expressing the dosages of pharmaceuticals. It was originally defined in the interests of universal duplication by physicists rather than in terms of any physiological or biological reaction. Although its magnitude is arbitrary, its use in expressing relative quantities of radiation is not limited by this fact. Changing of the size of units expressing a certain quantity does not influence the magnitude of the quantity itself, if the number of units is changed to compensate for the change in size. For example, in the case of drugs; if the gram were the usual unit instead of the milligram, obviously the number of units required for a given quantity would be just 1/1000th the number required in terms of milligrams.

NEED OF A UNIVERSAL UNIT

It should also be pointed out that the magnitude of successful dosages, in terms of r units, were determined clinically by radiologists and clinicians, physicists having had no direct influence on the choice of such values. Roentgenologists have recognized the position of the physicist as advisor and aide in applying physical principles to these dosages, but other physicians need have no fear that the dosages themselves have been tampered with by nonmedically trained men. The same clinical or biological dosage could be expressed in any units without altering its biological effect; the important point is to choose the units so that they may be easily and universally duplicated. It appears to be desirable that the dosage be expressed in terms of a universally understood quantity, rather than in terms of some degree of biological reaction which is incapable of exact description and duplication.

DEFINITION OF THE R UNIT

The official definition of the r unit has been given in the literature many times, but for the purposes of this discussion such a formal definition may well be omitted, and attention rather directed to the fact that it is merely a unit of quantity of radiation, just as the milligram is a unit of weight of material. More universal understanding of this fact should lead to greater confidence in roentgen therapy, and less confusion in the concepts of dosage.

It so happens that the magnitude of the r unit which was chosen is such that, in the present state of the science of therapy, most dosages fall within the range of 50 to 5,000 r units. Because of the way in which it is defined, the r unit (or intensities

* Read before the Radiology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–5, 1937.

in terms of r units) may be determined directly by means of the standard open-air ionization chamber. Thimble-type ionization chambers, especially useful for surface and depth measurements, may be calibrated by comparison with the standard air chamber and used as secondary standards.

FUNCTION OF THE X-RAY PHYSICIST

The function of the x-ray physicist should be properly to measure the x-ray output of the equipment in r units so that the dosages will be reported in identical units throughout the world. Clinical medicine is burdened with too many other variables by nature not to eliminate variation in units when it is possible. If the dosage is so measured, then variations in clinical response may be assigned solely to individual variation or different pathological conditions. Calibration of intensity is essentially the same sort of standardization as the United States Pharmacopeia standards of concentration in pharmaceuticals. It is evident, then, that the calibration of the output in r units is not, in itself, any guarantee of successful clinical therapy. The deciding factor must always be the skill of the therapist in applying the experimentally determined dosages to the particular pathological problem at hand.

CHECKS ON THE OUTPUT INTENSITY

It is necessary to measure the output at such intervals that the roentgenologist may be continually confident that his dosages are being delivered exactly as planned, and have not varied due to possible mechanical and equipment variability. Variations in output seem to be due principally to changing characteristics of the x-ray tube itself. Sometimes such changes occur, sometimes not, but periodic measurement in r units will detect such changes or verify the constancy of output.

The x-ray machine control settings for obtaining a given kilovoltage actually select the desired fraction of the supply-line voltage to apply to the primary of the x-ray transformer. Occasionally the line voltage may change or fluctuate, in which case, although the selected fraction remains the same (for the same control setting), the magnitude of that fraction of the line voltage will be different, resulting in different kilovoltage on the x-ray tube and different output intensity. To avoid this variable factor, the indication of the primary voltmeter or kilovoltmeter should be relied upon rather than the control setting values. If the line voltage varies, the controls should be changed so that the voltmeter reading is the same as before.

Needless to say, all the factors of the technique chosen must be exactly determined to avoid error; differences in filter and distance are especially to be avoided to eliminate serious mistakes in dosage. It is only by using accurate dosage that the effectiveness of different techniques may be evaluated and the state of the art advanced.

MECHANICS OF ROENTGEN RADIATION

The mechanics of roentgen radiation is essentially a branch of the science of physics, but the application to medical uses is, of course, a specialty of medicine. The physicist, however, may point out certain fundamental principles governing the action of the radiation to aid the physician in applying this tool to his particular purpose.

The radiation emitted by an x-ray tube is of the same character as radio waves, heat and light; the essential difference lies in the wavelength of the radiation. The degree of penetrability of x-rays through opaque material is a function of the wavelength, which, in turn, is a function of the voltage applied across the x-ray tube. In general, the higher the voltage the shorter the wavelength, and the more penetrating the radiation. However, the radiation emitted at a given voltage does not consist of a single wavelength, but rather of a mixture; the peak kilovoltage determines the shortest wavelength, or most penetrating, component of this mixture.

BODY ABSORPTION OF THE BEAM

The longer, less penetrating components of this beam will be absorbed by the first layers of material placed in their path. This first layer may consist of the superficial skin layer of the patient, or it may consist of a metallic filter placed in the beam near the tube. If the skin absorbs these long wavelength rays, then a visible physiological reaction will appear (after an interval of some days), with less total radiation than if metallic filters had removed them before reaching the patient. Such is the case for superficial skin therapy. If a filter is used, the shorter wavelength radiation passing through the filter will not be as readily absorbed by the skin, and a greater total quantity of this filtered radiation may be administered before (after a certain interval) a visible skin reaction will appear. This is the reason for the observed difference in the total dose in r units required to produce an erythema with various qualities of roentgen radiation.

The greater the filtration (up to a certain point) the more nearly will the mixed beam be reduced to a single wavelength (homogeneous radiation), and the more uniform the dosage throughout the depth of the tissues. Similarly, the higher the peak kilovoltage the shorter will be the homogeneous radiation emerging after this optimum filtration. It now becomes evident that it is the physical phenomenon of absorption, in one form or another, which determines the choice of technique for different types of therapy.

In general low voltage, unfiltered radiation is considered more suitable for skin therapy, and in this case the skin absorbs the long wavelength components. High voltages (200 kv.) or supervoltage (above 250 kv.) are usually used for the treatment of deeply situated lesions (deep therapy), and in this case metallic filters are used to eliminate the long wavelength components, thus sparing the skin to a certain extent.

When the beam of radiation is incident upon the tissues of the patient's body, a certain amount of the radiation which penetrates below the surface is scattered by the atoms composing the tissue. By repeated scattering, a part of this scattered radiation finds its way back out through the same skin area exposed to the incident beam from the

x-ray tube. The total dosage to which this area of skin is subjected is then the sum of the incident radiation from the tube and the back-scattered radiation. The amount of scattered radiation is dependent upon the size of the area irradiated, as well as the quality of the radiation. For larger areas the backscatter is greater, and the exposure time required for a certain dosage will be less than for a small area, where the contribution of backscatter to the dose is negligible.

DEPTH DOSAGE

Depth dosage is the relative quantity of the radiation present at the surface which penetrates to a given depth in tissue. Usually the depth dose is expressed in the percentage of skin intensity, which reaches a depth of 10 centimeters, both the surface and depth measurements, in this case, including scatter. In general, the shorter the wavelength of the radiation, the greater the depth dose, although it is also dependent upon the size of the field irradiated.

The distance of the source of radiation from the skin surface is another important factor in determining the choice of therapy technique, because the depth dose is also a function of this variable. The greater the source to skin distance the greater the depth dose. The low depth dose associated with surface radium applicators is utilized to limit the radiation effects to the surface layer involved in a skin lesion. For deep therapy, a reasonably long target-skin distance seems desirable for attaining the maximum depth effect for a given skin tolerance.

BACKSCATTER NOTATIONS IN THERAPY REPORTS

Because the amount of scattered radiation measured on the surface varies with the type of instrument used, and the underlying architecture of the anatomical part being irradiated, it seems advisable to report dosage values as measured in air, without backscatter. In any case, it is extremely important to state plainly in therapy reports whether the dosage values do or do not include backscatter. It is evident that gross errors might result from confusion regarding this point, since the amount of backscatter often exceeds 30 per cent of the primary beam. The size of the field irradiated should always be stated, and the total dosage for each area should be specified. The period over which the series of treatments extended is also necessary for a complete description of the technique.

The quality of the radiation should be carefully reported, giving both the kilovoltage and the filter used; the filter data should include both added filter and the inherent filtration of the tube, casing and fittings. The best single value available at present for describing the quality of the mixed beam is the half-value layer of some specified material, usually copper. This is the thickness of the material necessary to reduce the intensity to half its original value. Another term, the effective wavelength, is often used, but, since it is usually determined from half-value layer measurements or the equivalent, it seems best to use the original data.

The phenomenon of scattering is also important from the standpoint of the protection of the operator. Even though the equipment is completely rayproof as far as the primary beam is concerned, the operator is exposed to the radiation scattered from the patient's body, and must be shielded accordingly.

Since the depth dose percentage measured with low voltage radiation is relatively low, and much less than for high voltage roentgen rays, it is impossible, even by prolonged treatment, to obtain adequate irradiation of a deeply situated lesion. By trying to accomplish this end valuable time is lost, during which the course of the disease progresses until it may be too late for proper deep therapy to be of any help.

ACTUAL DOSAGE RECEIVED BY THE TUMOR

The important consideration for therapy is the actual dosage received by the tumor. This may be calculated from depth dose data by adding the radiation received at the locus of the lesion from all the portals of entry used. Multiple ports ("cross-firing") permit a higher tumor dose to be built up than would be possible with one field, due to the limitations of skin tolerance. A safe dose, however, may be given to several skin areas with the beam properly directed, so that the lesion at a depth receives the sum of the radiation from all the ports of entry.

It has been recommended by the Standardization Committee that the therapist maintain a day book for recording all changes in equipment, tubes, calibrations, and other pertinent data. It was also suggested that individual treatment records be initialed by both therapist and technician, as a check for legal purposes, on such factors as filter, target-skin distance and dose administered.

SUMMARY

1. The r unit is a unit of quantity of radiation; dosages in terms of r units have been clinically determined.

2. Calibration of intensities in r units permits exact duplication of successful dosages and a universal basis for comparison.

3. The long wavelength component of radiation is absorbed either by the patient's skin or by a metallic filter. In the latter case the skin is spared to a certain extent and a greater amount of radiation is delivered to a depth before a skin reaction is evoked.

4. Backscatter, varying with the size of the area, contributes to the skin dose, and must be taken into consideration.

5. Dosages should be reported in air, without backscatter, together with the size of the field and the target-skin distance. Quality should be specified by voltage, filter (including inherent filter), and half-value layer in copper.

6. Protection against scattered radiation is necessary for the operator.

7. Tumor dosage may be increased by using several portals of entry, and not exceeding the desired skin dose for any one area.

8. Certain records should be kept for legal protection.

1944 Summit Avenue.

DISCUSSION

KENNETH S. DAVIS, M.D. (St. Vincent's Hospital, Los Angeles).—Careful consideration of Mr. Pugh's paper brings out the fact that everyone doing x-ray therapy, whether a radiologist or otherwise, should utilize the services of an x-ray physicist to properly calibrate the machine that is being used for therapy. The physicist should be expected to accurately measure the output of the x-ray machine in r units, so that the dosage reported will be in such terms as can be understood by anyone doing x-ray therapy. The physician doing such therapy should bear in mind that the *allowable* dosage of x-rays depends on a number of factors:

1. The kilovoltage used.
2. The kind and the amount of the filter.
3. The size of the treated area.
4. The distance from the target of the tube to the skin of the patient.

He should also realize that there is a variability in the output of an x-ray machine from day to day, and that changes of any part of the apparatus, especially the x-ray tube, will influence the output of x-rays by a matter of as much as 5 to 10 per cent, all other factors remaining the same. For these reasons the periodic calibration of the x-ray therapy machine is essential.

At this point the duties of the physicist cease and those of the physician begin, for the physician must translate this physical knowledge into terms of biologic reaction; *i. e.*, the response of the tumor cells, and the *normal tissue cells surrounding them,* to a given dosage of x-rays correctly measured in terms of r units. Each case presents itself as an individual problem to the x-ray therapist, both as to the methods of therapy employed and the biologic response. The location of the tumor, the type of tumor cell, and many other facts will influence the treatment technique used.

Mr. Pugh states that dosages should be measured and reported in air without taking into consideration the back-scatter. I disagree with him on this point, as I find so much variability in the intensity of the radiation in the differently sized portals that it would seem wise to make this a matter of record. The back-scatter in our laboratory is determined by the use of the victoreen ionization chamber half-buried in a paraffin block, each size of the portals used in our work being calibrated once a month.

However, the r per minute in air is also recorded on our treatment chart for purposes of comparison with the records in other x-ray therapy laboratories.

❦

JOHN D. LAWSON, M.D. (1306 California State Life Building, Sacramento).—Certainly, the association of the physical and biological facts pertaining to radiotherapy is essential.

Until the relatively recent perfection of physical mensuration of radiation energies, and the adaption of an international unit of measurement, dosage was discussed in indefinite terms of "erythema doses." The variation of an erythema dose between two radiologists might be 50 to 75 per cent. Hence, each radiotherapist was a law unto himself, and comparative studies could not be made.

The point made by the writer, that "there should be no confusion between the biological result and physical measurement," should be stressed. Certainly, the same dosage (in roentgens) of heavily filtered radiation will manifest itself differently from an unfiltered application.

So, too, the various factors of kilovoltage, rate of administration, location of portal, size of portal, and many other factors require the knowledge of biological application on the part of the radiotherapist.

The assistance of the physicist has been great to the radiologist, but his purely physical measurement cannot in any way displace the detailed biological knowledge of the physician who has learned from observation and study the application of these measurements in the treatment of pathological conditions.

❦

GEORGE STEVENSON SHARP, M. D. (605 Professional Building, Pasadena).—This excellent paper by Mr. Pugh should be studied by every physician who employs radiation in any of its various forms. The basic factors of x-ray and radium therapy have been clearly defined, and a detailed check of the factors, recorded habitually, will promote more scientific treatment.

Knowledge, experience and judgment of radium and x-ray therapy are assumed qualities of a therapist in this specialty. Knowledge of dosages is essential, but the radiologist must know his equipment as any artist must know his instrument. Complete information must be available on the output of his machine. He may obtain this instantly by one of the various dosimeters, or by consulting a physicist at least every two months in order that mechanical or equipment variables may be known.

Knowledge of the r-unit output of a machine is essential for the present-day procedures in radiation. By the multiple divided dosage technique and multiple portals, one may now deliver to a deep-seated growth more radiation than the skin over it will tolerate. There is a fair margin of safety, but not sufficient to permit these heavy dosages without accurate data on the r-unit output and the type of radiation.

The principle of tumor dosage, and lethal or cancercidal dosages, have concentrated thought on the radiation one delivers to the tumor rather than to the skin. Radiation dosages are known for certain types of neoplasms, according to size, depth and degree of invasion, and a therapist is expected to deliver that required amount without permanent damage to the surrounding tissues or the patient. The dosage may be delivered in part by x-radiation and the remainder by intracavitary or interstitial radium, but the summation of radiation by all procedures should be equivalent to the calculated or required amount for that particular growth.

Dosages for such growth destruction cannot always be given, and for such patients the treatment should be considered palliative and primarily symptomatic. Much relief of pain and obstructive symptoms in various parts of the body may be obtained by less severe and palliative measures without untoward radiation effects in the incurable cancer patient.

I agree with Mr. Pugh that the mechanics of roentgen radiation is essentially a branch of the science of physics, but the application to medical therapy is a specialty of medicine and the physician must have this data constantly available to obtain the maximum beneficial effect of irradiation procedures.

HUMAN RABIES IN CALIFORNIA*

WITH DISCUSSION OF DIFFERENTIAL MICROSCOPICAL ANATOMICAL DIAGNOSIS

By J. C. GEIGER, M.D.
AND
G. Y. RUSK, M.D.
San Francisco

DISCUSSION *by J. L. Pomeroy, M. D., Los Angeles; W. M. Dickie, M.D., San Francisco; Hyman I. Vener, M. D., Los Angeles.*

RABIES is a serious and expensive preventable disease, since the financial losses in cattle and sheep represent a not inconsiderable figure. When rabies appears in a new territory, a few scattered cases are usually followed by a sudden sharp increase in incidence of the disorder. Reaching the maximum rather quickly, the epidemic presents almost an equally sudden decreased incidence. The actual spread through the territory may be slow and steady, and is probably dependent on the number of infected dogs traveling out of the affected areas. In fact, the spread could be anticipated and prevented in contiguous neighborhoods, but the well-known and effective measures of control are gener-

* Symposium on Rabies, Pasteur Society of Central California, March 3, 1938.

ally used in an ineffective and half-hearted manner. Generally, a further handicap presents itself in those unthinking persons who desire to protect the dog and other animals against an alleged transgressor of their animal personal rights. Moreover, opinions are still openly expressed that the disease, rabies, does not exist except in the imagination of some public health officer.

ADVENT OF RABIES IN CALIFORNIA IN 1898

The disease is unique in its specific characteristics: the long incubation period, the short infectivity period with fatal termination, the usual mode of transmission—by bites—and a peculiar tendency to spend itself and become endemic. The type of spread of the disease may be noted as it occurred in California. This state remained uninvaded until 1898. Several years ago, Geiger[1-3] described the outbreak then occurring in California, reporting, in all, 1,897 positive examinations and thirty-six human cases. Evidently, the spread of rabies was continuous and rapid throughout the state. Obviously, the control of rabies in California is by no means a minor public health problem. All the human deaths might have been prevented if proper control measures were established for the animal reservoir, the dog. The presence in any community of this comparatively easily eradicated disease indicates that the community is not doing all that should be done to control the menace of rabies.

REPORT OF CASE

A typical case of human rabies is given below.

D. M., a child, age six, died of rabies on August 16. On July 17, this patient was bitten by a dog proved rabid by microscopical examination. She was badly bitten on both hands, the right hand showing a tear an inch long underneath the thumb, two punctures in the palm of the hand, and two deep punctures on other fingers. There were three punctures on the back of the hand. On the back of the left hand there was a deep cut one-half inch long, an inch tear was on the back of the middle finger, and a similar sized tear on the palm of the hand. There were a number of punctures on the back of the hand, and there was a deep tear on the inside of the ring finger. All the wounds were cauterized with carbolic acid, but over two hours after the biting. Administration of the Pasteur treatment was begun on July 19.

On August 13, four days after the completion of the treatment, the mother telephoned that the child was not well. The mother said the child had come home from school the day before, complaining of pain in the left arm from the fingers to the elbow. The arm was not tender to touch. The scar on one of the fingers was red. The temperature was 99.7, pulse 124; knee-jerks could not be obtained. There was loss of appetite. She could drink water without difficulty, but wanted only a little at a time. She was restless the night before, and cried twice.

When seen on August 14 the temperature was 103, pulse 120. The child readily recognized attendants and seemed normal. The pupils reacted but were dilated, especially the left. When offered water she seemed averse to drinking it. On persistent urging she was able to drink some with a great deal of difficulty, complaining of pain when she tried to swallow.

On August 15 the patient was highly nervous in the morning, afternoon, and night. She was very talkative, looking into space, seeming to see something with a look of terror. She would throw her arms around her mother and cry very sharply, then sob, then quiet down for a few moments. She would call for water, and when offered it she would refuse to take it. There was no real convulsion. The fact that one merely spoke to her would cause a spasm of the face, head and arms, with a jerking of the head. These paroxysms would pass very shortly, and then she would appear rational.

On August 16 the child was in a coma and died about 11:30 p. m. No autopsy was held. From the symptoms of this case there is no doubt that the cause of death was rabies, and it again points out that complete immunity, even with the intensive Pasteur treatment, is not established fast enough in some cases.

HUMAN CASES OF RABIES IN CALIFORNIA

In accordance with the records of California State Department of Public Health since 1899 to 1937, there have been eighty-six cases of human rabies in California, the greatest number occurring in 1923, amounting to eleven cases. Of these cases, thirty had some form of the Pasteur treatment.

Sixty-four had been bitten by dogs; six had had contact with rabid dogs, but were not bitten; one was bitten by a rabid cat; two gave no history of having been bitten or having known contact; twelve gave no information as to the source of the infection; one was bitten by an animal, species not given.

INITIAL CAUTERIZATION WITH FUMING NITRIC ACID

Of the total eighty-six cases, only fourteen had the wound cauterized with fuming nitric acid, and of these fourteen only nine received the Pasteur treatment, the remaining five giving no history of treatment.

PASTEUR TREATMENT

Of the thirty cases receiving the Pasteur treatment, nine had the wound cauterized with nitric acid; seven had no cauterization of any kind; six had no history of cauterization being used; four had wounds treated with iodin; two had wound treated with carbolic acid; one had wound treated with argyrol, and one had wound treated with silver nitrate.

Seventy-six per cent of the cases had an incubation period of sixty days or less, and in no case was the incubation period less than ten days, and in only three cases did it extend longer than six months.

INCIDENCE OF RABIES IN SOUTHERN CALIFORNIA

Of the eighty-six cases of human rabies, fifty-four, or 64 per cent, occurred in Southern California. As far as San Francisco is concerned, the last human case of rabies occurred in 1913, and the last positive dog was found in 1929.

Since in human cases of rabies there may be need of microscopical confirmation other than the demonstration of Negri bodies, there are submitted certain differential anatomical possibilities that may confuse the investigator. This is particularly important if other diseases, such as acute anterior poliomyelitis or encephalitis, may be prevailing in the community.

PATHOLOGY

Turning now to the pathology of rabies, that scourge that has come down through the centuries, written about by Aristotle, Xenophon, Ovid, and Virgil, elaborately treated, so far as attempts to forestall the infection are concerned, by Celsus and Galen, what we might consider as of funda-

mental importance in the pathology of the condition is the discovery by Negri of certain cell inclusions which have since borne his name. Of the various guesses as to what they might represent are the observations of Goodpasture, who considers them local degenerations of neurofibrils, particularly the eosinophilic portion of the inclusion, and that the central, more basophilic portion represents mitochondria. It has long since been demonstrated that the infection belongs in the filterable virus group; that the virus travels by way of the nerve and the affected part is the central nervous system, and there is localized, more particularly so far as the distribution of the Negri bodies is concerned, in the hippocampus, the cerebellum, the medulla, and the upper cord. Occasionally, Negri bodies may be found in the larger cells of the cortex. In regard to the Negri bodies, it has been discovered that they are quite irregular in size as they lie in the cytoplasm of the nerve cells in the street virus, whereas in the passage through animals forming the fixed virus they become smaller and more uniform in size. Associated with this acute infection one would expect and find inflammatory reactions. These consist of accumulations of lymphocytes in the Virchow-Robin spaces, especially through those portions of the brain showing the Negri bodies, forming the collars of cells so prominent not only in affections of the central nervous system due to filterable viruses, but also in many inflammatory conditions caused by well-known organisms. The affected cells sooner or later disintegrate, showing disturbances of the Nissl bodies, some evidence of neuronophagia, but little evidence of alteration in other types of glia. The pia arachnoid, likewise, shows lymphocytic infiltration, it being a question, as in many such conditions, how much of the exudate is due primarily to the effect of the virus on the pia directly and how much it represents an escape in the lymph stream from perivascular collars into the pia, but both methods seem to be functioning.

COMPARISON WITH OTHER DISEASES OF CENTRAL NERVOUS SYSTEM

For purposes of comparison, there might be reviewed other inflammatory conditions of the central nervous system due to specific filterable viruses, as well as making some reference to other forms of encephalitis.

Poliomyelitis.—In connection with poliomyelitis, when the virus reaches the central nervous system, in the great majority of cases the affection is primarily of the lumbar cord, although other portions of the cord may be affected, either primarily or as an extension. The alterations which occur are largely confined to the cells of the gray matter, particularly but not exclusively the anterior horn cells. In the early stages a few polynuclear leukocytes may occur, coincident with intense, rapid degeneration of the cells. This may be accompanied by a certain amount of hemorrhagic exudate; the condition is not due to thrombosis. About such areas of primary disintegration we again meet extensive perivascular infiltration with lymphocytes and a variable number of plasma cells. As degeneration occurs, there is a reaction on the part of the adjacent fibers as well as protoplasmic glia, and the end-result consists of a hole in the tissue, the wall of which is outlined by a layer of frayed-out gliosis. During the process of scarring a few compound granule cells derived from microglia are distinguishable. Associated with the inflammatory reaction there is extensive infiltration of the pia arachnoid, with lymphocytes and plasma cells; while at its greatest intensity near the site of greatest parenchymatous defect, it extends widely even over the cortex. Occasionally, of course, poliomyelitis more particularly affects the upper extremities or even the medullary nuclei with the same destructive activity. As a secondary result, following the destruction of the nerve cells, Wallerian degeneration occurs following the destruction of the axis cylinder; this, of course, leads to the paralyses, neuromuscular type, and to the secondary muscular atrophy and ultimate varying degrees of fibrosis.

Encephalitis.—Again, considering the various forms of encephalitis, in the epidemic type no specific cause has been demonstrated. Whatever be the clinical form, whether it be the lethargic or the more or less manic form, the histopathology and its distribution are essentially the same. Here the affection attacks the brain stem, spreading in either direction from the mid-brain. In the gross anatomy of the condition we have hyperemia, occasional petechial hemorrhages in the cord, brain stem or, in rare instances, widely spread through the substances of the hemispheres. Occasionally, in fact, massive hemorrhage occurs, simulating an apoplexy; but such hemorrhages occur in portions where apoplexy rarely occurs. The brain cells at the site of the more intense affection disintegrate, neuronophagia is observed, but the degree of cellular destruction is much less marked than in poliomyelitis. The inflammatory perivascular infiltration is essentially the same, except for the presence of a fair number of large undifferentiated mononuclear cells with clear cytoplasm, the origin of which is still in dispute. In contrast to poliomyelitis, a certain proportion of the cases of encephalitis go into a chronic stage, characterized by the individuals' going to sleep readily; or they develop a Parkinsonian tremor. This condition anatomically, although it is not explained, shows striking degenerative lesions in the black substance of Sommering, at times extending into the neostriatum and the globus pallidus. Even in these chronic stages of the disease several years after the acute episodes, various degrees of perivascular infiltration are still persistent. Some have interpreted this as being due to persistence of the infection, but it is also true that lymphocytes and plasma cells may persist for long periods at times after clinical recovery from poliomyelitis, and one doubts that the persistence of the cellular exudates bears any association to the virus concerned.

Syphilis.—To make further comparison, reference is made to the protean manifestations of syphilitic infection of the central nervous system. This may give rise to basilar meningitis with more or less perivascular lymphocytic and plasma cell

infiltration about adjacent penetrating vessels. In syphilis the relative number of plasma cells is usually more marked. In the neighborhood of gummata similar alterations are seen, and in the diffuse meningo-encephalitis or general paralysis, again in the presence of the Treponema pallidum, there is a remarkably extensive similar perivascular infiltration, combined with destruction of nerve cells, overgrowth of the fibrous glia, especially in the frontal cortex, the marked overgrowth of microglia from which, among other things, the rod cells are formed, and the occurrence of pigments phagocytized by forms of microglial cells which give the iron reaction. At least, that was the picture of general paralysis before the introduction of malaria and heat treatments. The picture has changed of late years; following such treatments the number of lymphocytes and plasma cells in the perivascular spaces has markedly diminished. There is evidence, however, of cell destruction and gliosis which apparently is stayed at the time of the treatment; so that while there is a damaged brain left, the functional activities are such that the individual may be returned, more or less impaired, to the community. The important point which should be made in the differential diagnosis of these conditions is that there is nothing specific in the character of the inflammatory reaction, and it is necessary to take for examination a number of sections from different portions of the central nervous system and to critically enumerate the findings in representative areas before reaching a diagnosis.

Botulism.—Two affections giving profound disturbances in the functional activity of the central nervous system are those due to the toxin produced by the Clostridium botulinum and that of tetanus. The spores of the first, contained in contaminated food products inadequately sterilized and grown in a somewhat neutral medium, produce an intensely potent toxin which, when consumed, is readily absorbed in the gastro-intestinal tract, leads to more or less gastro-intestinal disturbance, followed by lethargy, profound exhaustion, and, finally, death. The central nervous system shows a condition in which it was formerly considered that certain hyaline thrombi occurring in the vessels were responsible. This appearance of thrombi is by no means specific, but may occur in a number of weak cachectic conditions where death comes on very gradually. There is no inflammatory reaction present and the toxin is considered as affecting more particularly the neuromuscular apparatus of the body.

Tetanus.—The bacillus of tetanus, likewise, as is well known, produces toxin, particularly when introduced in puncture wounds. This toxin is gradually absorbed, probably not passed by way of the nerve fibers, as was formerly supposed; but upon reaching the central nervous system it produces symptoms of marked excitement and other well-known phenomena. Here again the toxin is without effect in producing inflammatory reaction and, although various alterations have been described in the nerve cells, practically nothing that can be considered specific has been discovered.

IN CONCLUSION

Rabies has caused eighty-six deaths in humans in California over a period of years. Only thirty of these received the preventive Pasteur treatment. Likewise, only fourteen had the wounds due to biting of an animal cauterized with fuming nitric acid, a protective procedure regarded as mandatory. Discussion is offered as to the differential microscopic anatomical diagnosis of rabies and other diseases. Finally, health officials must assume the responsibility for the control of rabies in a community, using every measure available, and ignoring the unseemly and sometimes fanatical clamor certain to arise when such control measures are applied to the dog, and perhaps other animals.

DISCUSSION

J. L. Pomeroy, M. D. (Los Angeles County Health Officer, Los Angeles).—The paper by Doctors Geiger and Rusk concerning rabies is most timely. Few persons indeed realize, as the authors state, that the control of rabies is not a minor public-health problem. On the contrary, it is really one of the most difficult problems in public health—not because of any inherent defect in the machinery of control, but largely because of the psychology of our people. In Southern California particularly, the dog lovers are literally blind to the facts concerning rabies. In fact, many of them can almost be termed "dog worshippers." Since, in more than any other disease, coöperation of the public is the essential keynote of success, the efforts of the health officer are constantly nullified by both open opposition as well as mere indifference. In spite of human sacrifice, and in spite of tremendous suffering among the dogs themselves, I regret to state that a considerable percentage of our population fight more vociferously and effectively for the dog and its assumed rights than they do for many of their own political rights. All of which creates a situation in which the health officer "takes it on the chin" persistently and constantly.

The present outbreak of rabies in Los Angeles County has cost the County Health Department, during the calendar year 1937, nearly $60,000 and two human deaths. Here 789 persons received the Pasteur treatment; 2,204 had their wounds cauterized with fuming nitric acid; and 9,990 dogs' heads were submitted to the laboratory for examination. During the calendar year of 1937 there were 773 positive cases of rabies among dogs, which was the highest of any year in the history of the Department.

Following the action of the State Department of Public Health in invoking the Rabies Prevention Act, we have recently been served with a restraining order, the effect of which is to paralyze the enforcement of the law. This restraining order was based on an act which is not in force in Los Angeles County and has, in my opinion, no relation whatever to the Rabies Prevention Act. At the present writing it has not yet been decided, but it is quite evident that we are fighting not only the disease "rabies," but an emotional condition in the minds of some of our citizens which has demoralized law enforcement. The same forces are behind the new proposed Humane Pound Law which, of course, is aimed at the scientific use of animals in medical research. It is necessary that the population really want public health and preventive medicine before any health officer can give to that public the benefits of scientific knowledge. It would appear most emphatically that a considerable percentage of the people want freedom of dogs and rabies rather than the freedom from rabies and restriction of dogs. Meanwhile what becomes of the desires of the people who are entitled to protection of their children and

themselves from this serious infectious disease? Only time will answer this question.

❦

W. M. Dickie, M. D. (Director of State Department of Public Health, San Francisco).—As Doctors Geiger and Rusk have stated in this paper, "rabies is a serious and expensive preventable disease." Since 1910, 15,226 cases of rabies in animals have been recorded with the State Department of Public Health, and approximately 95 per cent of these cases have been in dogs. The infection has been recorded also in cats, cows, coyotes, foxes, goats, hogs, horses, monkeys, mules, rabbits, raccoons, rats, sheep, skunks, and squirrels. During this same period rabies infection has been reported from fifty-three of the fifty-eight counties, and it is interesting to note that the following counties have reported cases for twenty or more years out of the twenty-eight years represented by our records:

Madera, Sacramento, Stanislaus	20 years
Alameda, Kern, Kings, San Joaquin	21 years
Riverside	22 years
Tulare	23 years
Los Angeles	24 years
San Bernardino	25 years
Fresno	26 years

We believe, therefore, that while the dog is the chief disseminator of the disease and the source of the majority of the cases in humans, the actual reservoir of infection is in the wild animals, such as coyotes and skunks in the foothill counties.

With reference to rabies in humans, Doctors Geiger and Rusk have presented the data recorded by our department prior to 1938. So far this year three human cases have occurred. Two of the patients were bitten by stray dogs, and the third was infected while treating a sick cow. This third patient put his hand down the cow's throat, attempting to grab the tongue, and the back of his hand was scratched by her teeth. The abrasions were not cauterized, but antirabic treatment was instituted within forty-eight hours. However, symptoms developed twelve days after exposure. This case was of the paralytic type, and the attending physicians were unable to differentiate between rabies and poliomyelitis until the report of rabies was received from the pathologist.

❦

Hyman I. Vener, M. D. (Los Angeles City Health Department, Los Angeles).—Rabies at the present time is the most serious problem confronting the Departments of Public Health in Los Angeles County. By its insidious spread, the disease has reached such alarming proportions that it was necessary for the California State Board of Health to declare a quarantine. Unfortunately, at the present writing (May 6, 1938), a temporary restraining order is in effect, thereby further complicating the picture.* Such an order permits licensed dogs to wander about the streets unrestrained. Since rabies is no respecter of a dog license, the situation in Los Angeles City and County has indeed become alarming. Doctor Geiger is to be congratulated on the lack of the disease in animals and man in San Francisco. I should like to inquire what measures were instituted?

I have witnessed four cases of human rabies during the past six months. To those who doubt such a clinical entity, I only wish they could see the pitiful sufferings of the victims and the helplessness of medical science. Nature, by its merciful messenger, Death, finally terminates the patient's agony. Once such a picture is witnessed the most cynical critic will pause to reflect the shortcomings of our efforts to deal with the problem of rabies.

Cases of human rabies unquestionably do occur without a definite history of a bite. This can often be explained by the victim having an abrasion which at the time may appear to be insignificant. Nevertheless, the victim has been in intimate contact with the rabid animal, and the virus in the saliva has been inoculated through the broken integument. It must be reiterated that cases of human rabies do occasionally occur, despite first-aid treatment with fuming nitric acid and the subsequent Pasteur treatment. We must be certain that the vaccine used is of sufficient potency to stimulate antibody formation, but an occasional individual will be found who is resistant to this type of stimulus.

Perhaps, following the experimental work of Webster of the Rockefeller Institute for Medical Research with mice, a new and improved vaccine may be prepared which may have many advantages over preparations now available. Possibly, too, in the future, rabies vaccine will be rated according to standards set up by the mouse inoculation tests.

The Pasteur Institute of Paris in 1918 reported the treatment of 1,803 cases, of which three died with rabies, a fatality rate of 0.16 per cent. From 1886-1918, a period of thirty-three years, the Institute treated 39,880 persons, with a total of 140 deaths, a fatality rate of 0.37 per cent.

In contrast, the generally accepted rate among exposed and untreated cases is 15 per cent. Postvaccinal paralysis following the administration of the Pasteur treatment is a minor factor. McKendrick, in the "League of Nations Quarterly," cited the record from the Pasteur Institute: paralysis developing in only nineteen instances in a treated group of 69,541 persons, a rate of 0.027 per cent.

The comparative microscopic pathology is most excellent. However, I feel that animal inoculation should be done as a confirmatory procedure in all cases of human rabies, and when the diagnosis in animals is in doubt. Webster reports the diagnosis by inoculating the suspected material into mice.

I believe that there are, undoubtedly, many abortive cases and apparent healthy carriers among dogs. Consequently, canine rabies is more widespread than we have thought heretofore. As a result, the most practical and simplest suggestion would be the elimination of the stray dog and the confining of the licensed animal. As long as this problem is made a political football, and pressure exerted on the various political factions, by minority groups, then the final word in the control of the disease will not have been said.

* Editor's Note.—The temporary restraining order issued by Superior Judge Emmet H. Wilson of Los Angeles was vacated subsequently. His opinion and decree were printed in the June issue of California and Western Medicine, on page 478.

THE TREATMENT OF SYPHILIS.*

FOREWORD.—The control of syphilis is intimately associated with the treatment of the disease. So effective are antisyphilitic drugs now available that infectiousness can be controlled within a few weeks after treatment is started. If it were possible to bring every infectious case of syphilis under treatment and continue such treatment along modern outlines of therapy, the problem of syphilis control would be practically solved.

From a public health standpoint there are two objectives in the treatment of syphilis. The first is to control the infectiousness of the patient and thereby prevent spread of the infection. The earlier in the course of the disease new cases can be found and brought under treatment the fewer will be the new infections.

The second objective in treatment is the prevention of the development of the late complications in the individual. The chief costs of syphilis arise as a result of the late manifestations of the disease. Most of the pain, suffering, and loss of life occur late in the disease. Any plan of therapy is inadequate if it does not aim at prevention of these late manifestations.

As a result of extensive studies in America and elsewhere, it is now possible to prescribe with some degree of definiteness the minimum requirements

* This is a reprint of Special Bulletin No. 62, issued by the California Department of Public Health. Reprint copies of this bulletin on "The Treatment of Syphilis" may be obtained by physicians upon request. Addresses of State Public Health Board offices appear in each issue, on advertising page 6.

for treatment. The procedure outlined in this bulletin is presented to the medical profession of California with the view that it may be used as a guide in treatment. Some physicians will prefer some modification of the outline, or may prefer other drugs, but it is urged that any modification adopted provide the equivalent of the treatment proposed. There is considerable evidence that mapharsen is equal to or perhaps preferable, in some cases, to neoarsphenamin. Some physicians now use mapharsen with success with patients not tolerating neoarsphenamin. Some prefer maphersen in all cases. It must be appreciated, also, that opinions vary somewhat as to bismuth preparations.

It is realized that there are now and will continue to be advances in therapy. However, it would seem preferable that the trial of new drugs and treatment procedures be restricted to large clinics where controlled series of cases can be studied. The physician and clinics handling few cases would preferably adhere to the tried and proved methods.

It may be recommended that physicians desiring to keep abreast of developments in the venereal-disease field subscribe to the United States Public Health publication entitled, "Venereal Disease Information," issued monthly at a subscription price of fifty cents per year. Address Superintendent of Documents, Washington, D. C.

More extensive discussions on treatment may be found in the following texts:

The Modern Treatment of Syphilis, by J. C. Moore. C. C. Thomas, Springfield, Illinois, 1933.

Modern Clinical Syphilology, by John H. Stokes. W. B. Saunders Company, Philadelphia, 1935.

EARLY SYPHILIS

Early syphilis is that period of acquired syphilis which extends from the time of the appearance of the primary sore through the healing of the secondary lesions. It is during this period that the Treponema pallida multiply sufficiently at the site of the inoculation to form the primary sore, and then disseminate throughout the body to give the symptoms of secondary syphilis. Clinically, we recognize the following stages of early syphilis:

(*a*) Primary stage, seronegative.

(*b*) Primary stage, seropositive.

(*c*) Secondary stage, *i. e.*, the eruptive period, indicating a widespread dissemination of the Treponema pallida.

The early period of syphilis is the golden opportunity of therapy, and offers the greatest chance of cure. From a public health standpoint, the control of early syphilis is most important, as it is in this period that the infection is easily transferred from one individual to another. As high as 86 per cent of patients properly treated in the seronegative primary stage should be cured; 70 per cent in the seropositive primary stage, and 65 per cent in the secondary stage may expect a cure. These percentages represent the statistics compiled by the Coöperative Clinics.[1] Moore[2] states that, with the best available treatment, the chance of cure in seronegative primary syphilis is approximately 100 per cent; in seropositive primary 95 per cent; and in early secondary syphilis 90 to 95 per cent. The term "cure" is used advisedly, and is defined as a complete eradication of all signs and symptoms of the disease with nontransmission of the infection over the period of a lifetime.

Treatment in the early period of syphilis must be continuous, and carried over a long period of time if best results are to be obtained. It is essential that the patient be impressed with this fact, as inadequate therapy may be harmful to the individual. Treatment in this period of syphilis lends itself to standardization, and the plan adopted should be rigidly followed as to dosage of drug and the time interval of the injections. By continuous therapy is meant the uninterrupted administration of remedies until the end of treatment.

Seronegative primary syphilis should be treated for at least one and one-half years; seropositive primary and secondary syphilis should be treated for two years or more.

SEROLOGIC CONTROL

The blood Wassermann and Kahn tests may be done at the conclusion of each course of bismuth salicylate, or they may be done at the conclusion of the required amount of treatment for the given patient. This latter method is called the bloc type of treatment, and has a tendency to encourage the patient to complete the course of therapy prescribed, and further make him less "Wassermann-conscious."

At the conclusion of treatment the blood Wassermann and Kahn tests should be done at the six-week intervals for two examinations. If found consistently negative, they should be done at three-month intervals for the first year, six-month intervals for the second year, and then one year later. The spinal fluid should be examined within three months after treatment is discontinued. If the patient is found to be physically free of any signs of syphilis, and serologically negative during this period of observation, he may be considered "cured."

In the event that the blood serologic tests remain positive after the required amount of therapy has been received, the patient should be treated for an additional year. Treatment may then be discontinued, and if the blood serology is still positive the patient placed under observation indefinitely. If the spinal fluid is positive after treatment has been concluded, special methods of therapy should be instituted.

Clinical relapse is usually the result of inadequate therapy in the early period of syphilis. It occurs in about 10 per cent of inadequately treated patients, while in the adequately treated group it is a rarity.

Neurorecurrence, or neurorelapse, requires special mention. This condition is an overwhelming invasion of the central nervous system by Treponema pallida, with the sudden development of an acute syphilitic meningitis, or the occurrence

1 Stokes, J. H., Cole, H. N., Moore, J. E., O'Leary, P. A., Wile, U. J., Clark, T., Parran, T., and Usilton, L. J.: (b) Section II. Results of Treatment in Early Syphilis, Ven. Dis. M. J., 13:207, 1932.

2 Moore, J. E.: The Modern Treatment of Syphilis. Charles C. Thomas, Baltimore, 1933.

of a cerebrovascular accident such as hemiplegia, a monoplegia or a paraplegia, or various cranial nerve palsies. For this condition, satisfactory results may be obtained by employing the following regimen. The patient should be rapidly mercurialized with a course of twenty intramuscular injections of mercury succinimid, grains one-quarter, each given three times weekly. This should be followed by a course of eight injections of neoarsphenamin, 0.45 gram to 0.6 gram. The spinal fluid should show at this time a marked reduction in the cell count and a general improvement in the other spinal-fluid findings. Treatment should then be continued as indicated in Table 1. Other forms of relapse may be treated as indicated.

Table 1.—*Plan of Treatment for Early Syphilis**

Day	Neoarsphenamin Intravenously	Bismuth Salicylate Intramuscularly	
1	0.45 gm.		
5	0.45 gm.		
10	0.45 gm.		
Week			
3	0.6 gm.		
4	0.6 gm.	0.2 gm.	
5-7	0.6 gm.	0.2 gm.	
8-11		0.2 gm.	
12-17	0.6 gm.		
18-19	0.6 gm.	0.2 gm.	
20-25		0.2 gm.	
26-33	0.6 gm.		
34-41		0.2 gm.	
42-47	0.6 gm.		
48-57		0.2 gm.	
58-63	0.6 gm.		
64-75		0.2 gm.	End of treatment of seronegative primary stage.
76-81	0.6 gm.		
82-93		0.2 gm.	
94-99	0.6 gm.		
100-104		0.2 gm.	End of treatment of seropositive and secondary stages.

* Unless otherwise indicated, injections of these drugs are given once each week.

LATENT SYPHILIS

This phase of syphilis is the period in which all signs and symptoms of the disease have disappeared, and is diagnosed by the presence of positive serum tests or by a very definite history of the infection with inadequate therapy. It may be further divided into early latency—that is, within four years of the onset of the infection; and late latency, more than four years after the initial infection.

The purpose of treatment in latent syphilis is to "cure" the patient or to prevent late complications of the disease. It is obviously poor judgment to treat a patient of advanced age because he has a positive blood Wassermann reaction if there are no clinical evidences of the disease. On the other hand, it is very much worth while to treat patients in the latent stage of syphilis who have a reasonable length of life before them.

Plan of Treatment for Latent Syphilis.—In latent syphilis, treatment should be continuous for a year and a half, provided the drugs are tolerated well. After this time rest periods of six weeks may be given. The total length of treatment should be two to three years. Three years should be considered the endpoint of treatment, whether the blood serologic tests are positive or negative. (See Table 2.) A patient with a positive spinal fluid is not in the stage of latency, and should be treated as outlined for syphilis of the central nervous system.

At the conclusion of treatment, patients in the late latent stage of syphilis should be kept under observation for the rest of their lives if possible. In the event that the blood Wassermann and Kahn reactions have reversed to negative as a result of treatment, the patient should be seen yearly to check on the serum and for physical examination. It is advisable to examine the spinal fluid in this group of patients every three to five years.

Patients in the early latent stage of syphilis should be observed for three years after conclusion of treatment, and if clinically free of signs of syphilis, and serologically negative, should be regarded as "cured."

LATE SYPHILIS

Late syphilis is that period of the disease which is characterized by the development of signs and symptoms due to the formation of gummas in the various tissues. Any organ or tissue of the body may be affected by this process. This stage of syphilis may appear within a few months of the initial lesion, or, as is the rule, several years later. It is impossible to outline a plan of treatment which would be applicable to the entire group of patients with late syphilis. In general, the plan outlined for latent syphilis would be suitable for patients who present only evidences of late syphilis of the skin and mucous membranes of the mouth, anus and genitalia, of the bony skeleton, the skeleton musculature and subcutaneous tissues. However, where the cardiovascular system, the nervous system, the abdominal viscera, and special organs (such as the eye) are involved, the plan of treatment must be changed to meet these situations.

NEUROSYPHILIS

Involvement of the central nervous system is probably the most frequent and most important complication of late syphilis. It is found in about 25 per cent of all patients in this stage of the disease. The introduction of tryparsamid in 1917 by Heidelberger, and fever therapy by von Juaregg in 1919, have been outstanding contributions to the treatment of all forms of resistant syphilis of the central nervous system. They are, however, of particular value in the treatment of the parenchymatous forms of neurosyphilis, such as paresis, taboparesis, and tabes dorsalis.

Classification of Neurosyphilis. — Late neurosyphilis may be classified as follows:

(*a*) Asymptomatic neurosyphilis; that form in which the only evidence of neurosyphilis is the presence of a positive spinal fluid. This may be compared with the latent type of systemic syphilis.

(*b*) Meningeal and meningovascular neurosyphilis.

(*c*) Parenchymatous neurosyphilis; that is, general paresis, taboparesis, and tabes dorsalis.

TABLE 2.—*Plan of Treatment for Latent Syphilis*

Week	Bismuth Salicylate Intramuscularly Weekly	Mercury Salicylate Intramuscularly Weekly	Neoarsphenamin Intravenously Weekly	Potassium Iodid (Saturated Solution) By Mouth
1-12	0.2 gm.			1 cc., t.i.d.p.c.
13			0.45 gm.	
14-18			0.6 gm.	
19-30	0.2 gm.			1 cc., t.i.d.p.c.
31-35			0.6 gm.	
36-47	0.2 gm.			
48-53			0.6 gm.	
54-65				
66-71			0.6 gm.	
72-77				
		REST		
78-83	Check blood and spinal fluid. If blood is positive and spinal fluid is negative, continue as follows:			
84-95		0.1 gm.		1 cc., t.i.d.p.c.
96-101			0.6 gm.	
		REST		
102-107	Check blood. If Wassermann or Kahn are positive, continue treatment.			
108-119	0.2 gm.			
120-125			0.6 gm.	
		REST		
126-131	Check blood. If Wassermann or Kahn are positive, continue treatment.			
132-143	0.2 gm.			
144-150			0.6 gm.	
151-162	0.2 gm.			

This marks the end of treatment for latent syphilis, whether the blood Wassermann or Kahn reactions are positive or negative. If the spinal fluid is positive, the case should be regarded as asymptomatic neurosyphilis.

As these various types of neurosyphilis do not lend themselves to one plan of treatment, an outline of therapy for asymptomatic neurosyphilis is presented. Special indications in the other forms of neurosyphilis will be pointed out later.

GENERAL PARESIS

In general paresis with clinical evidence of mental deterioration, tryparsamid therapy should be instituted at once. If the mental deterioration progresses unchecked by this treatment, or if deterioration is marked, pyrotherapy or artificial-fever therapy should be instituted simultaneously with tryparsamid therapy. The course of pyrotherapy may be repeated within six months or one year, if deemed necessary. Tryparsamid may be given in two- to three-gram dosage intravenously for a series of fifteen to twenty-five injections. This drug has earned well-deserved recognition as the most effective remedy in the treatment of neurosyphilis. It is tolerated very well by the patient. The most important toxic effect is upon the optic nerve. Blindness has been reported after its use. This should not deter one from employing this drug, as optic complications of a serious nature are very unusual and can be prevented in a large measure by careful examination of the fundi and visual fields before treatment is begun, and by checking the eye-grounds at frequent intervals. Subjective symptoms of visual disturbances precede objective changes, and by discontinuing the drug serious harm can be prevented. Visual disturbances following tryparsamid therapy usually occur within the first five to ten injections of the drug.

Tryparsamid courses should be alternated with courses of bismuth salicylate, as shown in Table 3.

PYROTHERAPY

The introduction of artificial fever for the treatment of general paresis and other forms of resistant neurosyphilis has changed the outlook for many of these patients from one of complete hopelessness to that in which an arrest of their disease may be expected.

Malaria therapy, as introduced by Wagner von Juaregg, has been dramatic in its effects upon general paresis. During recent years other methods of producing artificial fever have been introduced. As the therapeutic effects are comparable where

TABLE 3.—*Plan of Treatment for Asymptomatic Neurosyphilis*

Week	Tryparsamid Intravenously Weekly	Neoarsphenamin Intravenously Weekly	Bismuth Salicylate Intramuscularly Weekly	Potassium Iodid (Saturated Solution By Mouth
1-11			0.2 gm.	1 cc., t.i.d.p.c.
12		0.45 gm.		
13-18		0.6 gm.		
19-24			0.2 gm.	1 cc., t.i.d.p.c.
25	1.0 gm.			
26-49	2.0 gm.			
50-57			0.2 gm.	
	Check spinal fluid. If positive or negative, continue treatment.			
58-72	2.0 gm.			
73-80			0.2 gm.	
81-95	2.0 gm.			
96-103			0.2 gm.	
	Check spinal fluid. If negative and previous test was negative, discontinue treatment. If negative and previous test was positive, continue treatment.			
104-119	2.0 gm.			
120-127			0.2 gm.	
128-142	2.0 gm.			
143-150			0.2 gm.	

If spinal fluid remains consistently positive, ten pyrotherapy treatments, consisting of fifty hours of fever over 104 degrees Fahrenheit (40 degrees Centigrade), should be given simultaneously from week 104 to week 113. Many workers are recommending 2.0 and 3.0 gm. respectively instead of 1.0 and 2.0 gm.

temperatures of 104 to 106 degrees Fahrenheit are developed and maintained for several hours, it is generally agreed by most observers that the essential factor in this treatment is the elevation of body temperature rather than any specific effect of the method used.

TABOPARESIS AND TABES DORSALIS

Patients with taboparesis should be treated as those with general paresis.

In tabes dorsalis the plan outlined in Table 3 should be followed. It has been found that pyrotherapy is particularly effective in relieving the severe pains and crises of this type of syphilis, and may be employed where indicated.

LUMBAR PUNCTURE

Examination of the spinal fluid should be done in all patients who have, or have had, syphilis, no matter how early the case had been diagnosed nor how intensively it had been treated. Lumbar puncture may be done for diagnostic purposes or as a guide in therapy.

In early syphilis, lumbar puncture should be done at the conclusion of treatment, as involvement of the central nervous system is usually controlled by the treatment advised for this period.

In latent syphilis, lumbar puncture should be done during the first rest period.

In late syphilis, lumbar puncture should be done after one year of treatment if there are no clinical evidences of neurosyphilis. If such signs are apparent, lumbar puncture should be done before treatment is instituted, and repeated at intervals of six months to a year as a guide to therapy.

COMMENT

Due to lack of space, the toxic reactions which are met with as a result of antisyphilitic therapy with drugs have not been discussed. A plan of treatment for certain types of syphilis, such as cardiovascular syphilis, hepatic syphilis, syphilis in pregnancy, etc., has also been omitted. More extensive treatises on the subject will have to be consulted for discussion of these problems.

The success of a plan of treatment for a given case of syphilis will depend on the skillful use of the drugs advised, and rigid adherence to the plan adopted. Every precaution should be taken to make the treatment "smooth"—that is, without serious reactions. Irregular treatment, whether due to a lack of coöperation on the part of the patient or as a result of toxic reactions, is always unsatisfactory.

In early syphilis the intensive use of the arsphenamins is essential, as these drugs are highly treponemicidal. Bismuth and mercury, the resistance-building drugs, are less important, but nevertheless must be used in conjunction with the arsenicals. In this stage of the disease, particularly previous to the appearance of the secondary eruption, a cure is attempted before the patient has had an opportunity to develop his own resistance mechanism to its highest degree against the infection. Therefore, inadequate therapy leaves the patient helpless against invasion by the Treponema pallidum. Thus accounts for the frequency of

clinical relapse in those patients who have had only a few injections of neoarsphenamin and no other treatment.

In latent and late syphilis the resistance mechanism of the patient is developed to a high degree, and treatment is altered accordingly. Therapy is begun with a long course of bismuth, combined with potassium iodid by mouth. This accomplishes a gradual therapeutic effect without disturbing too abruptly the relationship between the host and the parasites. Here the arsphenamins are less important, and are given in short courses between those of the heavy metals.

Invasion of the various organs of the body occurs during the early period of syphilis when the Treponema pallidum is disseminated. Therefore, treatment should be as early as possible. The final therapeutic effect will depend upon the amount of destruction produced by the disease before therapy was instituted.

Every effort should be made to assure *continuous* treatment for the required time. In accepting a case of syphilis for treatment, a physician assumes an obligation not only to the patient but to the community as well. If inadequately treated, such a patient may become a menace to others as a result of infectious relapse, or, years later, may become a public charge as a result of crippling complications. Any outline of therapy must include a consideration of the problem of how the cost is to be met and continuous treatment assured. If the patient, because of economic difficulties, is unable to continue treatment under private care, provisions should be made for clinic attendance. On the other hand, any clinic patient who becomes able to pay for private care should be returned to his physician. A report, which should include a brief history, laboratory findings, and treatments, should be given the patient whenever transfers are made from physician to clinic, or *vice versa,* or from clinic to clinic.

SULFANILAMID: ITS USE IN UPPER GENITAL TRACT INFECTIONS IN THE FEMALE*

By R. E. Gillett, M. D.
San Francisco

Discussion *by H. N. Shaw, M. D., Los Angeles.*

INTRODUCTION.—Much information is accumulating in the medical literature concerning the treatment of streptococcic and Neisserian infections with sulfanilamid. In spite of the prominent rôle that this drug is now playing in the treatment of these infections, very little clinical work has been published indicating the therapeutic value of sulfanilamid in pelvic inflammatory disease. The scope of this paper is to present the results of such therapy in fifty cases of pelvic inflammatory disease treated on the Stanford Gynecological service, at the San Francisco Hospital, since July 1 of last year. Consideration is limited to inflammatory lesions of the upper portion of the female genital tract; primarily, salpingo-oöphoritis and parametritis. No attempt is made to determine the value of sulfanilamid in uncomplicated lower genital tract infections, as such cases are relatively scarce in the San Francisco Hospital. Only those patients having initial or recurrent acute salpingo-oöphoritis or parametritis are included in this series, because nonacute cases present no criteria suitable for therapeutic evaluation.

DOSAGE

Marshall and others have recently shown that sulfanilamid is absorbed almost completely from the gastro-intestinal tract within four hours, and that the concentration in the blood does not mount more quickly or obtain a higher level with subcutaneous than with oral administration. These investigators have shown that the concentration of sulfanilamid in the blood must attain a value approximating 10 milligrams per cent before any definite therapeutic benefit occurs. Moreover, these investigators recommend large initial doses, so that the blood concentration will reach the required level as quickly as possible.

In accordance with these principles, the scheme of dosage, as set forth by Long and Bliss, was adopted. Such a program provides four doses of sulfanilamid daily, totaling 80 grains a day for the first two days, 60 grains a day for the next three days, 40 grains a day for the following two days, and then 20 grains a day until discontinued. A few patients were given either 30 or 100 grains daily in an attempt to evaluate the effects of the drug in both small and large doses.

None of the patients constituting this series received other forms of therapy. Douches were prohibited. All patients were confined to bed, and were given fluids *ad lib* and regular diets as far as tolerated. Codein, aspirin, and sedatives were employed to relieve pain.

RESULTS

The patients in this series have been divided into three groups and the results with sulfanilamid in each group discussed separately. Such grouping differentiates those cases having initial acute salpingo-oöphoritis from those cases with recurrent acute salpingo-oöphoritis. Acute parametritis is considered as the third entity. The clinical therapeutic value of a new drug may be unconsciously colored by that variable factor, personal interpretation. We have sought to reduce this element of error by establishing the following criteria for a clinical comparison: (1) effect of sulfanilamid upon the size of adnexal inflammatory masses, (2) the length of treatment required before the patient becomes afebrile, (3) length of treatment required to render the patient free of pain, (4) the amount of therapy required before pelvic tenderness disappears, and (5) the effect upon cervical discharge.

Control cases were not done, because we felt that the results with other types of therapy had been already amply exploited; furthermore, we deemed the selection of exactly similar cases to be an impossi-

bility, and that comparison made from such a small series would undoubtedly lead to false conclusions.

INITIAL ACUTE SALPINGO-OÖPHORITIS

These cases numbered nineteen, in sixteen of which the patients had palpable adnexal masses. The three cases without adnexal masses all represented very early stages in the attack. Two of these three had cervical smears positive for gonococci. All three patients, when given sulfanilamid according to the 80–80–60 plan, were completely symptom free and afebrile within four days. Pelvic examination at that time showed very little, if any adnexal tenderness, although originally the adnexal regions had been extremely tender. Negative smears were obtained in one case after the administration of 230 grains, and in the other case after 350 grains of sulfanilamid. With only one week in the hospital, representing 420 grains of the drug, these patients were sent home to follow their customary daily routine work. All three were still symptom free and afebrile when reëxamined in the follow-up clinic one month later. At that time one of the patients had very slight adnexal tenderness without any definite induration or thickening. The other two patients had entirely normal pelvic organs, as far as palpation was concerned. Each of the three had slight mucoid cervical discharges containing a few pus cells, but still free of gonococci.

Of the sixteen patients with palpable adnexal masses, five showed improvement, six no change, and five actual enlargement of the inflammatory masses while receiving sulfanilamid. All but four of these patients were afebrile and symptom free within seven days, although adnexal tenderness persisted several weeks or more. Two of the patients that did not respond well to treatment had very large tubo-ovarian inflammatory masses extending well above the level of the symphysis. Incidentally, these two patients received 30 grains of sulfanilamid daily, whereas the other cases received 80–80–60 dosages. The other two patients failing to respond to therapy presented small adnexal masses, which became progressively larger while receiving the drug. Very little improvement occurred in either the amount or the nature of the cervical discharges. Only two patients in the group had positive gonococcal smears, and in both cases these became negative after 420 grains of sulfanilamid.

RECURRENT ACUTE SALPINGO-OÖPHORITIS

Some twenty-five out of the fifty patients in this series had recurrent acute salpingo-oöphoritis. Five of these had but a slight adnexal thickening, eight had large masses, and twelve had small adnexal masses.

All but one of the five with slight adnexal thickening showed definite improvement under sulfanilamid therapy. These patients became afebrile in five days and sympton free within ten days. Adnexal tenderness disappeared within two weeks, but in the majority of cases induration and thickening persisted in the adnexa for at least three weeks or more. Only one patient had positive cervical smears, and these became negative after 460 grains of sulfanilamid. The one patient showing no clinical improvement can be discarded, as this patient was able to tolerate but very small quantities of the drug.

The second group of eight patients having large inflammatory masses showed but little improvement after sulfanilamid therapy. The masses in one patient showed a decrease in size, in two patients no change, and in five patients an actual increase in size. All the patients in this group were afebrile in ten days, and symptom free in fourteen days. In spite of the initial improvement, in every one of these patients there were subsequently developed occasional mild bouts of lower abdominal pain, accompanied by low-grade fever. Adnexal tenderness was quite variable, but persisted to some degree in practically all of the patients for at least three weeks. Every one of the patients came to operation; consequently, any additional follow-up work was impossible. Laparotomy was performed partly because of failure to respond to conservative measures prior to the present acute episode and partly because of economic reasons. All but two of the patients in this group received from 500 to 800 grains of sulfanilamid, according to the 80–80–60 scheme. The two patients mentioned received 100 grains a day, until over 1,200 grains had been consumed. In spite of this large dosage, both of these patients had enlarged inflammatory masses on completion of therapy.

Twelve patients of recurrent acute salpingo-oöphoritis had small adnexal masses. Under sulfanilamid therapy, these masses decreased in size in five patients, and remained unchanged in the other seven patients. All of these patients were afebrile in eight days, representing from 300 to 440 grains of the drug. Pain disappeared within twelve days in all but one patient. Four of these patients had recurrent mild bouts of lower abdominal pain and fever, following the initial improvement. Adnexal tenderness was but slight after two weeks therapy in seven of the patients. The other five had considerable tenderness for at least one month. The total individual dosage in this group varied from 440 to 700 grains. Two of the patients with improved masses, and four of the patients with unimproved masses, received the drug in 30 grain daily amounts. The 80–80–60 dosage was used in the rest of the group. No definite change was noted in the cervical discharges. None of the patients had positive smears.

CERVICITIS

In contrast to the excellent results obtained with sulfanilamid in the treatment of acute Neisserian cervicitis, we have been unable to duplicate such results with this drug in the treatment of chronic cervicitis. Sulfanilamid therapy in chronic cervicitis has not only failed to reduce the amount of discharge, but it also has failed to render these discharges less purulent. In our series of cases, we did not find a single patient with chronic cervicitis who had positive gonococcal smears. Microscopic studies of the cervix before and after treatment have not shown any obvious histo-pathological improvement in practically all of the cases of chronic cervicitis, and in the majority of the cases with acute cervicitis.

ACUTE PARAMETRITIS

Six patients of acute parametritis were treated with sulfanilamid, according to the 80–80–60 plan. Five of these patients became afebrile and symptom free within one week. At this time the previously tender and markedly indurated broad ligaments had become soft and pliable. Tenderness was almost entirely absent. These patients left the hospital in twelve days. No restrictions were placed upon their activities while at home. Reëxamination in the follow-up clinic at one, and at two months failed to show any palpable pelvic pathology. The one patient that failed to respond to therapy had persistent lower abdominal pain and fever, which lasted for six weeks, in spite of large dosages of sulfanilamid totaling over 1,600 grains.

COMPLICATIONS

Anemia occurred in 50 per cent of the patients in this series. The average drop in hemoglobin was 19 per cent Sahli, and the average drop in red blood cells was 1,000,000.

Leucopenia developed in only one patient. The initial white count of 12,000 dropped to 3,400 after 485 grains of sulfanilamid, given according to the 80–80–60 scheme. Toxic symptoms were absent.

Nausea occurred in 40 per cent and vomiting in 20 per cent of the patients. The average quantity of drug producing nausea was found to be in the neighborhood of 340 grains. Administration of sodium bicarbonate with the sulfanilamid tablets helped to reduce nausea in a few cases.

Cyanosis occurred in 35 per cent. If this complication developed it usually appeared early in the course of therapy. The average total dosage causing cyanosis was found to be approximately 200 grains.

Cerebral symptoms, including headache, dizziness, disorientation, etc., were noted in 32 per cent of the patients.

Sulfanilamid in total dosages varying from 60 to 420 grains caused chills and fever in about 1 per cent of patients. Some of these temperatures reached 104 degrees. If a patient once developed chills and fever from the drug, small doses would invariably cause reappearance of the symptoms, even when given some five or six days after the sulfanilamid had been discontinued.

One patient developed dermatitis. The skin lesion was a fine macular rash which was generalized and not limited to the exposed portions of the body. This rash disappeared thirty-six hours after sulfanilamid therapy was discontinued.

CONCLUSIONS

The foregoing data suggest that sulfanilamid therapy in acute salpingo-oöphoritis is more effective during the initial attack than at any other time in the course of the disease. In our series a single week of sulfanilamid treatment produced apparent cures in 100 per cent of the initial patients not having demonstrable inflammatory masses.

Likewise, sulfanilamid appears to have definite therapeutic value in most cases of recurrent acute salpingo-oöphoritis unaccompanied by inflammatory masses. Our results show that 100 per cent of such patients were rendered afebrile and symptom free after ten days therapy; however, adnexal thickening and tenderness persisted for at least three weeks.

The beneficial effects from sulfanilamid therapy, in either initial or recurrent acute salpingo-oöphoritis, were found to be much less striking in those patients having palpable inflammatory masses. Conversely, sulfanilamid was found to produce but little if any improvement in adnexal masses.

Acute gonococcal cervicitis seems to respond excellently to sulfanilamid, but such therapy apparently has little value in chronic cervicitis.

Five out of six cases of acute parametritis were afebrile, and without palpable pathology after the completion of but one week of sulfanilamid therapy. Such evidence speaks for the value of sulfanilamid in the treatment of acute parametritis.

2635 Twenty-third Street.

DISCUSSION

H. N. Shaw, M.D. (901 Pacific Mutual Building, Los Angeles).—Our experience with sulfanilamid has been very similar to that of the author's.

It has given almost miraculous results in cases of acute gonorrheal salpingo-oöphoritis. A case with high fever and frightful pain which, under former methods, would require four to six weeks of bed rest before almost inevitable surgery, is now free from fever and discomfort within two or three days. The majority of these cases escape surgery. In exacerbations of old infections it renders them safe for surgery far sooner than any other method.

Recently, we removed the uterus and both tubes in a case where we expected to find tuberculous salpingitis. Smears made in surgery, and the microscopic sections, showed streptococcus. The patient developed a typical cellulitis in the broad ligaments, but this became soft and pliable in three or four days under sulfanilamid.

It is not a drug to be used without careful supervision. Reports from various clinics of deaths following relatively small doses indicate that some patients have a dangerous idiosyncrasy to sulfanilamid. Under a careful regimen, it has proved an invaluable method in the treatment of pelvic infections.

SULFANILAMID: ITS USE IN THE TREATMENT OF GONORRHEA OF THE LOWER GENITAL TRACT OF THE FEMALE*

By Arnold Manor, M. D.
San Francisco

Discussion *by Norman H. Williams, M. D., Los Angeles.*

ALTHOUGH for several years European medical journals have called attention to the beneficial effect of sulfanilamid on clinical and experimentally produced infections by the beta hemolytic streptococcus, the drug was not introduced into this country until the latter part of 1936. Since then, however, its use in combating various infectious diseases has rapidly increased, as evidenced by the numerous reports appearing in our medical literature during the past year.

Long and Bliss[1] were the first in this country (January, 1937), to confirm the experimental results of European investigators, who found that

* From the Department of Obstetrics and Gynecology, Stanford University School of Medicine.

Read before the Obstetrics and Gynecology Section of the California Medical Association at the sixty-seventh annual session, Pasadena, May 9–12, 1938.

sulfanilamid produced a very favorable reaction in mice infected with many times the lethal dose of beta hemolytic streptococci.

In 1936, Buttle and his coworkers[2] reported that sulfanilamid had a marked protective action against meningococcic infection in mice, and the following year Proom [3] confirmed their results. Schwentker[4] applied this observation clinically, and reported favorably on the effect of this drug in the treatment of meningococcic meningitis. As a result of this work, and because of the close biologic relationship between the meningococcus and the gonococcus, Long suggested the possibility of its therapeutic application in the treatment of gonorrhea. Dees and Colston,[5] acting upon this suggestion, made a preliminary report in May, 1937, on the use of sulfanilamid in the treatment of this infection in the male. The high percentage of successful results reported by them led us to employ it in the treatment of gonorrhea in the female.

STUDIES BY THE AUTHOR

In the study undertaken by us, we are primarily concerned with the effect of sulfanilamid on gonorrhea involving the cervix, Skene's or Bartholin's glands, and only patients in whom the gonococcus could be positively identified are included. In order to evaluate our results properly, no treatment other than the sulfanilamid was used, except where a particularly profuse and annoying discharge necessitated a cleansing douche. Most of the patients were cared for in our out-patient clinic, although a few were hospitalized because of associated severe pelvic inflammatory disease. At the beginning of treatment a blood Wassermann determination and complete blood count were done on each patient, and the red cell count and hemoglobin determination were checked weekly during the course of therapy. During the period of observation, which was four weeks or longer, alcohol and sex activity were forbidden, but no other restrictions were imposed. Patients reported at the clinic twice weekly for smears, and at each visit symptoms attributable to the drug were carefully recorded.

DOSAGE PROCEDURE

A dosage system similar to that suggested by Colston and Dees was employed by us, as follows: 1.2 grams four times daily for two days, 0.9 gram four times daily for three days, then 0.3 gram four times daily until a total of 30 grams had been given. The time required for this dosage is thirteen days. Later, a group of patients were treated with smaller amounts, using 0.6 gram three times daily until a total of 15 to 30 grams had been given. The time required for the maximum dose at this rate is seventeen days.

CLINICAL MATERIAL FOR THE STUDY

The total number of patients included in our study was thirty-three. Of this number, twenty-three, or 70 per cent, were cured; seven, or 21 per cent, had a relapse; and three, or 9 per cent, failed to respond to treatment. Of the seven whom we thought cured, but who returned with a recurrence or reinfection, five were cured following a subsequent course of treatment, and have remained so, and two were lost track of.

Twelve of the thirty-three patients received small daily doses. In this group, eight, or 67 per cent, were cured; one, or 8 per cent, had a relapse; and three, or 25 per cent, failed to show any improvement.

In the cases considered cured, the smears became negative in from three to ten days after the beginning of treatment, the usual time being three to four days. The one patient who was apparently cured, but who suffered a relapse, was later given larger doses, following which her smears became negative, and have remained so for more than four weeks. One of the three who did not respond to the small doses was cured by the large doses, while the other two failed to be influenced by either.

Twenty-five patients were treated with large daily doses, and of these, sixteen, or 64 per cent. were cured; six, or 24 per cent, had a relapse; and three, or 12 per cent, failed to show any response. The smears of those cured in this group became negative in two to ten days (most often in three to five days), and remained so. In most instances the discharge changed in character and amount from profuse and purulent to scant and mucoid. Relapse occurred in the six patients in from four to eight weeks following the beginning of treatment. Four of these (16 per cent), were cured by a subsequent course of treatment and have remained so, and the other two were not followed. Two of the three patients who showed no response in this group were also not influenced by the smaller dosage.

Evidence of intrapelvic inflammatory disease was noted in twelve (36 per cent), patients. Some improvement, which varied markedly in degree, was observed in the majority of these women. The impression obtained was that the improvement was more marked in patients in whom the inflammatory condition was acute or quite recent than in those in whom it was chronic. In none of the patients did a pelvic inflammatory process develop after the beginning of treatment. The administration of sulfanilamid seemed definitely to check the progress of this disease.

REPORT OF CASES

The patients failing to respond to sulfanilamid treatment presented clinical courses as follows:

Case 1.—A 20-year-old unmarried white woman suffering from gonorrheal cervicitis and subacute pelvic inflammatory disease was given a total of 75 grams over a period of eight weeks. Only an occasional negative smear was obtained, and she did not remain free from demonstrable gonococcus infection longer than two weeks at a time. The drug was well tolerated and there were no significant changes in the blood picture except that the white count, which was elevated at the beginning of treatment because of the inflammatory process, returned to normal when this condition subsided.

Case 2.—A 23-year-old married American Indian with acute gonorrheal cervicitis, skenitis, and bartholinitis, complicated by lues and a two months' pregnancy, was given a course of small doses of sulfanilamid aggregating fifteen grams. The smears remained positive throughout treatment, though the discharge improved. A course of large doses was begun, but the drug was poorly tolerated and the patient discontinued the treatment. Her smears are still

positive, and she is now being treated with local applications and douches.

* * *

CASE 3.—A 22-year-old unmarried white woman with acute gonorrheal skenitis and cervicitis, and a mild pelvic inflammatory process was treated with small doses of sulfanilamid, after which much improvement in symptoms was noted. The smears, however, remained positive. She was then given two courses of the large doses, which were very well tolerated. After the first course the smears were negative for about two weeks, but they again became positive and have remained so in spite of the second course of large doses. The patient is now being treated with local applications and douches.

* * *

CASE 4.—A 23-year-old unmarried white woman with acute gonorrheal cervicitis and skenitis was given small doses of sulfanilamid. Her smears became negative for a short time after treatment, but did not remain so. Following a subsequent course of large doses the smears again became negative and have remained negative for more than four weeks.

COMMENT

No serious reactions were noted in any of the patients. Those receiving the large doses frequently complained of malaise, dizziness, headache, nausea, and occasional vomiting. Initial cyanosis was common, but disappeared quickly when the dose was reduced. Skin rashes did not occur in any instance. The blood picture of the patients treated with small doses showed no appreciable changes, but a definite lowering of 10 per cent or more in hemoglobin content was noted in five patients (20 per cent), who were given the large doses. The greatest drop in hemoglobin was 25 per cent, which occurred fourteen days after treatment was begun.

A comparison of end results in the two groups using different dosages shows no material difference, which suggests that the large doses are not essential in all cases. Of the three failures in the small dosage group, only one was cured by a subsequent course of large doses.

The relatively high incidence of relapses brings up the question of the length of the treatment period. Dees and Colston[6], in their report of December, 1937, suggested a considerable extension of time in order to prevent relapses. Their hypothesis is that all the organisms are not killed in the initial days of treatment, and that after medication is discontinued, the remaining gonococci gradually increase in number until they can again be demonstrated clinically. This suggestion is in keeping with the findings of Long and Bliss in their experiments on mice infected with streptococci.

IN CONCLUSION

Our observations on the use of sulfanilamid in the treatment of gonorrhea in women confirm previous reports of its use in men. The prompt response to the drug, the facts that complications have not occurred and the infection has not progressed, and the apparent low toxicity of sulfanilamid lead us to conclude that this drug is of great value in the treatment of this type of infection.

DISCUSSION

NORMAN H. WILLIAMS, M.D. (1052 West Sixth Street, Los Angeles).—Sulfanilamid is a two-edged sword—on the one hand there are undesirable reactions, on the other a potency against certain types of infection. As yet the method of its action is uncertain—whether its action incites increased resistance on the part of the body as, for instance, phagocytosis, whether it acts as a germicide, or whether a bacteriostatic agent, seems as yet undetermined. Whatever may be the action, however, the gonococcus is one of the organisms that is affected. This paper by Doctor Manor, as well as the work of others, has definitely shown improvement or cure in the majority of cases suffering from acute gonorrhea. The chronic cases are often improved clinically, but the pathology may remain. This may be no indication that the organisms do not disappear, often chronic adnexal pathology is sterile. The fire of a burning house may be extinguished, but the damage done remains. So few cases of gonorrheal joints and endocarditis treated with sulfanilamid have been reported, it still remains to be discovered to what extent the treatment may influence these conditions.

In more recent years reports have been issued concerning the use of the compliment-fixation test in gonorrheal infection. As the antigen has become more stabilized, the test seems to assume more diagnostic accuracy. Would it not be interesting to continue this excellent type of investigation by treating a series of known positive fixation cases, both acute and chronic, with sulfanilamid, studying particularly the effect of the latter, not only from the clinical standpoint, but especially changes, if any, to the degree of fixation.

THE LURE OF MEDICAL HISTORY†

ROCKEFELLER, OSLER AND WELCH

By EDGAR LORRINGTON GILCREEST, M.D.
San Francisco

IN the death of John D. Rockefeller medicine lost the greatest lay benefactor it has ever had or probably ever will have. During his lifetime he both made and gave away more than any man who ever lived—over half a billion dollars. Up to 1934 the official figures reached the colossal sum of $530,853,632. He early learned that his philanthropies should be made through great channels, each set up to play a definite part in contributing to a planned investigation for an improved civilization. I have computed, from his various donations, that medicine was the recipient, directly or indirectly, of about $450,000,000. Because of these contributions, James Harvey Robinson placed

†A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of CALIFORNIA AND WESTERN MEDICINE. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

Mr. Rockefeller, many years ago, among the seven greatest Americans on the ground that, through his huge donations to medical science, he had accomplished more for the human race than any man on this continent.

Well may we ask who it was who early interested Rockefeller in medicine, and thus stimulated him in making donations to medical science? A great part of the credit and glory for this achievement belongs to Sir William Osler and to Dr. William H. Welch. Through them education "turned the eye of the soul toward the light."

SIR WILLIAM OSLER AND THE ROCKEFELLER GIFTS

The following account concerning Rockefeller's early gift to medicine, as told to me by Sir William himself in 1915, when I was associated with him in England during the early part of the Great War, will prove of great interest at this time.

One day at luncheon someone mentioned what the Rockefeller relief fund for the Belgians had accomplished. Doctor Osler remarked that: "The way in which Mr. Rockefeller first became interested in the Johns Hopkins Hospital was unusual. At dinner one evening in Baltimore, Mr. Gilman, former president of the University of California and at that time president of the Johns Hopkins University, and Mr. Gates, Mr. Rockefeller's right-hand man, were sitting side by side, and Mr. Gates remarked that not long ago he picked up, by chance, a book on medicine by a man named Osler, and looking through it he became so interested in it that he purchased a copy and enjoyed intensely reading the section on infectious diseases. Not long afterward he told Mr. Rockefeller how engrossed he had become in this book and that he wished to present him with a copy, which he did. A few days later, Mr. Rockefeller told Mr. Gates that he was surprised to know that medicine was such a wonderfully progressive science, and to learn what remarkable work that man Osler was doing in Baltimore. Mr. Gilman was naturally interested in Mr. Gates's story, and when he had finished he said: 'Now, Mr. Gates, if you would sit down tomorrow and write to Doctor Osler just what you have told me, I am sure he would feel very gratified.' Accordingly, in a few days I received such a letter from Mr. Gates. I handed it to Mrs. Osler, saying: 'Please put this letter in the safe. There may come a time when it will prove of service.'

"A few years later, that is, February, 1904, when the Baltimore fire destroyed many of the resources of the Johns Hopkins Medical School, I asked Mrs. Osler to look up the letter from Mr. Rockefeller's associate. It was readily found and I wrote immediately to Mr. Gates: 'You are doubtless aware of the awful fire which has visited Baltimore and of the great loss which Hopkins has sustained. Several years ago you wrote me a very interesting and kind letter, and it has occurred to me that probably you could interest Mr. Rockefeller in considering the unfortunate position in which this renowned medical school finds itself at this time.' A few days later I received a telegram, saying: 'Our Mr. Murphy will be with you tomorrow'; and "tomorrow" "our Mr. Murphy" came and spent several days in making an accurate estimate of the Hopkins loss. After Mr. Murphy's departure, several weeks passed, which seemed like months. As we heard nothing, our hopes had waned, when I received a letter from John D., Jr., saying: 'My father has carefully considered your losses, which total $450,000, and he wishes to know whether you would prefer to have a check or securities for the amount of $500,000.' I immediately took my letter of good news around to the treasurer, and Mr. Rockefeller was informed that we should be pleased to receive a check for the $500,000." Little did Osler realize at that time that Rockefeller's contributions to that institution would reach, in the end, $2,200,000.

INFLUENCE OF WILLIAM H. WELCH

What Doctor Osler began his venerable colleague and distinguished associate at Johns Hopkins, Doctor Welch, who was continuously president of the board of directors of the Rockefeller Institute for Medical Research from 1901-1933, carried on to a triumphant culmination in the organization of four great foundations. When he visited San Francisco seven years ago, a few weeks after scientists all over the world celebrated his eightieth birthday, I had an opportunity to discuss these foundations with him.

ROCKEFELLER INSTITUTE FOR MEDICAL RESEARCH

In 1904 the cornerstone for the Rockefeller Institute for Medical Research was laid to which Rockefeller contributed $59,931,891.62. The Institute's achievements include the discovery of serum treatment of spinal meningitis and of pneumonia, cause and manner of infection in infantile paralysis, nature of the virus causing epidemics of influenza, surgery of the blood vessels, discovery of tryparsamid or treatment of African sleeping sickness and general paresis, identification of the virus of yellow fever, development of yellow fever serum and a method of vaccination which virtually has stamped out the scourge and made possible the building of the Panama Canal, and the Carrel-Dakin method of treating wounds, which saved countless lives in the World War.

Soon afterward he contributed the additional great sum of $129,209,167.10 to the General Education Board which was organized for the "promotion of education within the United States without distinction of race, sex, or creed."

ROCKEFELLER FOUNDATION

In 1913 he established the Rockefeller Foundation "to promote the well-being of mankind throughout the world" and to which he gave a still greater sum, $182,851,480.90.

LAURA SPELMAN ROCKEFELLER FOUNDATION

In 1918, in memory of his wife, he founded the Laura Spelman Rockefeller Foundation, which concerned itself with public administration and to which he gave $73,985,313.77. It supported the International Health Board, concerned with the control of hookworm disease in fourteen southern

states in this country and in twenty-two foreign countries; of yellow fever in five South and Central American countries, and of malaria in ten southern states in this country.

One need read only "An American Doctor's Odyssey,' by Dr. Victor Heiser, to be fascinated by the romance and thrill of scientific achievement on a world-wide front, possible only under this Foundation. Partly as a war measure, the Foundation did much to control the spread of tuberculosis in France by campaigns of public education in hygiene and the training of women as health visitors.

ROCKEFELLER CONTRIBUTION TO CALIFORNIA

San Franciscans should ever remember that he did not forget them in their time of need, and donated $100,000 to the San Francisco Earthquake Sufferers' Fund in April, 1906. The University of California has been the recipient also of thousands of dollars of donations from Rockefeller which went to the Institute of Social Sciences, Institute of Child Welfare, and the Institute of Experimental Biology.

FAR-REACHING RESULTS OF ROCKEFELLER'S DONATIONS

One can perceive at a glance that, because of Rockefeller, millions of people all over the world are living who would be dead; millions of others are free of pain and enjoying a state of well-being and happiness because of his far-sightedness, wisdom, and generosity. He gave as no man ever gave before. His theory was to give in such a manner as not to make paupers of those who receive. Before him people groped their way without guide or chart in the ever-widening field of philanthropic endeavor. He, the Original Father of Big Business, organized and planned his donations upon as distinct lines of progress as his other business affairs. His goal was to make wealth of greater use to the present and future generations. His idea was that only by educating people to help themselves, do we strike at the root of many of the evils of the world. Just as he was reputed to have the "finest organizing mind since Napoleon," he was the world's greatest philanthropist and organizer in the science of giving, the greatest creator of charitable and scientific foundations that have contributed immeasurably to human welfare all over the globe. Indeed, if one reflects if his millions had been dissipated, as often occurs, and had not been turned into these great channels for the relief of human suffering all over the world, inestimable would have been the loss to mankind. Thus we see, through their devotion and service to humanity, why and to what extent the world honors and is everlastingly indebted to these three great men—Rockefeller, Osler, and Welch.

With the rapidly changing economic conditions and the drastic laws which are being enacted, it requires no unusual sense of prophecy to see that we are now in a new era. The Government is drawing on these great reservoirs of wealth as never before, to which science, education, and charity have looked for aid. The colossal Rockefeller charities doubtless will never be repeated. Can wealth be concentrated in private hands to society's advantage? This is one of the basic questions which confronts mankind today. In Rockefeller's case the answer is undeniably and emphatically in the affirmative. It is a direct challenge to the clamorous claims of Communism today.

CLINICAL NOTES AND CASE REPORTS

ARTIFICIAL INSEMINATION

By Albert T. Goldberg, M.D.
AND
Milton M. Schatz, M.D.
Fresno

Historical Résumé.—For centuries the idea of artificially impregnating animals has been entertained; the Arabians in the fourteenth century, so it was reported, having successfully carried out this procedure in mares. In 1700 the eggs of fishes were artificially fertilized, and in 1780 Spallanzani succeeded in artificially impregnating bitches. In the present day the science of breeding domestic animals and pisciculture by artificial fertilization has a definite place.

John Hunter, in 1776, successfully produced conception in the wife of a man with hypospadias by injecting the husband's semen into the vaginal vault. In 1866, J. Marion Sims reported favorable results from direct intra-uterine insemination.[1]

STERILITY

Sterility, in many instances, is due, not to definite pathological changes in the genital tract of either husband or wife, but rather to the fact that the spermatozoa may not be deposited directly into the cervical canal. Meeker[2] is in entire agreement with the conclusions of Huhner on this point. It is well known that frequently in the ordinarily acid vagina the life of the spermatozoa is very brief. Post-coital examinations show diminished mobility and many dead forms within a few minutes after ejaculation.[2]

Approximately one in every ten marriages is childless. Modern medicine should decrease this percentage; and every known method at our disposal should be employed in cases of couples who wish and are anxious to have children.

TECHNIQUE

A simple procedure, designed to overcome sterility, is that described by Mason[1] and Cohen,[3] which consists of introducing two cubic centimeters of semen into the uterine cavity very slowly, via a uterine cannula placed securely in the cervical canal. The injection should be performed very slowly in order to prevent expulsion of the semen

2 Meaker, Samuel R.: The Place of Artificial Insemination in the Treatment of Sterility, Boston M. & S. J., 191:495-497 (September 11), 1924.

3 Cohen, Joseph: Artificial Insemination: Report of Cases, New Orleans M. & S. J., 85:817-819 (May), 1933.

by uterine contractions; the object being to deposit the semen within the uterine cavity, and not to force the material into the tubes. There are four methods of procuring semen: masturbation; coitus interruptus, using a small jar; natural coitus, followed by aspiration from the vagina, and coitus condomatus.[4]

The following is a report of an interesting case in which we were successful in producing conception by artificial means. In this particular instance the principal reason for the attempt at artificial insemination was the extreme desirability of the couple to have children, and the growing dissension between husband and wife because of this barrenness.

REPORT OF CASE

Husband: Age, 33 years. History negative for gonorrhea, syphilis, and mumps. Has brothers and sisters who have children. Physical examination negative in all essentials. Blood Wassermann negative. Routine urinalysis negative. Smear made after prostatic massage shows no pus cells or any other abnormal findings. Condom specimen, examined within twenty minutes after intercourse, shows large number of spermatozoa, very actively motile, normal in appearance, with approximately 10 per cent nonmotile forms. No pus or bacteria found in this specimen.

Wife: Age, 22 years. Married two years and six months. History negative for gonorrhea and syphilis. Has brothers and sisters who have children. States that since she has been married both she and her husband have been very desirous of having children. No contraceptive measures of any kind used. Menstrual history: onset age 12 years, regular, interval twenty-eight days, duration four to five days, no dysmenorrhea. Has never been pregnant. No history of surgery, pelvic or otherwise. Last menstrual period April 16, 1937. Patient had a B. M. R. test made four months previously because of overweight, with reading of minus 24. Has been taking thyroid, one grain, three times a day. Repeated basal metabolic rate taken three months later showed a reading of minus 6.

Physical examination revealed a moderately obese young, white female 5 feet 6 inches tall and weighing 182½ pounds. Physical examination otherwise of no significance, with the exception of the pelvic examination findings of a second degree retroverted uterus. Vaginal media normally acid (Litmus). Cervical smear negative for bacteria and pus. Blood Wassermann negative. Routine urinalysis negative. Attempts to mechanically correct this malposition were fruitless.

The problem of artificial insemination was discussed, and both husband and wife desired that this procedure be carried out.

The husband was instructed to thoroughly wash his penis with soap and water, and, after the performance of coitus condomatus, to place the condom in an envelope and keep same at body temperature by placing it in his axilla. Examination of the specimen within twenty minutes after intercourse showed it to be normal, as described above.

The patient was placed in the lithotomy position, a bivalve speculum inserted and the area about the cervix cleansed, but not with antiseptic solution, so that no spermatozoa would be devitalized by the latter. Two cubic centimeters of semen were drawn up into a warm sterile syringe and through a sterile uterine cannula was injected very slowly, and with the least amount of pressure, into the cervical canal. The cannula was gently withdrawn and the patient allowed to rest for half an hour. This procedure was carried out on April 26, 1937, ten days after the last menstrual period, and was repeated three days later.

Course.—The following menstrual period, due May 23, 1937, failed to occur, as did the succeeding one. No Ascheim-Zondek test was done; but at the end of a two months' period, on June 6, 1937, definite signs and symptoms of pregnancy were observed. Pelvic measurements were adequate and the patient was given prenatal care, having her blood pressure, weight, and urine examined weekly. The patient gained twenty pounds during her pregnancy, her diet having been closely watched. The prenatal course was uneventful.

On January 24, 1938, she went into spontaneous labor. Diagnosis of R. O. A. was made with F. H. T. of 154, clearly audible in the R. L. Q. After six hours of labor, the cervix had about one centimeter of dilatation, when patient had a sudden hemorrhage of about 200 cubic centimeters of blood, which continued as a slow hemorrhage for about half an hour, during which time the fetal heart tones increased in rapidity and were hardly audible and, therefore, difficult to count. The patient showed very little sign of shock. Diagnosis of partial premature separation of placenta was made, and we performed an immediate, low-cervical cesarean section, and a living male infant weighing 7 pounds 14 ounces was delivered. The patient made an uneventful recovery, with the exception of a slight subcutaneous infection.

INTESTINAL INTUSSUSCEPTION IN AN INFANT: OPERATION, WITH RECOVERY

By A. H. Newton, M.D.
Yreka

INTESTINAL intussusception in infants apparently has no etiological agent. Intussusception occurs most frequently at the ileocecal juncture, where vigorous peristalsis is countered by antiperistalsis in the cecum. This may be a factor as to its genesis. Intussusception of the large intestine may be ileocecal, in which the head of the cecum forms the apex of the invaginated bowel. In the small intestine there may be ileocolic invagination, in which the lower ileum prolapses through the ileocecal valve.

I wish to report a case in an eight months old infant in which there was an ileocecal invagination, the cecum forming the apex of the invaginated bowel which developed into an ileocolic invagination; the ileocecal continuity of the intestinal lumen between the oral and distal segments remained intact until the day preceding surgery. My case report presented the four cardinal symptoms of intussusception: (1) periodic attacks of pain; (2) vomiting; (3) passage of mucus and blood by rectum; and (4) presence of a palpable tumor.

REPORT OF CASE

B. A., aged eight months, male; birth weight, 7½ pounds; weight on admission to the hospital, 21 pounds. Previous illness, none. Present illness: The patient was a normal, healthy, active baby prior to the onset of present illness. The patient was awakened from a sound sleep on Friday, November 27, 1936, with severe crying and evidence of abdominal pain. This was followed by bowel evacuation, and a few hours later vomiting ensued which was persistent with successive bowel movements of blood and mucus. Vomiting and bowel movements persisted through November 28, The patient was brought to the hospital on November 29, and examination revealed the infant to be dehydrated; temperature 105 degrees Fahrenheit, rectal. The abdomen was distended, and a palpable, movable mass was present in the left lower quadrant. The mass was felt by rectal examination as well. A diagnosis of intussusception of the descending colon was made.

The baby was taken to the x-ray department, and under the fluoroscope a barium enema was given from a suspended reservoir can three feet above the table. With

administration of barium enema into the bowel, there appeared to be obstruction at the descending colon, sigmoid junction. The obstruction seemed to be reduced by the bolus of barium, and we were able to get barium up to the hepatic flexure of the transverse colon. The baby was hospitalized, and during the next few days ran a fever of 101 to 102 degrees rectally, and fecal material obtained with enemas. The patient was able to retain, by mouth, two to three ounces of S. M. A. formula, seven feedings a day. He also retained water. His temperature subsided on the sixth day of hospitalization, but he continued to show evidence of partial bowel obstruction by distention, occasional vomiting and very little fecal material, and blood and mucus to be passed with the aid of enemas. On Saturday the patient developed more evidence of bowel obstruction. Repeated enemas were unsuccessful in relieving abdominal gas, the abdomen continued to become more distended, and he was able to retain less formula.

On Monday, December 7, I took the baby to the x-ray, and with a barium enema was only able to get the bolus up into the upper portion of the sigmoid colon. I could feel a definite mass along the descending colon. We felt this to be edema of the bowel, and that the patient's obstruction was due to this. On December 8 the patient developed a complete obstruction, and with his continued straining there appeared at the anus the bowel, which had slipped down through the rectal canal. The mucosa was covered with fibrin, and bled upon touching with the index finger. This was reduced with the gloved finger, and the mass persisted in the left lower quadrant. Examination with the sigmoidoscope was as follows: It was passed up to the lower half of the sigmoid, and edema at this point prevented no further passage.

On the evening of December 8 the baby was taken to surgery, and under ether-inhalation anesthesia low midline incision was made, and on opening the abdomen the small bowel was found distended. There was a bolus of firm material in the sigmoid colon which undoubtedly was intussusception. This bolus was pushed up with the finger through the entire length of the descending colon into the transverse colon and across the abdomen, and was lost at the hepatic flexure due to the extreme distention of the small bowel and the difficulty of preventing a complete eviseration. The cecum was then looked for, and considerable difficulty was found in locating it. The cecum was pulled down and was filled with intussuscepted ileum. The intussuscepted ileum made a mass in the cecum the size of a small orange, which was reduced. There was a great amount of edema of the distal end of the ileum and the cecum. A catheter, size 16, was then placed in the cecum through a cecostomy opening and threaded through the ileocecal valve up into the ileum for a distance of six inches. Purse-string sutures were laid in the cecum at the point of insertion. A stab wound was then made in the right flank and the catheter brought out through this wound along with anchoring silk sutures in order to hold the cecum to the anterior abdominal wall. The abdominal wound was then closed and the anchoring silk sutures were fastened with a button alongside the catheter. The baby was in good condition at the end of the operation, which consumed one and one-half hours. Bright yellow contents of the ileum flowed freely along with gas through the catheter.

The baby made an uneventful recovery. The catheter was removed on the sixth day postoperative. The incisional wound healed by primary union. All wounds were healed by the fourteenth postoperative day. The baby was discharged as cured from the hospital on the fifteenth postoperative day.

COMMENT

Intussusception of the ileum into the cecum, with intussusception of the cecum and ascending colon into the transverse bowel, and further intussusception of the ileum down into the descending colon. The apex of intussusception presenting itself at the anus with complete bowel obstruction. The gut was threaded back through the sigmoid, descending, and transverse colon down through the ascending colon, and reduction of the intussuscepted ileum followed by cecoileostomy with complete recovery.

County Health Office.

PAROTID AVULSION

ALMOST COMPLETE, WITH REPLACEMENT AND RECOVERY

By Bernard E. McGovern, M. D.
San Fernando

BECAUSE of some unusual features, report is made on the following case.

REPORT OF CASE

History.—A white, male child, twenty-two months old, was brought to my office in San Diego on June 5, 1936. His parents stated that he had fallen, face downward, on a freshly manured lawn while running with a drumstick in his mouth; and that he had bled freely from the mouth.

Examination.—There was a depression below the left zygoma in the area normally occupied by the parotid gland, but no evidence of facial nerve injury. There was a deep, curved laceration of the inner aspect of the left cheek, about two and one-half centimeters long, just dorsal to the orifice of Stenson's duct, producing a pedicle to which the duct was attached. Almost the entire left parotid gland was lying on the floor of the mouth, and still attached to Stenson's duct.

Treatment.—Fifteen hundred units of antitetanic serum were given intramuscularly. The patient was taken to the operating rooms of Drs. Ross O. Taylor and Lloyd Myers of San Diego, where he was anesthetized by Doctor Taylor, with the use of an ether-suction machine. Doctor Myers, with my assistance, flushed the wound with sterile, normal saline solution, and replaced the parotid gland through the laceration with forceps. The wound in the masseter and buccinator muscles and mucous membrane was closed with heavy silk sutures; and a silk suture was placed deeply into the gland substance, about three centimeters dorsal to the orifice of Stenson's duct, to form a fistula. A liquid diet was ordered, and the wound was touched every day or two with a two per cent solution of mercurochrome.

Progress.—There was moderate swelling below the left zygoma for several days after replacement. The rectal temperature did not exceed 100.4 degrees Fahrenheit until June 10, 1936, when it rose to 105.4 degrees Fahrenheit. The tonsils were acutely injected and swollen, and the crypts were filled with white plugs. The cervical glands were enlarged on both sides; and there was slight coryza. On June 11, 1936, there was moderate protrusion of the right anterior pillar and soft palate, with intense dysphagia. A diagnosis was made of beginning peritonsilar abscess; and on the next day there was a pus discharge from beneath the right anterior pillar. The temperature and dysphagia were rapidly receding. On June 13, 1936, the patient exhibited the general macular rash of measles. But the wound showed no evidence of infection at any time, and healed without incident.

On June 16, 1936, the stitches were removed, and there were two salivary fistulae at the site of the loop stitch that was put into the gland substance. Saliva was draining from Stenson's duct, as well as the fistulae. The temperature was normal; and the tumefaction had disappeared from below the left zygoma.

On August 16, 1936, saliva was still draining from the sites mentioned, and there was no evidence of salivary cyst in the parotid gland.

COMMENT

Almost complete avulsion of the left parotid occurred when a child fell while running with a drumstick in his mouth. Stenson's duct and the parotid gland were still attached to the cheek by a small pedicle. Recovery took place after replacement and suture. The child developed measles and peritonsilar abscess during convalescence, but no infection of the wound occurred.

1021 Mott Street.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

PREVENTION OF MENTAL DISEASE

I. ETIOLOGY

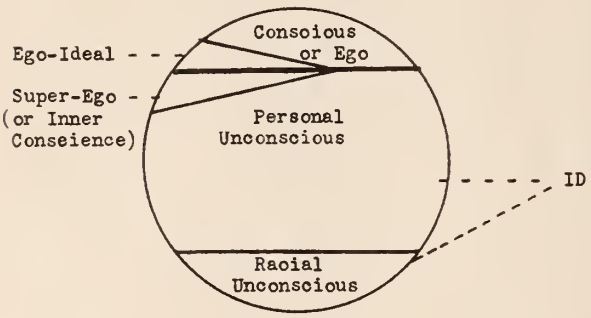
Glenn Myers, M.D. (1052 West Sixth Street, Los Angeles).—The infant at time of birth is the product of millions of years of influences in the past. Hooten[1] writes: "It has required some sixty millions of years to develop man from a small, long-snouted, quadruped tree dweller, equipped with a simple brain and mobile, five-digited grasping hands and feet. Such an amount of time in the life of the world is as trifling as that sum of dollars to a federal budgetary officer." Only those experiences which have been repeated over and over for long periods of time appear to contribute to heriditary equipment. Casual environmental influences have had little, if any, measurable effect, transmissible through germ plasm. The experiences of a lifetime may be regarded as generally all too transitory to modify inheritable characteristics. This is equally true of organic evolution, such as that of the central nervous system, and of function, such as entailed in what we call Mind. (The mind, of course, is not solely a function of the central nervous system, but has to do with biochemical-endocrine-physiological qualities, with the skin and muscles, and with environment.)

Incident to the preservation of life, our ancestors had much experience with fight and flight, hunger, sexual drives, love, hate and play. An infant comes into the world with instinctual capacities for such expressions, slowly evolved out of the past. They appear to be essentially the same in all persons, compared at least with others of their race and milieu. Factors may possibly be present at birth which predispose to the development of mental disorder. But psychosis, or even lesser mental disorder, in my opinion, is not per se inheritable. Such belief was formerly prevalent, but increased knowledge has proven the contrary in regard to one mental disease after another. Many good psychiatrists continue, for example, to believe that manic-depressive psychosis is transmissible hereditarily, but only a few die-hards still think that *all* mental disorder is so transmissible. The psychiatrist generally concedes that biochemical factors (as also endocrine and physiological factors) may influence mental illness and treats them accordingly, but concentrates upon intensive study of life's experiences in relation to total environment. Such study not only contributes to our store of knowledge, but has practical applications in treatment.

So-called "functional" mental disorder invariably depends in greater or lesser extent, but primarily, upon deviations from normal psychosexual development in the first years of life. (Organic brain disease, or toxic states, may produce solely organic effects, or in addition may precipitate "functional" expressions. The latter, if present, are based on life's experiences, and are not per se organic symptoms.) Environmental experiences gradually mould the personality, and such moulding begins to be apparent soon after birth. Habitual reactions soon become patterned from repeated environmental stimuli. The foundations of personality make-up are well laid by six or eight years of age. The superstructure built upon such foundations is subject to change, but the foundations remain essentially unchanged (unless through psychotherapeutic attack).

Normally, there is an orderly course of psychosexual development with certain well-defined stages. Space permits only brief mention, but the reader may find satisfying elaboration elsewhere.[2] Briefly, it may be said that, at birth, the infant is a somatic structure, the mental component of which consists essentially of an instinctual reservoir, from which instinctual qualities flow under the influence of environmental experiences. Through study of children, and through histories of their childhood given by adults, it has been learned that psychosexual development proceeds normally through stages designated Oral, Anal and Genital. During the nursing period, the Oral zone is invested (cathected) with pleasurable qualities. The first frustrations are also experienced during the nursing period, e. g., through delay or failure in satisfaction of hunger. Weaning may be a traumatic event, if the child expects indefinite continuation of nursing and its termination is abrupt. Next the instinctual stream begins to be cathected in the Anal zone. In the latter part of the Anal stage, the child discovers its genitals, and the Genital zone becomes cathected with qualities flowing from the reservoir of instincts or passed on from the Oral and Anal zones.

The earliest formation of the Psyche comprises awareness of the somatic zones mentioned in the foregoing, and its earliest functions serve to maintain the integrity of the aims of these zones. The child learns something of tenderness and love from the mother. She is the first object-choice toward whom his love is directed. The stream of the instincts becomes invested in the Psyche, a quantum remaining invested in each of the somatic zones. There is still little appreciation by the child of differentiation between mother and himself. Such differentiation will depend upon later deprivations. Restraining influences tend to come particularly from the father, and are directed against the unbridled freedom of the tendencies of the instincts. Gradually the child learns to bring instinctual drives



[1] "From Apes, Men and Morons," Earnest A. Hooten, Prof. of Anthropology, Harvard Univ., G. P. Putnam's Sons, New York, 1937.

[2] "Common Neuroses of Children and Adults," O. S. English, M.D., and G. H. J. Pearson, M.D., W. W. Norton & Co., New York, 1937.

into channels that are acceptable to father and mother. He begins to distinguish between himself and his environment. He begins to develop a conscience. Conscience depends upon the parental attitudes, the don'ts of the parents, their teaching of good and bad, proper and improper, right and wrong. After a time, the dictates of the conscience become automatic.

All to the foregoing takes place in the first four or five years of life. From a stage of complete self-love (primary narcissism), the child comes to a stage of submerging self-love in favor of consideration of others, this in turn providing satisfying outlets for instinctual drives. He absorbs first the attitudes of his parents, and next the attitudes of his teachers and others who teach socialized habits and attitudes. He reflects the attitudes of those he wishes to emulate, and begins to manifest an approved social attitude. He establishes approved relationships with Reality—the world around him. He establishes the beginnings of ideals and converts powerful instinctual drives into acceptable and approved conduct and activities (sublimation). Through marriage, genitality is socialized. He has gradually become adult.[3]

An explanation of the Structure of the Mind can best be made with the aid of a diagram:

Using a circle to represent the mind as a whole, at birth only the portion designated Racial Unconscious exists. This is the instinctual reservoir, the effects of strivings in the past for preservation of life. It begins at once to give off streams of instinctual energy which go into channels mentioned above. As the infant grows older, he gradually becomes aware of having instinctual forces within himself, but the Racial Unconscious always remains per se unconscious.

Through environmental influences, the circle gradually fills in. Each experience produces a memory impression. Memory impressions are never lost, but we go through a process of forgetting, and they so pass into the Personal Unconscious. The most important factor in such forgetting depends upon the tendency to remember pleasant experiences, and to forget unpleasant and painful ones. Experiences may be had which are so unpleasant and difficult as to be unmeetable. There is then the tendency to thrust the memory impression abruptly out of the Conscious into the Unconscious. This is called "repression." Repressed memory impressions, as long as they remain unconscious, continue in the same unadjusted state, and with the same charge of emotion that was existent at the time of enforced and generally sudden forgetting. Such forces within the Unconscious tend to unrest and disadvantageously influence thinking and acting. They interfere with or prevent full development of personality.

As a result of the various factors which bring forgetting, there remains relatively little to that portion of our diagram designated Conscious, the part of the mind having to do with awareness and ready recall. No matter how well organized the Conscious mind, we are ever influenced by the Unconscious, particularly by its instinctual strivings and repressed content. Consciously we have no knowledge of the content of the Unconscious. The mind has been aptly compared to an iceberg, the relatively small portion above the water corresponding to the Conscious and the bulk under the water corresponding to the Unconscious. We cannot see far beneath the surface of the water; the Conscious cannot comprehend the Unconscious. Furthermore, the potentialities of the Unconscious correspond to those of the iceberg beneath the surface. The Unconscious as a whole is called the ID.

The remaining portion of our diagram shows the Super-Ego and Ego-Ideal. They are essentially one, but the Ego-Ideal is that portion which represents wishes and aspirations that remain conscious, whereas the Super-Ego is that portion which has become automatic and does not depend on conscious thinking. Fundamentally, the Super-Ego is the attitudes of the parents, and it is as if the parents are always with us, within the Unconscious, telling us what to do and what not to do—the inner conscience.

Obviously, the relationship between these parts of the mind is important. Through the Conscious, or Ego, we attempt to make satisfactory adaptations to the world around us, *i. e.*, to Reality. To such end the Ego must guard against instinctual drives and repressed forces from within the Unconscious. The Super-Ego (the internalized parents) reinforces the Ego in adaptations to Reality, but, because fundamental concepts constituting the Super-Ego were derived during the immaturity of childhood, they may be distorted and out of line with reasonable facts. The Super-Ego in consequence may be exceedingly severe on the Ego. The Ego may thus be in a very difficult position in attempting to make satisfactory compromises between forces from the Unconscious, particularly from the Super-Ego, and demands of Reality. Under such forces the Ego may become weakened to the extent that its functions are considerably overpowered, in which event there is loss of contact with Reality, and the consequent state is termed Psychosis. Or the Ego may be weakened to lesser extent, so that contact with Reality is retained, but lesser degrees of mental disorder than Psychosis are released.

There are certain crises in every life, such as at puberty, on leaving school, during a love affair—through disappointment or frustration—on marriage, at the time of bearing or fathering a child, at disappointments in vocational or financial life, at the loss of a loved person, and during the involutional

3 "Syllabus of Psychiatry," Leland E. Hinsie, M.D., State Hospitals Press, Utica, New York, 1933.

period. If psychosexual development has not progressed normally well and mental instability consequently exists, one will tend to become mentally ill, when he encounters such crisis. If psychosexual development has been along sufficiently normal lines, he will meet the difficulties with the best compromises possible, and will remain mentally well.

* * *

II. PROGNOSIS AND TREATMENT

J. M. Neilsen, M.D. (*727* West Seventh Street, Los Angeles).—While in the general consideration of human disease diagnosis and prognosis have been associated, the latter dependent almost entirely on the former, in so-called mental disease prognosis has become intimately associated with treatment. At the same time diagnosis has undergone radical changes, especially from the static to the dynamic, and descriptive terms have become substituted for the old-fashioned static diagnoses. The prognosis and treatment of mental disease, therefore, will be considered together.

Psychotherapeutic Procedures.—Psychotherapeutic procedures are of greatest importance in the psychoneuroses, and are not entirely without function in the psychoses. They consist in assisting the patient with an analysis of his personality and adjustment problems, correction and guidance in the resynthesis, as well as help in every phase and ever-present encouragement and sympathy. The prognosis in a given case depends upon the thoroughness with which this is done, the ability of the patient to coöperate, and the means available.

Analysis.—The greatest dissension in the ranks of psychotherapeutists occurs in the realm of analysis of the personality and adjustment problems. Here we find the well informed and wise family physician listening to the difficulties as presented to him, mulling them over in his mind and rendering a verdict without further formality, yet in many instances obtaining good results. We also find many abbreviations of a formal psychoanalytic procedure, some therapeutists making use of fractions of Freud's method, others using what they claim to be their own, down to the "orthodox" Freudian technique lasting as long as five years or even more.

Much valuable time is wasted in discussions concerning the question of method, as though methods were inanimate things which function equally well regardless of the operator. Sight is lost of the fact that, while a complete psychoanalysis according to the Freudian school, practiced by a physician himself free of bias and complexes, is excellent, such never occurs for lack of the perfect analyst. Freudian analysts who rise to defend the method are often themselves palpably psychoneurotic, and show this by becoming vehement against dissenters. It is far more important to place the patient in the hands of the proper man than to subject him to the proper method, the man being the most important element in execution of the method.

So good a therapeutist as H. Douglas Singer writes in Tice's System of Medicine regarding analysis in cases of psychasthenia that his trouble has been to know where to stop. The analyst may unearth more complexes which have long been successfully sublimated than he can aid the patient in discarding. Psychoanalysis is notoriously of little value in obsessive ruminating states, even when the method is used by the best of men.

Orthodox psychoanalysis as a method is retained in our armamentarium, but as an instrument to be used is rarely recommended. The well informed and well balanced physician who has good judgment usually finds some far shorter method of handling the problem. Much of what Freudians claim is deeply buried in the unconscious is found on analysis to be superficial and easily discovered.

Resynthesis.—After the analysis is complete (or during it) by whatever method this has been reached, comes the all-important item of synthesis. Just as it is far easier to dismember a fine watch than to reassemble the parts, so is it far easier to point out to the patient his errors than to plan for him a course which will be successful. In assembling a watch one knows that it is apt to run if all the parts have places into which they seem to fit, but in reassembling a personality one wishes to omit parts which formerly were there, and replace with new parts of a different character, which are supposed to function better than the old ones. It takes far more wisdom in the resynthesis than in the analysis.

It is therefore clear that in the handling of adjustment problems the prognosis is intimately linked with the factors in the treatment. Prognosis depends not only on the character of the individual who has acquired the disease, how severe the disease has become, and on the method selected by the therapeutist, but far more on the ability of the physician himself. In the best of hands the patients with the psychoneuroses known as neurasthenia, psychasthenia, and hysteria, as well as those with the numerous personality and adjustment problems which are not specifically named, are subject to considerable improvement by the physician. Psychasthenia has a constitutional element in its very nature, and is, therefore, seldom, if ever, eradicated; but the individual affected may be greatly helped. Freeman and Watts have recently attempted to relieve obsessive-ruminative disorders by prefrontal lobotomy, but the success is not yet sufficient to recommend the procedure as routine.

Hysteria is very deeply rooted in a person and difficult to eradicate, but the hysterical episode is easily attacked and usually corrected. Suggestion and hypnosis are of little permanent value even though they startlingly appear to effect a cure. Far more permanent is the correct portraying of the patient to himself, and the removal of the difficulty for which the hysterical manifestation is the substitute.

In the treatment of the depressive phase of manic-depressive psychosis, psychotherapy is of distinct support to the patient and may often prevent suicide. It is doubtful whether the course of the attack is materially shortened, but it is certainly made far more endurable by persistent encouragement. In the manic phase it does little good to talk, as the patient's distractability and flight of ideas make him incapable of receiving advice.

Relative to dementia precox there are still those who believe that psychotherapy is of value. To the writer it is somewhat amusing to see a psychoanalyst attempting to make an intellectual approach to the incontinent deteriorated patient. On the other hand, in the case of the mildly affected individual who is hospitalized only occasionally guidance is certainly of value.

Physico-Chemical Measures.—Among *physical* measures "hydrotherapy"—which in many instances is not hydro (water) therapy at all, the water being merely the physical agent which carries the heat to or from the patient—has much vogue. It is true that an alternate hot-and-cold percussion douche up and down the spine, always ending with cold, is of use in starting a depressed patient on the day's work in the morning, and that a neutral bath (water 95° F. to 98° F.), or a neutral pack is of use in quieting the agitated patient; but the value of the much advertised hydrotherapy has been greatly exaggerated. At the same time that restraint has been relegated to the past by leaders in therapy of the mental diseases sight has been lost of the fact that much of the value of the neutral pack or neutral bath lies in the restraint necessary to keep the patient in it. The other element is the constant temperature maintained about the skin.

Rise of temperature as such is not well accomplished by means of water. When fever therapy is indicated, as in general paresis, immersion in water is not good; hot air or hot blankets or other external application of heat is preferable to the use of water. In mental disease due to syphilis, fever therapy is certainly indicated in selected cases.

Chemical therapy concerns chiefly the use of drugs in the treatment of syphilis in the psychoses. The details of this form of treatment cannot be entered upon here. Suffice it to say that the prognosis of general paresis by tryparsamide therapy, combined with bismuth and the iodides, has been greatly improved. By carefully applied thermotherapy it is probably slightly better still. By a combination of both it is even better.

Sedatives are much used, and probably indispensable in the treatment of the psychoses. In acute mania they are imperative to prevent patients from wearing themselves out. I have administered to a patient in such condition eight doses of H. M. C. No. 1 (containing morphin sulphine gr. ¼ plus hyoscine HBr. gr. 1/100 each) and sodium amytal gr. xxxvi in twenty-four hours, without producing sleep but a peaceful mental state. After four days of this the patient became clear and remained so. This is cited for those to criticize who do not believe in sedation by chemicals. Sedatives are in some localities greatly overused, and it is a good policy to use as little as possible. Certainly the method common two decades ago, by which the attendants poured out the doses of bromide instead of measuring them, is not to be condoned. Moderate sedation for insomnia in cases of agitated depression is indicated, and does much to prevent suicide during the hours of silent agitation in the night, especially in private practice. The habit-forming drugs are to be avoided. Recently it has been discovered that insulin in doses below those producing shock, followed by adequate feeding, has a soothing effect on disturbed patients. Insulin, by this method, is also of value in alcoholic psychoses and in increasing nutrition in the emaciated.

Recent Advances in Treatment of the Psychoses.—Sodium ricinoleate, insulin and metrazol. The recent stir about insulin treatment for dementia precox has so displaced former methods of treatment of that condition that one has nearly lost sight of the former methods which were almost as successful. The use of castor oil administered daily for several months, and then less often for more months, was reported as fairly successful by a Los Angeles physician as early as 1931. Shortly afterward the similar use of sodium ricinoleate was reported from the East as a separate discovery. The two methods are the same, the latter drug being merely the sodium derivative of castor oil. With this method of treatment acute cases of dementia precox would terminate in recovery in about 70 per cent of cases, but *it took one to two years.* Careful feeding with high vitamin diet was also necessary.

Insulin Treatment.—The great advance in the treatment of dementia precox by insulin lies in the shortening of the time from the above mentioned period of one or two years to two months. The treatment is also correspondingly dramatic and dangerous. Like the treatment with sodium ricinoleate, improvement *mentally* is accompanied by simultaneously marked improvement in the *general physical condition* in every case.

The treatment, as outlined by its discoverer, Sakel, consists in the daily (one day a week excepted) injection intramuscularly of a relatively large dose of insulin sufficient to cause coma, from which the physician restores his patient by administration of glucose. The same error concerning this treatment was made as was made in psychoanalysis; it became ritualized and constrained by dogma ostensibly for the purpose of controlling the novice. Much of the original dogma has already been changed. The alteration in dogma after only three years would indicate its prematurity.

The reasons for the impossibility of retaining any ritual or dogma is simply that the reaction of any patient to a dose of insulin depends on a great number of factors. The balance or imbalance of his endocrine system, and the particular way in which his chemical organization is peculiar, his state of nutrition, the tension or relaxation of his nervous tone, the amount of musculature, the amount of glycogen in the muscles and liver, and additional factors still unknown, all contribute to this. A given patient does not only react unlike any other patient, but even unlike his own reaction of the previous day. When one has observed a certain behavior on the part of a given patient for several days, and one concludes that "now that patient is understood," there is certain to be a deviation compelling one to discard all ideas of fixity. For these reasons the following is only a very broad generalization to which there are numerous exceptions.

In general, if the dose given has been adequate, the patient (without breakfast) will begin to perspire in about one to three hours after the administration of the insulin. He will then become drowsy

and later excited, or the excitement will come first. In the excitement there is apt to be a great deal of tossing and twisting with writhing, torsion, moaning, or yelling. After a time myoclonic jerkings appear involving first the mouth area, then the extremities and perhaps the trunk. Following this period of agitation, the patient usually becomes quiet, although the violence may be repeated several times. When quiet does supervene there is a lull which may be ominous.

The apparent peaceful calm may continue until coma becomes profound and respiratory disturbance supervenes, or an epileptiform seizure may suddenly change the entire picture. (The epileptiform seizure may occasionally come very early in the treatment, even before drowsiness.) Or the patient may develop decerebrate rigidity more or less complete. Any of these events calls for immediate termination of the episode.

Termination is by intrastomachic instillation or intravenous injection of glucose. The choice is determined by experience or by urgent necessity. It may be almost impossible to administer intravenous injection because of the writhing or tossing, yet the more violent the reaction, the more urgent is the termination. If there is evidence of pulmonary edema intrastomachic instillation is contraindicated. The patient usually arouses within twenty to thirty minutes after glucose reaches the stomach, sometimes earlier, or within five minutes after intravenous injection. He is then clear mentally and hungry, and asks for his dinner.

The dosage necessary for this reaction lies between ten and five hundred units of insulin given without breakfast in the morning. Only regular insulin can be used; the protamin or zinc insulin is contraindicated. The individual dosage is determined by trial.

Dangers.—The dangers of the insulin treatment are many. In the first place, patients with arteriosclerosis and with any serious organic disease of the heart are bad risks. The adrenalin produced by the body in response to the insulin may raise the blood pressure to dangerous heights, or cause spasm of the coronary arteries. In "perfectly healthy" patients (they are never perfectly healthy, if they have dementia precox, but if there is no organic disease in the usual sense they are perfectly healthy for the treatment), there are still serious dangers. The most common is circulatory collapse. In this condition the veins collapse so that intravenous injection is almost impossible just when it is most urgently needed. It is usually possible to restore the patient with circulatory stimulants, and treatment can be continued the following day.

The most serious danger is pulmonary edema. Minor degrees of this condition are common, but serious cases are frequent enough to make the therapeutist extremely wary at all times. The patient may suddenly cough up as much as a pint of fluid evidently from the lungs as judged by its frothy, acid-free, and blood-tinged nature. Râles are then heard throughout the chest. Severe, even extreme, cyanosis appears, and the patient may be dead in a few minutes. Large doses of intravenous glucose, morphin by hypodermic injection, coramin intravenously and oxygen inhalation may still save the patient. But all must be done very quickly.

Another danger is prolonged coma from which it is impossible to rouse the patient. It has been reported that intravenous injection of vitamin B1 may restore him, but with this the writer has no personal experience. In fatal cases the patient simply remains in coma for some days, and peacefully dies.

Less common, but still to be reckoned with, is pulmonary embolus. This seems to arise in the veins of the arm after intravenous injections. Minor dangers are those incident to epileptiform seizures, such as suffocation or fractures due to the violence.

Metrazol.—The production of epileptiform seizures by the intravenous injection of metrazol has given almost as good results as insulin treatment. It is simpler, but more dangerous to the patient, chiefly because of fractures and dislocations. The treatment consists merely in the injection intravenously every other day to an alkalinized patient enough metrazol to produce a convulsion. The resultant seizure is immediate and is ushered in by a wide yawn which quite often dislocates the jaw. All complications (as all benefit) seem to be the direct result of the seizure.

Prognosis with Insulin or Metrazol.—In the treatment with these measures the prognosis of dementia precox has been entirely altered. Whereas such results could formerly be obtained only after one to two years, they are now available in two months. In old cases (of long standing), or in old patients, the prognosis is not nearly so good. In fact, while in the acute cases in young persons the outlook is for 70 per cent recovery, in the old cases in old persons it falls to 10 per cent or less. However, such was the ultimate figure by the old method also.

In conclusion, one can summarize the difference between the former and the new treatment of mental disorder by saying that symptomatic treatment has given way to the physiological and psychological approach. The patient, instead of the disease, is now treated.

* * *

III. MEDICO-LEGAL PROBLEMS INCIDENT TO THE CONTROL OR COMMITMENT OF THE INSANE

Mervyn H. Hirschfeld, M.D. (450 Sutter Street, San Francisco). — The medical management of a mentally disordered individual is frequently complicated by the patient's refusal to cooperate. When confronted with this difficulty, it is important that the physician realize the limitation which the law places on his authority to act without the consent of the patient.

In those instances where the person is demented, confused or otherwise mentally so incapacitated that he is unable to express his desires, the next of kin or nearest friend may empower the physician to remove the patient to a suitable place for treatment. When the same degree of mental impairment develops while the person is under treatment, it is the right and the duty of the physician to continue to exercise his best judgment in the conduct of the

case, until responsibility has been assumed by those legally authorized to do so.

Tactful handling will dispose of many problems. The assurance with which the physician acts—his poise and his ability to gain the patient's confidence —are important factors in persuading him to accept hospital care and restraint. Hallucinations and delusions are real to the victim, and usually should be accepted with apparent emotional indifference. Any show of anger, excitement, fear or uncertainty must be avoided. Subterfuge in inducing a patient to enter a mental hospital is usually unwise, not only because it may destroy his confidence in the physician, but he may demand his release at any time and the institution is without power to hold him against his will. At times the medical attendant, confident of the moral justification of his act and having the undivided support of the individual's family, may forcibly place a patient in a hospital. The courts, bound by the constitutional guarantee that no individual shall be deprived of his liberty without due process of law, do not authorize such action. Legally, the person remains sane until declared otherwise in a prescribed manner. The physician who assumes such authority exposes himself to the danger of suit on a criminal charge, an action which is not covered by his malpractice insurance. In such cases even if he successfully defends himself, he incurs the expenses of attorney fees and court costs, and may even have to file expensive briefs and other documents in appeals to higher courts. The same hazards are incurred by the institution which detains the person under such conditions.

Violent and maniacal subjects may force one to call for police assistance, the patient being apprehended on an appropriate charge. The magistrate before whom he is brought may order his removal to the detention hospital or such quarters as the county provides, and lunacy proceedings are thus instituted.

In order to secure legal authority to restrain a person who is mentally ill, it is necessary to follow the procedure laid down in the laws of the state in which the action is brought. In California the routine is as follows. When the State hospital care is not desired, suit may be filed in Superior Court of the county to have the person declared incompetent and to have a guardian of his person appointed. The patient must be served with a citation and, if physically and mentally able, he must appear in court. If it is alleged that he is not able to do so, the court appoints two physicians, not previously interested in the case, to examine him. If satisfied, the court signs the order and the patient may be legally detained and treated according to the decision of his guardian.

When State hospital care is requested, one must obtain a warrant for apprehension and examination for alleged insanity. This is procured either from the district attorney's office or from a clerk of the Superior Court. When sworn to before a judge of that jurisdiction, the patient is taken to the designated place of detention where he remains for forty-eight hours under the observation of two physicians appointed by the court. Within twenty-four hours of his arrest he is informed by the judge of the charges, and his legal right to witnesses, attorney, and jury trial. It is only rarely that the patient demands such procedures, but the possibility of this eventuality must be kept in mind when proceedings are contemplated. Lay juries are reluctant to declare a person insane, and unless the mental abnormality is obvious, commitment may be impossible. The situation may be further complicated by the patient's ability to suppress or conceal his delusions for a time, particularly when kept under control by an adept attorney. When the action has been successfully terminated, it is possible to have the patient paroled to a suitable person who may then place him in a private hospital. This method of handling the matter of obtaining guardianship of the person has the advantage of avoiding the expense of the previously described course.

It is unfortunate that those afflicted with mental disease must be subjected to the distressing experiences of any type of incompetency proceeding. Under the law, as it now stands, it is compulsory for those whose circumstances dictate placement in a public mental hospital. In the majority of other cases it can be avoided, and the risk of subsequent legal action on the part of the patient is slight, but must be taken into consideration. A fully recovered patient has insight into his illness and appreciates the necessity of hospitalization, but the paranoid individual who has learned to hide his delusions and has made sufficient adjustment to be released from the institution, is dangerous.

A Further Evaluation of Artificial Pneumothorax in Lobar Pneumonia: Chairman's Address.—Francis G. Blake, New Haven, Connecticut (*Journal of the American Medical Association,* August 13, 1938), says that in previous reports on the treatment of lobar pneumonia with artificial pneumothorax it was pointed out that no evidence of beneficial effect on the duration or outcome of the disease was obtained in late cases of more than seventy-two hours' duration or in earlier cases with pleural adhesions which prevented adequate collapse and immobilization of the involved lung. Thirty additional cases have been treated. Analysis of the results in these additional cases serves to confirm the limitations previously pointed out. Summarizing his observations Blake says that, in all, seventy-two patients with lobar pneumonia have been treated with artificial pneumothorax in an effort to evaluate the therapeutic usefulness of this procedure. It has been found to be of no value (1) in late cases of more than seventy-two hours' duration and (2) in earlier cases with pleural adhesions which interfere with adequate collapse of the lung. These two facts alone would seriously limit its field of possible usefulness, even were it of value in early cases without pleural adhesions, since many patients do not present themselves until late and adhesions are found in approximately 30 to 40 per cent of early cases. A further important limitation is the fact that it has not been found to exert a demonstrable effect on an established bacteremia nor does it necessarily prevent subsequent invasion of the blood by pneumococci. Although the course and outcome in the majority of thirty-three early cases without adhesions would appear, on first analysis, to have been beneficially modified by treatment with artificial pneumothorax, a careful evaluation of other factors which might have been responsible for the apparently good results renders such a conclusion untenable. The author reaches the conclusion that artificial pneumothorax appears to be of value for the relief of pleural pain in selected early cases of lobar pneumonia. It has not been demonstrated that it possesses any curative value in this disease.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

SPECIAL SESSION OF HOUSE OF DELEGATES OF THE AMERICAN MEDICAL ASSOCIATION

Below appears copies of correspondence received on Saturday, August 27. Copies were immediately sent to all component county societies and to the California delegates and alternates to the American Medical Association.

* * *

(Copy)

WESTERN UNION

Chicago, Illinois,
August 27, 1938.

California Medical Association,
Dr. George H. Kress, Secretary,
450 Sutter Street,
San Francisco.

The Speaker of the House of Delegates of the American Medical Association has called a special session of the House of Delegates to be held in Chicago September 16, 1938.

Copy of the official call is being forwarded.

Please advise other officers, and members of official bodies of your Association, as well as general membership so far as possible. (Signed) OLIN WEST,
Secretary, American Medical Association.

(Letter Concerning the Call for an Extra Session)

AMERICAN MEDICAL ASSOCIATION

Chicago, Illinois,
August 27, 1938.

Dr. George H. Kress,
Secretary, California Medical Association,
San Francisco, California.

Dear Doctor Kress:

I am enclosing a copy of the call issued by the Speaker of the House of Delegates for a special session of the House of Delegates to be held in Chicago, September 16, 1938. You are respectfully requested to use available means for informing the members of your state association that this special session of the House of Delegates is to be held.

A copy of the Constitution and By-Laws of the American Medical Association has recently been sent to the secretary of each constituent state and territorial medical association. I respectfully suggest that you examine those sections of the Constitution and By-Laws pertaining to the House of Delegates and to the selection and registration of delegates.

At a meeting held in Chicago it was suggested that the officers of constituent state and territorial medical associations might consider it advisable to have meetings of their councils for the purpose of conferring with delegates who will represent the state associations at the special session of the House of Delegates of the American Medical Association.

It now seems quite possible that the secretaries and editors of all constituent state medical associations will be invited to attend the special session of the House of Delegates to be held in Chicago on September 16 and that the annual conference of Secretaries of Constituent State Medical Associations will not be held this year. You willl be definitely advised about this at the earliest possible time.

It is highly desirable that each constituent state and territorial medical association be fully represented by delegates selected in accordance with the by-laws of the constituent associations and the Constitution and By-Laws of the American Medical Association. The necessary railroad and Pullman fares and a per diem of $5 will be provided for each delegate attending the special session.

Present plans contemplate that the special session of the House of Delegates will be held at the headquarters building of the Association in Chicago.

535 North Dearborn Street.

(Signed) OLIN WEST,
Secretary, American Medical Association.

(Copy of the Official Call for the Extra Session)

To the Members of the House of Delegates of the American Medical Association.

In compliance with the official request of members of the Board of Trustees that the House of Delegates be convened in special session, I, as Speaker, under authority of Chapter III, Section 2, of the By-Laws hereby officially call the House of Delegates of the American Medical Association to convene in special session in the City of Chicago, State of Illinois, at 10 a. m., daylight saving time, on the sixteenth day of September, 1938.

The business to be transacted at this special session shall be limited to the consideration of the national health program submitted to the National Health Conference recently held in Washington and to such other matters as may be submitted to the House of Delegates by the Board of Trustees.

The House shall remain in session, recessing from day to day, until its deliberations are concluded.

This call is issued August 26, 1938.

(Signed) H. H. SHOULDERS, M. D.,
Speaker, House of Delegates,
American Medical Association.

EXECUTIVE COMMITTEE: CALIFORNIA MEDICAL ASSOCIATION*

Digest of Minutes of the One Hundred and Sixty-Fifth Meeting of the California Medical Association Executive Committee

Held in the offices of the Association, 450 Sutter Building, San Francisco, Saturday, August 13, 1938.

1. Dr. T. Henshaw Kelly, San Francisco, was elected chairman.

2. Minutes of the organization meeting of the Council held on Thursday, May 12, 1938, at Pasadena, were ordered to be referred to the Council.

3. Minutes of the special meeting of the Council held on Saturday, June 12, 1938, at San Francisco, were referred to the October 1 Council meeting for approval prior to publication.

4. Report was made that the 1939 annual session dates, (Monday, May 1 to Thursday, May 4, inclusive) were satisfactory to the Hotel Del Monte management.

5. The date of the next Council meeting was set for October 1 and 2, 1938, at San Francisco (a two-day session).

6. Arrangements were made for a conference between Farm Bureau representatives and members of the Council, to be held on October 1 at San Francisco.

7. The annual joint conference of secretaries of Component County Medical Societies, and officers and councilors of the State Association was set for Los Angeles; exact date to be decided later.

8. Financial statements were presented and approved.

9. Report was made that the local Committee on Arrangements for the recent American Medical Association's annual session at San Francisco had refunded the sum of $1000, which had been allocated by the California Medical Association for use in case the same should be needed.

10. Report was made that the income for the current year from the Herzstein Bequest had been received, and in the amount of $832.96.

11. Approval was given to the work of the California Society for the Promotion of Medical Research.

12. Thanks were tendered Dr. Anthony Diepenbrock for his services as referee in the recent hearing for the San Mateo County Medical Society.

13. Report was made concerning the recent conference between the State Association Secretary and the Los Angeles County Grand Jury concerning the advisability of an Institutions Commission for the County of Los Angeles.

14. Report was made concerning the proposed studies by the Neuropsychiatry Section's Committee on Mental Hygiene. It was pointed out that all proposed legislation must be first submitted to the constituted authorities of the State Association before being presented to the California Legislature.

15. Request for funds for a scientific section's special committee was not granted because of financial policies involved.

16. Report was made concerning the appointment of a subcommittee on pneumonia control, to work under and with the Standing Committee on Health and Public Instruction.

17. Report was made concerning a proposed "Academy of Graduate Study of California" submitted by Dr. C. A. Broaddus of San Joaquin County. The project was referred to the Committee on Postgraduate Activities for study and report.

18. Authority was given to allocate books not needed in the central office of the Association to libraries of component county medical societies, provided book reviews would be submitted.

19. Action of the Editor in withholding from publication items in conflict with the Council's rules as outlined under Item 13 of the brochure, "Suggestions to Authors," was approved.

20. Authority was granted to publish a Community Chest story, provided it was of state-wide appeal.

21. Component county societies were urged to expedite the collection of data concerning the American Medical Association survey on medical care.

22. Several recently organized medical and hospital care organizations were discussed.

23. Status of the California Forestry Medical Service was considered.

24. Membership status in county, state, and national medical associations, with particular reference to situations in which county society by-laws were not in harmony with those of the California and American Medical Associations, was discussed.

25. Resolution passed by the House of Delegates at the Pasadena annual session, entitled "Resolution to Establish a Committee Outlining General Policies of Medical Profession," was referred to the Committee on Public Relations for consideration.

26. A recent ruling of the Attorney General of California regarding legal status of internes under the Medical Practice Act was discussed, and further study authorized.

27. Federal and State Unemployment and Capital Stock taxes were discussed by the committee, and instructions given to the Legal Counsel of the Association.

28. Report was made by the Legal Counsel concerning the cases of *Engleking* vs. *Carlson* and *People* vs. *Pacific Health Corporation.*

29. Letter to the Council from former Association Secretary Warnshuis was referred to the Council for consideration.

30. A statement for use of Association's addressograph was ordered sent to the Medical Problems Group.

31. Association Secretary was instructed to write the Western Safety Council offering the coöperation of the California Medical Association.

32. Distribution of remaining copies of the "Cancer Studies of the California Medical Association" was authorized.

33. The matter of a cancer exhibit at the Golden Gate International Exposition was referred to Chairman Kilgore of the Cancer Commission for study and report.

34. Communication from the Secretary of the Section on Industrial Medicine proposing a change of name was referred back, with the suggestion that the proper resolution be submitted at the next annual session for consideration by the House of Delegates.

GEORGE H. KRESS, *Secretary.*

Attest:

T. HENSHAW KELLY, *Chairman.*

* The docket of the one hundred and sixty-fifth meeting contained ninety-one items. Notes are made concerning more important topics considered.

MEETING OF CALIFORNIA MEDICAL ASSOCIATION COUNCIL, OCTOBER 1–2, 1938

The Council of the California Medical Association will meet in San Francisco on Saturday, October 1. Plans have been made for a two-day session.

COMMITTEE ON POSTGRADUATE ACTIVITIES

Digest of Minutes of Meeting Held in San Francisco August 27, 1938

Members present were: Doctors John C. Ruddock, Los Angeles, Chairman; Frederick F. Gundrum, Sacramento; Francis E. Clough, San Bernardino; George H. Kress, San Francisco.

1. It was voted that Dr. George H. Kress be elected to the position of secretary of the Committee on Postgraduate Activities.

2. Concerning scope of activities to be carried on during the present fiscal year, it was voted that these be essentially the same as outlined on page 5 of the CALIFORNIA AND WESTERN MEDICINE Supplement of November, 1937, entitled "Five-Year Study Program for Graduates in Medicine."

3. The members agreed that the Postgraduate work should consist largely of clinical presentations. Clinical material to be supplied as far as possible by the local physicians. Didactic presentations only as needed to properly emphasize the clinical exhibits.

4. County hospitals were voted as being best adapted for the proposed clinics. Where county hospitals were lacking in ample facilities the conference could be held at the private hospitals. Both the above lacking in accommodations, halls of fraternal orders might be considered. Occasionally doctors' offices could be used, but only when necessary. Attention is called to the advantage of meeting places where dinners can be served in order that attending physicians may be present at the late afternoon meetings, to be followed by dinner and round-table discussions, with subsequent clinical presentations afterward.

5. Concerning local contact or liaison representatives from county medical societies it was suggested that such local committeemen or representatives should be suggested who were sufficiently interested to make possible their continuation in such office for a period of several years, because the State program contemplated a five-year procedure in which it was desirable to have experienced contac: men to give aid. Such committeemen to have authority to appoint assistant or advisory members to aid. The communications with the central office of the California Medical Association and with the Committee on Program Activities to be through the representative of the county society who is acting as the liaison or contact representative.

6. For better purposes of administration, Dr. Francis E. Clough, 491 Fifth Street, San Bernardino, was given the district including San Diego, Imperial, Riverside, San Bernardino, Inyo, and Orange counties; Dr. John C. Ruddock, 1930 Wilshire Boulevard, Los Angeles, was given the district including Los Angeles, Ventura, Kern, Santa Barbara, and San Luis Obispo counties; Dr. Frederick F. Gundrum, 1127 Eleventh Street, Sacramento, was given the remaining counties throughout the state.

Postgraduate representatives of county societies are to feel free to contact these three district officers, as well as the Association Secretary, concerning plans for clinics. As to the financial background of clinics, the State Committee on Postgraduate Activities will underwrite the necessary expenses incident to plans that have previously received the approval of the State Committee; provided, however, that local committees are supposed to set up a registration fee schedule that will approximate anticipated expenses.

In cases where an excess is left from registration fees, the same is to be held under local supervision as a separate fund for utilization in subsequent postgraduate conferences. Report thereon to be always made to the State Committee on Postgraduate Activities.

7. Expenses of guest speakers who come long distances will include ordinary railroad fare, Pullman reservation, and meals on train. If clinics cover more than one day, hotel room and meals will be included. No specific honoraria to speakers, except by previous arrangement, each such case to be considered individually.

8. Concerning sequence of postgraduate activities, it may be possible, where adjoining counties or districts have worked out suitable plans, to provide clinics which could be held one or two days in one place, in a separate locality, on the succeeding day, and, should occasion arise, the clinics in additional places on one or two subsequent days. Under such a plan it will be necessary to work out detailed arrangements through mutual conferences, both through the central office of the Association and between the different societies and groups taking part.

9. Depending upon conditions, clinics might be arranged from 7 a. m. to 10 a. m. Physicians would then give attention to private work and practice until 4 p. m. Then physicians taking a course would meet for clinics up until 6 p. m. Dinner and round-table discussions and intermission from 6 p. m. until 8 p. m. Clinics again from 8 p. m. until 10 p. m. The plan just outlined would be subject to modification according to local arrangements.

10. Association Secretary was instructed to correspond with the four undergraduate medical schools: the University of California, Stanford Medical School, University of Southern California, and the College of Medical Evangelists, relative to possible coöperation of these institutions in supplying staff members who would work out suggestive programs and teams.

Large hospital staffs in metropolitan centers were similarly to be consulted concerning possible coöperation.

Coöperation with the new Committee on Pneumonia Control was also authorized.

Coöperation with the California State Board of Public Health, with particular reference to maternal and child welfare, venereal diseases, and crippled children clinics was also authorized.

11. The program of the State Committee on Postgraduate Activities of the coming year is to be brought out as a supplement to either the October or November issue of California and Western Medicine.

12. The importance of preliminary publicity among physicians to insure a good attendance by local committees was stressed. This courtesy was due to visiting physicians. The Association Secretary was authorized to send postcards or other notification to physicians living in the district to be covered by a clinical conference.

13. The plan submitted by Dr. Charles A. Broaddus of Stockton concerning "The Medical Academy of Graduate Study" was discussed. The opinion of the State Committee on Postgraduate Survey is that the time has not arrived when such a plan can be put into operation on a state-wide basis. It is felt that whatever may be done along this line should be carried out through local county units, and if in practice the plan was found to be satisfactory it could be extended. In the meantime the State Committee on Postgraduate Activities favored plans that would make for local and self-administered study clubs and clinics.

John A. Ruddock, *Chairman.*
George H. Kress, *Secretary.*

COMMITTEE ON PNEUMONIA CONTROL

Report of Meeting at San Francisco
Saturday, August 27, 1938

A Committee on Pneumonia Control has been appointed and approved by the Council of the California Medical Association as a subcommittee of the standing committee on Health and Public Instruction under the chairmanship of Dr. Fred B. Clarke of Long Beach. The committee consists of Dr. Roy E. Thomas, Los Angeles, chairman; Dr. Edwin L. Bruck, San Francisco; Karl F. Meyer, San Francisco; Dr. Lambert B. Coblentz, San Francisco; Dr. George D. Maner, Los Angeles; Dr. Daniel D. Comstock, Los Angeles; Dr. William P. Shepard, San Francisco.

At its first official meeting at California Medical Association headquarters in San Francisco on August 27, 1938, the committee discussed the pneumonia situation in California and plans for control in the light of modern diagnostic and therapeutic procedures. The committee finds that the state suffers an average of 1,862 deaths from lobar pneumonia each year. There are over 4,000 deaths from all forms of pneumonia, many of the bronchopneumonias being pneumococcic in origin and amenable to serum therapy. It is estimated that nearly half of these deaths could be prevented with modern methods of rapid typing and prompt administration of serum. There are thirty-two types of pneumococcic pneumonia and fairly effective specific antisera are available for eleven, Types I, II, III, IV, V, VI, VII, VIII, XII, XIV, XVIII. These types account for a considerable percentage of the fatal cases.

Neufeld rapid typing is partially available in some of the metropolitan areas of the state, and the committee is working on plans to extend these services throughout the state, through the assistance of the State Department of Public Health, the medical schools, and hospitals. Therapeutic sera for the eleven types are becoming more available through the biological houses. The desirability of offering free serum for indigents is being studied by the committee.

The purposes of the committee were clearly set forth as:

1. Assistance of the Committee on Postgraduate Training in offering instruction on diagnosis and treatment to all county societies in the state.

2. Assistance of the State Department of Public Health in its pneumonia control program.

3. Coöperation with medical schools in offering short courses during the pneumonia season.

4. Coöperation with nursing and other organizations which participate in handling pneumonia.

5. Education of the public through county medical societies on the importance of seeking competent medical care early.

The committee feels that pneumonia mortality can be effectively reduced by the practicing physicians of the state once they are provided with facilities for typing, ready availability of serum, and competent nursing assistance. It is to be hoped that these needs will be supplied in the near future. The committee's program will be based on diagnosis and treatment by private physicians.

Of the 1,862 average annual deaths from lobar pneumonia in California, as based on vital statistics on record, 81 per cent occur in thirteen counties and 42 per cent occur in Los Angeles and San Francisco counties. Counties having over thirty deaths a year have the following percentages of the total deaths:

	Per Cent		Per Cent
Alameda	6	Sacramento	7
Fresno	3	San Bernardino	3
Imperial	2	San Diego	5
Kern	2	San Francisco	12
Los Angeles	30	San Joaquin	5
Orange	1	Santa Clara	3
Riverside	2		

COMMITTEE ON PUBLIC RELATIONS

The Committee on Public Relations held a meeting at the State Association headquarters office in San Francisco on Saturday, August 27.

For digest of proceedings, see this page, right column.

MEDICAL SOCIETY OF THE STATE OF CALIFORNIA

A meeting of the Board of Trustees of the "Medical Society of the State of California" was held in San Francisco on August 13.

Medico-legal problems and best means for their solution were considered. This organization has been receiving constant additions to its membership as the value of its services has become better known. On request to the Central Office, information will be sent.

COMMITTEE ON POSTGRADUATE ACTIVITIES

The members of the Committee on Postgraduate Activities convened in San Francisco on August 13. Plans for the fall and winter postgraduate conferences were discussed. Component county societies are requested to write to the Committee on Postgraduate Activities, Room 2004, Four Fifty Sutter Building, San Francisco, or to members of the committee, whose names will be found on advertising page 2 of every issue of California and Western Medicine. Suggestions are cordially invited.*

SUBCOMMITTEE ON PNEUMONIC CONTROL

This newly authorized committee is a subgroup of the Committee on Health and Public Instruction. It will also work in conjunction with the Committee on Postgraduate Activities.

A statement concerning its work appears on page 223.

CONFERENCE OF COUNTY SOCIETY SECRETARIES AND CALIFORNIA MEDICAL ASSOCIATION OFFICERS

In January, 1939, the California Legislature will begin its next session, and the usual mass of new statutes with public health implications will be presented. All proposed laws are submitted in January. The Legislature then goes into recess for one month.

The meeting of the county societies secretaries and the California Medical Association officers will probably be held at the end of January or early in February. It is possible that Los Angeles will be chosen as the place of meeting. At its October meeting the Council will decide upon the time and place.

* For additional information, see page 222.

CALIFORNIA MEDICAL ASSOCIATION ANNUAL SESSION FOR 1939, HOTEL DEL MONTE, MAY 1–4, 1939

The 1939 annual session of the California Medical Association will be officially opened on Monday, May 1, 1939, at the Hotel Del Monte, in Del Monte.

Members of the Association who have in contemplation the preparation of papers for that gathering should communicate promptly with either the Association Secretary at the State Association headquarters office, Room 2004, Four Fifty Sutter Building, San Francisco, or with the Secretary of the Scientific Section before which the paper is intended to be read. The names of members of the Committee on Scientific Work appear in each issue of California and Western Medicine, on advertising page 2.

Hotel reservations are also in order. The Hotel Del Monte cannot house all who desire to attend, and physicians who wish to be guests in that hotel should write the management at once. The address is Hotel Del Monte, Del Monte, California. Mr. Carl Stanley is the manager and Mr. Natt Head is the assistant manager. All hotel reservations for the Hotel Del Monte and its affiliated hotels will be handled through the Hotel Del Monte management. A full list of hotels with rates will be printed in the October issue of California and Western Medicine.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

COMMITTEE ON PUBLIC RELATIONS

Digest of a Meeting Held in San Francisco on Saturday, August 27, 1938

1. Members present: Doctors George G. Reinle, Oakland; Fred B. Clarke, Long Beach; William Earl Mitchell, Berkeley; George D. Maner, Los Angeles; John H. Graves, San Francisco; Junius B. Harris, Sacramento; Alson R. Kilgore, San Francisco; John C. Ruddock, Los Angeles; Charles A. Dukes, Oakland; George H. Kress, San Francisco; and Mr. Hartley F. Peart, San Francisco.

Doctors Morton R. Gibbons and Karl L. Schaupp of San Francisco were present during the discussion of special reports. President William W. Roblee was unavoidably detained.

2. Concerning a possible public health exhibit at the Golden Gate International Exposition in 1939, it was voted that such exhibit should include in its scope, if possible, cancer, tuberculosis, heart, and other public health problems. The exhibit to be presented as an expression of the Herzstein Bequest.

3. Dr. Fred B. Clarke of Long Beach was deputized to represent the California Medical Association at the Western Safety Conference at the Hotel Ambassador, in Los Angeles, September 12 to 16, 1938.

4. Special report was made by Dr. Morton R. Gibbons of San Francisco relative to a proposed medical and hospital reimbursement plan for employees of the Standard Oil Company of California. Discussion of plans of other oil companies was also had.

It was voted that a committee, consisting of Doctors Morton R. Gibbons (Chairman), Fred B. Clarke, and John H. Graves, be authorized to communicate with the Standard Oil Company concerning possible plans and procedures.

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. George G. Reinle of Oakland is the chairman and Dr. George H. Kress is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. George H. Kress, Room 2004, Four Fifty Sutter Street, San Francisco.

Correspondence regarding the Fireman's Fund Insurance Company was referred to the above committee.

Correspondence concerning fee schedules for physical examination of applicants from the California Department of Employment was also referred to the above committee.

5. Letter from Dr. Thomas J. Dozier, Secretary of the Contra Costa County Medical Society, concerning a "Co-operative Hospital Association Plan," was given consideration.

The Association's legal counsel, Mr. Peart, was requested to make a study thereof and to report thereon.

6. Information that had been gathered concerning the "United Provident Association" of Oakland was considered.

Similar discussion was had regarding an organization known as the "Doctors Medical and Surgical Group" of Los Angeles.

7. Copy of Legal Counsel Peart's reply to Dr. Hugh F. Freidell of Santa Barbara Medical Society, concerning the Pacific Employers' Insurance Company, was ordered sent to other component county societies for their information.

8. Approval was given to the modified rules of the Associated Hospital Service of Southern California.

9. A medical service at Palo Alto concerning which items had appeared in the daily press was given consideration. A special committee, consisting of Doctors Reinle and Kress and Mr. Peart, was authorized to call the attention of the Palo Alto group to the Association's rules governing coöperation of Association members in medical and hospital service plans.

10. Attention was called to the congressional amendment of the Federal Compensation Law whereby the scope of that act was extended to include osteopathic practitioners, who would hereafter receive recognition within the scope of their practice, as defined by their respective state laws.

11. It was voted to recommend to the Council the appointment of a special committee of three to act as a contact group to represent the California Medical Association in conference with a similar committee from the Association of California Hospitals. This conjoint committee to consider work, problems, and prospective legislation of mutual interest.

12. A letter from Dr. Karl L. Schaupp of San Francisco, representative of the California Medical Association on the Federal Farm Security Administration's "Agricultural Workers' Health and Medical Association," addressed to President William W. Roblee, was discussed.

It was voted that a copy of Doctor Schaupp's report be sent to each component county medical society, and that it also be published in California and Western Medicine.

13. Recess was had for luncheon.

14. At the conclusion of the luncheon it was voted that members of the Committee on Public Relations, the Committee on Postgraduate Activities, and the Committee on Pneumonia Control view two films presented on behalf of the Committee on Pneumonia Control: one for possible display to lay audiences in cinema theaters, ond the other for physician audiences.

With the general purposes of both films, the Committee on Public Relations was in accord. However, until such time as an adequate supply of serum adapted to pneumonia types met with in California is available and within the reach of physicians, it was felt it would be wise to proceed with caution in the display of the film intended for lay audiences.

15. Concerning the resolution, "To establish a committee outlining general policies of the medical profession," adopted by the House of Delegates at the May, 1938, annual session at Pasadena, a special committee, consisting of the Chairman of the Committee on Public Relations (Doctor Reinle), the President-elect (Doctor Dukes), the Chairman of the Committee on Public Policy and Legislation (Doctor Harris), the Association Secretary (Doctor Kress), and the General Counsel (Mr. Peart), was appointed to outline certain policies.

16. The action of the Executive Committee concerning coöperation in efforts designed to defeat the proposed "Humane Pound Law" was approved. The matter will be given further consideration and final action by the Council at its meeting on October 1, 1938.

17. The recent ruling of the Attorney General of the State of California concerning the legal right of internes to practice medicine was considered. Dr. Junius B. Harris was appointed a Committee of One to coöperate with the Board of Medical Examiners of California in efforts to correct deficiencies in the present situation.

18. Proposed conference with representatives of the Farm Bureau of California to be held on Saturday, October 1, 1938, was considered and possible topics on which an exchange of opinion would be of value were suggested.

19. The Committee on Public Relations concurred in the point of view of the Executive Committee, that the Conference of County Society Officers and Officers with Councilors of the California Medical Association should preferably be held in February, subsequent to the January session of the California Legislature; time and place of this meeting during the February recess to be decided by Doctor Harris, Chairman of the Committee on Public Policy and Legislation.

20. Letter from the Nevada State Medical Association concerning renewal of affiliation in so far as the official journal of the California Medical Association is concerned, was read. It was felt that such coöperation was desirable, but that it should be on a subscription cost plan that would include every member of the Nevada State Medical Association; and that as regards publication of papers read before the Nevada State Association the same general policy should apply as is used with members of the California Medical Association.

21. Voted that a special committee be recommended for appointment to develop plans for speakers' bureaus in the different counties. Chairman Reinle appointed for this work, Doctors George Maner, Los Angeles (chairman), Fred B. Clarke, Long Beach, and H. M. Behneman, San Francisco.

22. Voted that the Los Angeles County Medical Association through its secretary, Dr. George D. Maner, submit a report on its radio broadcasting work and that publicity be given thereon in the official journal.

23. The need of coöperation by component county medical societies in the collection of data for the American Medical Association survey on medical care was emphasized, and instructions were given that a letter be written to the component county societies urging such coöperation.

24. Approval was given to plans submitted by Dr. Selda E. Anthony of Independence, Inyo County, for the formation of a medical group to include Inyo and Mono counties, with the suggestion that such a society, if formed, make application in due manner to the House of Delegates in May, 1939, for a charter as a component county medical society.

25. The difficulty of appropriating moneys from the General Fund of the State Association to carry on special work of scientific sections (as, for instance, the excellent program that has been under way by the Committee on the Hard of Hearing of the Eye, Ear, Nose, and Throat Section) was discussed. Under present conditions the Committee on Public Relations did not feel warranted in recommending to the Council that the past policy be changed.

26. Report was made concerning the new committee representing the Section on Neuropsychiatry that was appointed by that section. The Section's committee is to make a study and submit recommendations for changes in California laws having relation to mental hygiene.

27. Serious discussion was had concerning the scope of operations of certain lay medical service organizations that were being conducted for profit. The subject was deemed worthy of earnest study and subsequent report.

28. During the meeting a telegram was received from Olin West, Secretary of the American Medical Association, announcing a special session of the House of Delegates of the American Medical Association to be held in Chicago, Friday, September 16, 1938. The Association Secretary was instructed to secure additional information.

George G. Reinle, *Chairman.* George H. Kress, *Secretary.*

"CALIFORNIA AGRICULTURAL WORKERS' HEALTH AND MEDICAL ASSOCIATION"

*Report of Karl L. Schaupp, M. D., Member of the Board of Directors, and Representing the California Medical Association**

August 27, 1938.

To Dr. W. W. Roblee, President, California Medical Association:

As a director of the "Agricultural Workers' Health and Medical Association" (referred to in CALIFORNIA AND WESTERN MEDICINE, June, 1938, on page 460), it became necessary for me to go to Fresno last week, and while there I studied the practical operation of the service. As you know, I am on this Board as the representative of the California Medical Association, and I, therefore, feel that I should make a report to you at this time.

* * *

There are several fundamental principles involved, and in our coöperation with the Farm Security Administration it may be wise to restate these:

1. The purpose of this service is to give medical aid to those farm workers who are without funds or employment and who have not been resident within our state for one year.

2. This is a group which, when it did receive medical care, became the burden of the physician who had not the heart to refuse such care and who received no compensation for his services. It has been a burden to the physicians and to the hospitals.

3. When the FSA (Farm Security Administration) was faced with the problem of medical care of the migrant, who had become a public-health menace to the citizens of California as well as a danger to himself, it sought the advice and coöperation of the California Medical Association. This advice was given, and coöperation was promised at our meeting of April 29, 1938, and since then has been freely given.

4. A fee schedule was adopted by the Board which is the same as that used by the SRA, and which was adopted by that agency upon the advice of a properly constituted Medical Advisory Committee. This fee schedule was not meant to be one such as would be used by an insurance set-up. It was meant to compensate physicians and hospitals for the cost of their services and to give them a little above that cost. It was understood that the profession was still contributing, in large part, a service to community welfare. It was never intended that any person should under this system make more than a small profit.

5. It has been the intention of this service to take care of *acute* illnesses and those conditions which might become a menace to the public health. It was never meant to be a clearing house for the complete medical and physical rehabilitation of a group of migrants who might next year be far removed from our state.

6. A major principle of the plan is that there shall be free choice of hospitals and a free choice of physicians from all duly licensed doctors of medicine who are *eligible* to be members of the California Medical Association.

* * *

With these fundamental points in mind, I would now like to give you a report on what the results have been and would like to make some suggestions for the county societies and for the members at large.

To begin with, the plan has been working most successfully. The patients are, for the first time, receiving adequate care from a physician of their own choosing. Most of the local physicians have been coöperating in a manner that is highly gratifying and have done so cheerfully.

Moneys to the extent of $50,000 and $55,000 have been paid out for medical care each month where before the cost of this care fell upon the private physician, the private hospital, and the taxpayer of the county in which the nonresident (who was also a nontaxpayer) found himself. Of this sum spent monthly, slightly over half has gone to the physician.

* * *

It is regrettable that a few, a *very* few physicians and hospitals, are making an effort to capitalize on this plan and are taking every possible advantage to increase their incomes without regard to the needs of the service. A few of the physicians are very evidently making an effort to *find* work. They are performing operations which are apparently not emergencies. For instance, slating eight tonsillectomies in one family on one morning; three circumcisions in one family in one morning (in cases where no acute condition existed); making daily house calls for ringworm and in other ways attempting to build up a volume of practice. That some of these conditions are not always acute and that certain physicians are building up volume is shown by the fact that many of these patients, including the family of eight for tonsillectomy, have moved out overnight to escape operation! Some have even left the hospital at night to escape surgery. I do not wish to give the impression that many men are following these practices, but the few who do, certainly jeopardize the whole plan by causing a great increase in cost and by making the public feel that the medical man cannot be trusted to conduct such a service honestly.

There are also little offenses, such as writing costly prescriptions, attempting to classify minor as major operations, charging an excess for assistants at operations, and the like, that tend to increase the costs. It is well to remember that the *costs* must be paid back again some day in the tax rate, be they local or national.

A very few hospitals have been charging excessively for drugs and dressings, but have greatly increased the cost. For instance, one hospital where the charge for bed and nursing care for twelve days was $48 charged over $25 for drugs, including one gallon of camphorated oil and enough aspirin, so that if the patient had gotten it all he would have received one tablet every twenty minutes for the entire time he was in the hospital!

The above practices can largely be eliminated by calling the attention of the profession to the facts, and I believe this should be done.

* * *

At our Board meeting yesterday it was decided to employ a part-time medical adviser from one of the Valley counties, who is to advise the executives of the central office of the corporation. This man will be chosen upon the recommendation of one of the county medical societies. He will be a physician who is familiar with the type of work that is done.

Fresno County has already named a Medical Advisory Committee to guide the nonmedical administrators and will be a logical group to whom the medical adviser can turn for advice and it would be the logical group through which discipline could be administered if it should ever become necessary. It is my suggestion that each county society of those counties in which this plan operates should name a similar advisory committee.

* * *

At the present time Kern County is not included in the working of this plan. We were informed that the county could take care of its own problem and that the extension of our services to that district was not desired. Added to this the "grant list" of FSA only had 356 names, which seemed to make the establishment of such a service unnecessary. In conversations with Doctor Packard, and from correspondence with Doctor Compton of Bakersfield, however, I feel that we have not been completely informed and that the need is there; and, if that is the case, I believe that we shall operate in that county, as in others, in the near future.

There is one other important feature about this work which should be generally known. Until the present time we have had no accurate knowledge of the cost of medical service in any insurance plan. In this piece of work we are getting that experience which will be of great importance in any future planning of health insurance.

Respectfully submitted,

KARL L. SCHAUPP.

* This report was submitted to the California Medical Association Committee on Public Relations at its meeting held on August 27. The report was ordered to be printed for the information of component societies and members.

COMPONENT COUNTY MEDICAL SOCIETIES

HUMBOLDT COUNTY

The Humboldt County Medical Society met on the evening of August 1 at the General Hospital in Eureka. President Francis M. Stump presided.

Twenty members were present. Visitors present were: Doctors Copeland and Norman Epstein, representing the State Venereal Health Department.

Dr. Wilson Stegeman of Crescent City gave a very able and well-received paper on *The Prevention of Postoperative Complications by the Giving of Glucose by Mouth Before Operations.*

Dr. Norman Epstein spoke on *Syphilis,* and outlined the part our Society can take in aiding the prevention of venereal diseases. This talk was very much to the point and well received.

LAWRENCE A. WING, *Secretary.*

LASSEN-PLUMAS-MODOC COUNTY

A vacation season meeting of the Lassen-Plumas-Modoc County Medical Society was held at the summer home of Dr. F. J. Davis, Sr., on Lake Almanor, Saturday evening, August 13. Members from Alturas, Susanville, Westwood, and Portola were present, representing a distance of two hundred miles.

After a fine dinner of barbecued steak, a general discussion and case reports were given. It is planned to hold another meeting in Susanville early in the fall for the election of officers.

FRED J. DAVIS, JR., *Secretary.*

LOS ANGELES COUNTY

The "Camp Transparent Woman," on display in the lounge of the Los Angeles County Medical Association, 1925 Wilshire Boulevard, Los Angeles, was viewed by nearly twenty thousand during the first four afternoons and evenings of its public showing.

A preview for the members of the Association and their wives and friends was held on Monday evening, July 25. Radio Station KFI, recognizing the widespread public interest in this educational exhibit, presented a fifteen-minute broadcast from the lounge of the Association at 9:30 o'clock Monday night. In this broadcast, Dr. Ralph B. Eusden, President of the Association, and Dr. George D. Maner, Secretary, were interviewed by Mr. Jose Rodriguez, editor of KFI, and Mr. J. Vandirveer, interviewer for the station.

Because of the publicity that preceded this broadcast and the radio area covered by KFI, more than five thousand persons passed through the buildings of the Association on Tuesday evening between the hours of 5 and 9:30.

The great reception given to this first broadcast resulted in Radio Station KFI presenting a second broadcast on Wednesday evening, July 27, at 9:45 o'clock. Particular attention at this second broadcast was given to the skeletal structure. Dr. Edwin B. Plimpton, orthopedic surgeon, was interviewed by Mr. Rodriguez. Mr. Vandirveer interviewed individuals in the audience, all of whom expressed their deep appreciation to the Los Angeles County Medical Association for presenting such a worth while, educational feature.

Because of popular demand the hours of showing were changed from 5 to 9 p. m. to 2:30 to 9:30 p. m. A brief lecture on the anatomy is presented at intervals of twenty minutes during the time of the showing.

Officials representing Mr. S. H. Camp, who was responsible for the creation of the Camp Transparent Woman, state that the reception being given in Los Angeles exceeds that of any other showing, not excepting that in the Rockefeller Center in New York, where the Transparent Woman was first exhibited in this country.

The value in public health education of this feature is very difficult to estimate. More than 70,000 individuals viewed the figure and heard the lectures before August 12, at which time the Camp Transparent Woman was taken to Portland, Oregon. Comments among the members of the audience were highly enlightening. Among them were these:

"I never thought that the kidneys were located so high. The next time I have a backache in the small of my back I am not going to take kidney pills; I am going to find out what's wrong."

"I am not going to take the medicine my neighbor recommends for a pain in the side. How does she know what's wrong with me?"

"I never knew I had a spleen before, and isn't it interesting to know something about the pancreas and diabetes."

Walking among the spectators, hearing their comments and noting their intense interest in everything said and shown, one realizes the intense desire for authentic health information and the great interest people of today have in their physical selves.

The audiences are impressed with what the science of medicine is doing, and leave with a better understanding of the complexities of medicine and the need for consulting a physician when they are ill.

STANLEY K. COCHEMS, *Executive Secretary.*

MENDOCINO-LAKE COUNTY

The Mendocino-Lake County Medical Society met on August 9 at Laurel Dell. The meeting was called to order by President Charles Craig. The following members were present: Doctors Toller, Cushman, Hill, Bramkamp, Beil, Gericke, Kirwin, Wagner, Smyth, Morley, Craig, Smalley, Thomas, Brink, and Mooy. The guests of the evening were: Dr. Epstein, Dr. Copeland, Dr. Harr, Dr. Curtner, and Louise Petty.

The members were urged to complete their studies of medical care and forward them to the secretary.

A splendid talk on *Syphilis* was given by Dr. Norman Epstein. The talk was illustrated by slides, and considerable discussion was elicited regarding the treatment of neurologic syphilis. Doctor Epstein explained the details of fever therapy as given at the University of California.

Before adjournment, resolutions were adopted thanking Doctors Epstein and Copeland.

An expression of opinion was obtained in regard to the desirability of having a scientific speaker for the next meeting. Sentiment was strongly in favor of having such a speaker, who was to be obtained by the president and the secretary.

The next meeting will be held in Willits the latter part of September. The date will be decided later.

The members were exhorted by Doctor Cushman to make every effort to attend the meetings and to get every eligible practicing physician in the counties to apply for membership.

ROBERT B. SMALLEY, *Secretary.*

In Memoriam

Carpenter, Frank Lossing. Died at Berkeley, May 16, 1938, age 70. Graduate of the University of Buffalo School of Medicine, 1891. Licensed in California in 1893. Doctor Carpenter was a member of the Alameda County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✝

Harris, Henry. Died at San Francisco, July 7, 1938, age 64. Graduate of Johns Hopkins University School of Medicine, Baltimore, 1899. Licensed in California in 1900. Doctor Harris was a member of the San Francisco County Medical Society, an honorary member of the California Medical Association, and a Fellow of the American Medical Association.

✝

Hull, James Porterville. Died at Stockton, July 23, 1938, age 66. Graduate of University of California Medical School, San Francisco, 1895, and licensed in California the same year. Doctor Hull was a member of the San Joaquin County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✝

Newcomb, Arthur Thurston. Died at Pasadena, July 18, 1938, age 66. Graduate of Baltimore Medical College, 1893. Licensed in California in 1899. Doctor Newcomb was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✝

Schwarz, Theodore Edward. Died at Oakland August 4, 1938, age 61. Graduate of the Medical College of Ohio, Cincinnati, 1900. Licensed in California in 1928. Doctor Schwarz was a member of the Alameda County Medical Association, the California Medical Association, and the American Medical Association.

✝

Simmons, Gustavus Crocker. Died at Inverness, August 8, 1938, age 75. Graduate of Harvard University Medical School, Boston, 1885. Licensed in California in 1886. Doctor Simmons was a retired member of the Sacramento Society for Medical Improvement, the California Medical Association, and the American Medical Association.

✝

Upshaw, Harry Thomas. Died at Pasadena, August 11, 1938, age 47. Graduate of St. Louis University School of Medicine, 1915. Licensed in California in 1926. Doctor Upshaw was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

OBITUARIES

Arthur Thurston Newcomb
1871–1938

"News of the passing of Dr. Arthur Thurston Newcomb came as a severe shock and brought sadness to the hearts of his many friends and patients, who recalled that it seemed but yesterday that they had been cheered by his jovial manner and winning smile.

"Active at the Huntington Memorial Hospital until he was taken ill on July 8, there were many who even were unaware of his illness until they learned that he had 'slipped away' early this morning. His wish during nine years of failing health that he might 'carry on to the end' had been granted.

"Doctor Newcomb was born in Killawog, New York, on December 8, 1871, the son of Franklin T. and Elizabeth Thurston Newcomb. After his regular preparatory education he was graduated in medicine from the University of Maryland in 1893, afterward taking postgraduate work at Johns Hopkins in 1893-1894. He studied research at the University of Chicago in 1898-1899 and at Johns Hopkins in 1903 and studied internal medicine and special courses in Vienna in 1912-1913.

"After serving as government physician and surgeon at Fort Mojave, Arizona, from 1893-1898, Doctor Newcomb came to California in 1900 and has been practicing in Pasadena ever since. For eighteen months during the World War he was chief of medical staff at the base hospital at Camp Kearny in San Diego. One of the founders of the Pasadena Hospital, Doctor Newcomb was the oldest serving member of the staff of the Huntington Memorial. He was one of the pioneers on the Pacific Coast in electrocardiography and fluoroscopy, bringing one of the first x-ray machines from Vienna in 1913.

"Doctor Newcomb was a life member of the American College of Physicians. He also was a member of the California State and Los Angeles County Medical Associations and the American Therapeutic Association; an early member of the Los Angeles Clinical and Pathological Society, and a member of the University Club of Pasadena.

"In the passing of Doctor Newcomb Pasadena has lost a well-beloved and highly respected citizen, a man whose love of people and community interest were paramount.

"He was blessed with a remarkably genial and optimistic temperament, and thereby, in his disposition, he inspired confidence and hope from the first moment of interview. He was deeply sympathetic, too, and shared with those who came to him, often with troubled minds and harassing fears, the emotions natural to the suffering human beings, and innumerable must have been the instances in which he kindly exerted himself, at cost of inconvenience and growing fatigue, particularly for those in straitened circumstances, and from whom he could never expect to be materially well paid. Thousands will miss the familiar face and voice of this distinguished citizen and man of humane science; consoled and strengthened only by the thought that Pasadena is so much the better for his life and decades of faithful and unselfish service here."

Henry Harris
1874–1938

The American Medical Association, and thereby its component units, lost a valued and respected member of the medical profession last July 7. Dr. Henry Harris, at the age of sixty-three, fell a victim to coronary disease, another doctor to fall from this frequent cause of death in our profession. Doctor Harris was known not only as an able practitioner of medicine, but as a student, and his inquisitive mind combined with a spirit of adventure gave him a full sixty-three years. He was a graduate of Johns Hopkins Medical School and followed this with a period of study in Europe. Doctor Harris was an outstanding example of many men of medicine who succeed in spite of illness; who, in fact, seem to be spurred on to greater study and accomplishment because of their own bodily infirmities.

Doctor Harris was widely known as a student and lecturer in the history of medicine, and I can speak from personal experience that he was never too busy to discuss this interesting phase of medicine. He was an honorary member of the San Francisco County Medical Society; he established and was the first librarian of that society; he published a widely read book, "California's Medical Story"; and he was at work, with Dr. Karl Meyer, on a history of bacteriology in the West.

Whether you agreed with Doctor Harris or not, you were completely disarmed by the charm of his presentation and the immediate conception that whatever he told was with a profound depth of sincerity. Doctor Harris was an able consultant, but with it a general bedside family doctor of whom Osler would have been proud. He leaves a wife, two daughters and a son, and they may continue on with the happy knowledge that throughout California, wherever Doctor Harris was known, he will be missed as a sincere and true apostle of Hippocrates.

H. M. F. Behneman, M.D.

✝

Joseph M. Swindt
1906–1938

Joseph M. Swindt died by his own will at Olema, California, on July 8. He was born in Pomona and was graduated from Pomona College and the Cornell University Medical School. He interned at the San Francisco City and County Hospital, and later was assistant resident in surgery there and at the University of California Hospital. His father, Joseph K. Swindt, until retirement from ill health a year ago, was one of the most eminent and respected surgeons of Southern California.

In 1936 he started practice in Chino and nearby Pomona, California. He was a well-trained, capable and highly conscientious physician. With the true spirit of the ideal physician he devoted his life to his patients. Forever striving to increase his knowledge and improve his results he was never satisfied with less than perfection. He felt a personal sense of responsibility in the presence of nature's as yet unsolved problems. In his own words, "I am not afraid of death—it is an old friend." In his passing many California physicians have lost a cherished friend and highly respected colleague.

Lewis T. Bullock, M.D.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION †

MRS. FRED H. ZUMWALT.....Chairman on Publicity
MRS. FRANK H. RODIN....Assistant Chairman on Publicity

Health Education

Modern science has made the world, and particularly our cities a far more convenient place in which to live than it was only a generation or two ago. The chemist, the physicist, and the engineer take a proper pride in the fact that their discoveries and inventions have facilitated travel and other forms of human activity and have enormously increased the production of wealth. The extent of the benefits that they have conferred upon civilization may be estimated by considering the difference that it would make to our city if it were suddenly deprived of one or more of these inventions or discoveries.

Yet, great as would be the inconvenience involved, the loss of electricity or any other product of physical science, the changes in the condition of life would be small compared with those which would result from the loss of modern medical science.

It would be a matter of life and death for the greater part of the inhabitants of every city, large and small. Pestilences would return and epidemics would sweep across the country, and within a decade the greater part of the population would have been wiped out. If the measures of preventive medicine were lost, if drinking water were no longer protected or purified, if the sanitary disposal of sewage were not practiced, if vaccinations were discontinued, every facility for rapid transportation would be equally effective for the rapid spread of disease. Diseases now almost forgotten would return to take their place with the existing pestilences. Surgery would be the brutal operations of the ancients without anesthetics. Asceptic ob-

† As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Frank H. Rodin, Assistant Chairman of the Publicity and Publications Committee, 2457 Bay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Rodin, and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

stetrics would be replaced by the medieval midwife or the unsanitary hospital with an enormous death rate from child-bearing fever.

In spite of the fact that the benefits of both physical science and medical science are vital to modern civilization, many people take quite different attitudes toward these essentials.

Unfortunately, in many cases the attitude toward medical science is not merely one involving a lack of enthusiasm and indifference to the benefits conferred, but is rather one of active opposition. The antivaccinationists, for instance, oppose one of the most essential and best proved measures of preventive medicine, and it is due to them that smallpox still persists. The antivivisectionists oppose medical investigation, both for new knowledge and for knowledge already won.

There are two philosophies of medicine: The primitive or superstitious and the modern or rational. Many of the people who oppose modern medical science still cling to the philosophies of primitive medicine which are deeply rooted in human character. The belief is that disease is caused by supernatural forces and associate disease with sin, and attempt to control them by ceremonial and superstitious measures, or to drive them away by wishful thinking. Intelligent man recognizes that knowledge is the sole means of preventing disease. The measures he relies upon to prevent and cure are those which have resulted from scientific investigation and have been proved to have been effective by experience.

The transition from primitive to rational medicine is seen in many ancient civilizations. The prophet Moses drew up a rational sanitary code, but it is typical of the stage of civilization in that he built his sanitary code into the religion of his people. In the fifteenth century B. C., Hippocrates, the greatest of all physicians, separated medicine from religion. He relieved the gods of the responsibility for disease and placed it squarely upon the shoulders of man. The history of medicine, from Hippocrates to the present time, is the record of the extent of man's acceptance of his responsibility. He gave rational medicine the general form it holds today. He laid down certain principles of science upon which modern medicine is built. These principles are in substance: There is no authority except facts. Facts are obtained by accurate observation. Deductions are made only from facts.

Therefore, as doctors' wives should we not avail ourselves of the opportunity and privilege to study and learn what we can of these facts so that we may be instrumental in developing a better understanding of scientific medicine among the women in the community in which we live?

Our president, Mrs. Clifford Andrews Wright, states that women are being recognized more and more as an influence in the affairs of the country, and as doctors' wives must be prepared to take their place in the community and keep growing mentally to meet the ever-changing needs.

Since no profession is more spiritual than rational scientific medicine in its ministrations to the needs of mankind, it is essential to be informed and well armed with facts if we are to be able to reach out into lay organizations to foster the aims of the medical profession and to help guide the health opinions of lay organizations. It is important for those who can to become active members in women's organizations in order that they may with dignity and knowledge inform the members of the difference between scientific medicine and quackery should the opportunity arise.

Many initiative measures pertaining to health—some good, some bad—are introduced each year in the California Legislature. In studying these bills and amendments we can familiarize ourselves and keep in touch with the trends affecting scientific medicine.

MRS. FRANK H. RODIN.

Milk Facts.—The dairy industry's importance to the national economic system is graphically visualized in the new "Milk Facts" booklet issued by the Milk Industry Foundation, Chrysler Building, New York.

Charts show that the United States is one of the ranking nations in the consumption of dairy products. With per capita consumption of fluid milk at 153 quarts a year, America tops all other countries except Switzerland with 232 quarts.

Annual per capita milk consumption in quarts for other nations is: Denmark, 144; Czechoslovakia, 136; Netherlands, 120; New Zealand, 112; Great Britain, France, and Germany, 92; Australia, 88; Belgium, 68; and Italy, 28.

"Milk, in one form or another, comprises over 25 per cent of the 1,500-odd pounds of food used each year by the average American," says the booklet. "It requires about ten and one-half quarts of milk to make a pound of butter and four and one-half quarts to make a pound of cheese. Approximately 350 million new milk bottles are purchased annually."

The booklet contains pictorial charts and figures showing the importance of the milk industry to the country's economic picture. Diagrammatic charts illustrate how the United States utilizes its milk supply of some 48,777,000,000 quarts of milk a year.

Fluid or fresh milk, which provides the farmer's highest cash return, accounts for 29.2 per cent of the country's yearly production. Creamery butter takes 31.6 per cent, farm butter 10.5 per cent, while 12.1 per cent of the milk is used on farms where produced. In making cheese, 5.9 per cent of the total milk is used; ice cream, 2.3 per cent; and canned milks, 4.3 per cent, according to charts.

Another chart shows a breakdown of the distributor's milk dollar based on recent certified accountants' figures prepared for the New York legislature. This shows that 44.03 per cent of the dollar goes to dairy farmers for milk; 26.16 per cent to labor; 8.75 per cent for supplies—bottles, cases, trucking, etc.; taxes, 2.24 per cent; depreciation, 2.40 per cent; profits, 2.98 per cent; salaries, less than one-half of one per cent.

"Within less than fifty years," says the booklet, "the production and utilization of milk have so increased in this country that today we are the greatest of dairy nations.

"Milk is our most widely used food, the farmer's largest source of cash income and the basis of an industry which for service and volume has few equals.

"Basic data about the nation's milk supply, the producers and the cows which create the supply, the distributors whose safeguards and efficiency have made wide usage possible, and the consumers of this 'most nearly perfect food' are of wide interest.

"Around twenty-five million cows are milked daily on three-quarters of the nation's six million farms—more than forty-five million quarts of milk are delivered to homes and stores. Milk, cheese, butter, ice cream and other dairy products create an estimated annual output of three and one-half billion dollars.

"The statistical background for this vast industry of wide ramifications should lead to a clearer understanding of milk economics."

Government Continues Seizure of Poisonous Eyelash Dyes.—The Federal Government is continuing its seizure of poisonous eyelash dyes. On the recommendation of the Food and Drug Administration of the Department of Agriculture, Federal District Attorneys at New Orleans, Louisiana, and Houston, Texas, recently caused the seizure of consignments of "Magic-Di-Stik Lash and Brow Dye," manufactured by Dependable Concentrated Cosmetics, Inc., Los Angeles, California. Another lot at Memphis, Tennessee, is being proceeded against. The Government charges that this product is adulterated within the meaning of the recently enacted Federal Food, Drug, and Cosmetic Act because it contains paraphenylene diamin—a poisonous coal-tar preparation which may cause serious eye injury or even blindness to users.

This product is in many respects similar to "Lash-Lure," the preparation which was the first article seized under the new law. Many injuries have resulted from the use of preparations of this type because, until the new statute was passed, the Government had no control over cosmetics, and traffic in these dangerous preparations was allowed to flourish.

The distributors of Magic-Di-Stik, like those of Lash-Lure, enclosed in each package slips to be signed by customers designed to absolve the beauty shop distributor and manufacturer from any liability if the use of Magic-Di-Stik results in injury.

While most of the provisions of the Food, Drug, and Cosmetic Act do not become effective until one year after June 25, 1938, the interstate shipment of dangerous cosmetics is immediately prohibited.

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

Thursday, September 29—KECA, 11:00 a. m., The Road of Health.

Pellagra in California.—An analysis of 520 cases of pellagra reported in California from 1928 to 1935 has been made by Dr. Charles E. Smith of the Department of Public Health and Preventive Medicine, Stanford University School of Medicine, and Ida May Stevens of the Bureau of Epidemiology, California State Department of Public Health.

A total of 942 cases of pellagra were reported to the California State Department of Public Health during the years 1920 to 1935. Histories were requested covering 627 cases reported during the years 1928 to 1935, and 520 of this group were selected for study.

Pellagra is due to the use of a diet lacking in vitamin G. In southern states outbreaks resembling epidemics are common. In California cases are sporadic, and there is never any suggestion of epidemics in the appearance of the disease. In California, as in the southern states, pellagra is more prevalent in the spring and early summer than during the other seasons of the year.

*County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

Inter-State Postgraduate Medical Association.—The International Assembly of the Inter-State Postgraduate Medical Association of North America will be held in the public auditorium of Philadelphia, Pennsylvania, October 31, November 1, 2, 3, and 4. A list of the contributors to the program may be found in the advertising section of this journal, on advertising page 28.

The Medical Corps Reunion in Los Angeles.—One of the features of the 1938 American Legion Convention which will be held at Los Angeles, September 19 to 22, inclusive, will be the Medical Corps reunion in which the Army, Navy, Marine Corps, Air Service, and Dental Corps of the Army are coöperating. Luncheon will be held at the Cocoanut Grove of the Ambassador Hotel, 3400 Wilshire Boulevard, Los Angeles, on Wednesday, September 21, at 12:30 noon. The nurses and enlisted personnel of all the Services are invited, as well as wives or husbands of medical delegates to the National American Legion Convention. Further information can be obtained from Charles W. Decker, M.D., Medical Corps Reunion Chairman, 3400 Wilshire Boulevard, Los Angeles.

New Era Opens for People with Hearing Defects.—New technique and additional knowledge in the field of audiometry which may be hailed as a boon to the great mass of people afflicted with defects of hearing was described to physicians and surgeons, members of the American Medical Association, in annual meeting here. Research and investigation over a period of years now makes possible the correction of defective hearing on much the same plane that correction of sight defects has been established.

Two men who have made important contributions to this development and who reported their findings today are Dr. Isaac H. Jones, Los Angeles physician, and Dr. Vern O. Knudsen, physicist and acoustician, at the Los Angeles campus of the University of California, their report being entitled "What Audiometry Can Now Mean in Routine Practice."

The paper calls attention to the fact that physicians are known to be devoted to every phase of their work except in the one field of service to the hard-of-hearing, and explains the blame for this should probably be divided about equally between practitioner and patient.

"We are now able, with precision, to measure and diagnose conditions of the middle and internal ear and to treat them intelligently," states the report. "We can also, as the ophthalmologist has done for so many years, prescribe the type of aid with which each patient will hear best; and in many instances we can secure an instrument that will meet our prescription. The instruments of precision for diagnosis are available and yet very few of us use them.

"It is freely admitted everywhere that a careful study of a hard-of-hearing patient should include the vestibular tests and audiometric tests with a standardized audiometer in a soundproof booth. Another test which we have found of such value that we have used it routinely for fifteen years—a study of the middle-ear mechanism by a pneumatic oscillator with an electric otoscope."

The test makes it possible to "see the ear hear," which, to a great extent, can be accomplished in clinical practice. Audiometry is now beginning to be recognized as a legitimate and necessary part of the practice of physicians, the paper points out, and equipment including an audiometer is necessary. Standards for an acceptable audiometer are set forth, with the statement it is now possible to purchase one that will not be outdated and obsolete for five or possibly ten years.

American Association of Medical Milk Commissions. Dr. John P. Nuttall of Los Angeles and Wilson H. Lee of New Haven, Conn., were elected presidents of the American Association of Medical Milk Commissions and the Certified Milk Producers Association of America, respectively, at the joint annual conference of those associations recently held.

Dr. Nuttall is chairman of the Los Angeles County Medical Association Milk Commission. Mr. Lee, 86 years old, is one of the oldest active certified milk producers in the United States. He owns Fairlea Farms, Inc., Orange, Conn., and was president of the C. M. P. A. A. for three years, about twenty years ago.

Highlights of speeches before the conference follow:

A new deal in human nutrition is needed in this country for a real economic recovery, Dr. James A. Tobey, New York nutrition expert, declared. He advocated a diet with a much higher consumption of milk, bread, fruits and vegetables than is now normally consumed, and with less sugar. This would provide a distinct improvement in our national vitality and would be of great benefit to American farmers, fruit growers, dairymen, millers and bakers.

The garden, the grocery, the orchard, the dairy, the butcher shop and the great out-of-doors—rather than the drug store—should be depended on in great measure to supply our dietary needs, Dr. Nina Simmonds of the University of California told the conference.

Diets inadequate in vitamin C intake are not at all uncommon in the United States, C. C. Davis, laboratory director for the New Orleans Medical Milk Commission, declared. Certified milk is a good source of vitamin C at the time it is produced, Mr. Davis said, but the problem seems to be one of conserving the vitamin.

Scurvy is occurring with sufficient frequency to warrant serious consideration, Dr. R. Cannon Eley of the Boston Medical Milk Commission said. In a recent ten-year survey made at the Infants and Children's Hospital of Boston from 1926 through 1935, 314 cases of this disease were treated. In 1926 there were thirty-two cases and in 1935 there were thirty-eight cases. Twelve of the leading Boston hospitals now use certified milk in the preparation of all infants' formulas.

A detailed study of bovine mastitis is being conducted by the Veterinary Science Division of the University of California, Dr. Oscar W. Schalm of that university reported. It is a more complete study than any made to date.

Heat processing of cow's milk seems to have a tendency to interfere with the bone development of children, while raw milks apparently encourage normal bone and physical development, Dr. F. M. Pottenger, Jr., of Monrovia, Cal., said.

Addition of pasteurized milk to the certified milk list provided the ultimate in safety and goodness in milk for public consumption, Dr. K. H. Sutherland, health officer of Orange County, Cal., declared. "By so doing, you are providing the ultimate in safety and goodness in milk," he said.

The general milk supply of the nation has been steadily improved through the example set by certified milk, Dr. J. Howard Brown of Johns Hopkins Hospital, Baltimore, asserted. Doctor Brown quoted from many prominent authorities on the importance of certified milk to the dairy industry.

Competitive use of certified milk with other milk grades, so that a large group of feeding cases of babies could be made available for statistical comparison, Dr. Harold L. Barnes of Brooklyn, N. Y., chairman of the Kings County Medical Society Milk Commission, urged. The use of certified milk in Brooklyn is increasing steadily, Doctor Barnes said.

Increasing interest is being shown by the medical profession in homogenized soft curd milk which should be supplied in the form of certified milk—homogenized, Dr. Irving J. Malcolm of Philadelphia Children's Hospital declared.

Importance of proper diet in the treatment of such diseases as arterial sclerosis, skin diseases, syphilis, night blindness, migraine, neuritis and anemia was stressed by Dr. J. C. Norris, president of the Fulton County Medical Milk Commission, Atlanta, Ga.

American Board of Internal Medicine, Inc.—Written examinations for certification by the American Board of Internal Medicine will be held in various parts of the United States on Monday, October 17, 1938, and on Monday, February 20, 1939.

Formal application must be received by the secretary before September 15, 1938, for the October, 1938, examination, and on or before January 1 for the February, 1939, examination.

Application forms may be obtained from William S. Middleton, M. D., Secretary-Treasurer, 1301 University Avenue, Madison, Wisconsin.

American Board of Obstetrics and Gynecology.—The next written examination and review of case histories of Group B applicants by the American Board of Obstetrics and Gynecology will be held in various cities of the United States and Canada on Saturday, November 5, 1938.

The next general examination for all candidates (Groups A and B) will be held in St. Louis, Missouri, in June, 1939, immediately prior to the American Medical Association meeting.

Application blanks and booklets of information may be obtained from Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh (6), Pennsylvania. Applications for these examinations must be filed in the secretary's office not later than sixty days prior to the scheduled dates of examination.

General Training Stressed in University Medical School.—"What the public needs is not the specialist, but a health coördinator, physician, psychiatrist, and confessor all in one; in other words, a general practitioner," Dr. S. P. Lucia, assistant professor of medicine at the University of California Medical School, declared in explaining the school's organization of curriculum.

Doctor Lucia, writing for the *Journal of the Association of American Medical Colleges*, outlines the organization of the senior curriculum, which has been evolved from experiments begun in 1923. Under this plan the work of senior students is conducted primarily in the out-patient department of the University of California Hospital.

Here approximately twenty-two thousand patients, a third of them from communities throughout the state, are accommodated each year. In the out-patient clinic the students, under the guidance of a consulting staff, assume the full duties of practicing physicians. Clinical demonstrations replace lectures almost entirely, and students spend most of their time attending and studying selected patients.

In order to impress upon the student that, as a physician, he is responsible for his patient, Doctor Lucia said, he not only takes care of the patient assigned to him in the clinic, and accompanies the patient to special clinics for consultation, but also assumes direct charge of the patient should he be transferred to the hospital proper.

University of California Clinical Method Proves Successful.—The success of the University of California Medical School's plan of training senior students under conditions approaching those which they may expect to meet in the practice of medicine is attested by the frequent return of graduates to spend additional time in the University's clinic, according to Dr. Frederick S. Bruckman. Doctor Bruckman, assistant clinical professor of medicine, made this appraisal of the success of the University's system in a report to the *Journal of the Association of Medical Colleges.*

In the out-patient clinic of the University of California Hospital, Doctor Bruckman explained, senior students are trained in the care of patients under the supervision of a medical staff. In addition to the opportunity which this provides the student of participating, under supervision, in the actual practice of the profession for which he has prepared, the plan assists the student in gaining an understanding of the problems of the patient as well as of the physician. The success of the system is also attested, Doctor Bruckman said, by the fact that many graduates of the school refer eligible patients to the clinic for treatment in cases which cannot be accommodated by the health services of their local communities. A large proportion of the patients cared for at the clinic come to it from areas outside of San Francisco.

Institute on Health Draws Many People.—More than three hundred persons, from various parts of California, attended the Institute on Community Health Education, held on the Los Angeles campus of the University of California. The affair was sponsored by the Los Angeles Tuberculosis and Health Association, and was conducted by Dr. Ira V. Hiscock, professor of public health at Yale University, and a member of the Summer Session faculty at Los Angeles.

All phases of health education were considered at the meeting, which continued for three days. The organization of a balanced community health education program was outlined by Doctor Hiscock. The value of the radio, motion pictures, newspapers, exhibits, and group contacts, were considered.

Rosenberg Gift Provides Vital Health Study.—Through the generosity of the Rosenberg Foundation of San Francisco, the University of California is to be equipped with a laboratory for the study and control of a condition in the rodent population of the state known as sylvatic plague. The Foundation has contributed a total of $24,000 for the study, $14,000 of which is going into the construction of the laboratory building and the remainder into research and personnel. The building will be located immediately east of the present building of the Hooper Foundation for Medical Research, a part of the University's medical center in San Francisco.
